AFTER the traveller has refreshed himself by a draught of the clear cold water of the source of the Dee, the natural ambition of mankind may prompt him to attempt the ascent of some one of the surrounding hills. We say to *attempt*, for the ascent of a rough surface, at an angle of about 25 degrees with the surface of the earth, to the extent of some two or three thousand feet, is no trifling matter; and people of no contemptible powers have sometimes failed in the accomplishment of their purpose, especially when they have been in a hurry. As a sincere friend, experienced in the geography of the spot, we would advise you to try your efforts on Benmuichdhui, which is the easiest in the ascent, and will best repay the labour. The ascent is as nearly as such things generally are, to a straight line, uninterrupted by those petty plains and vallies which too frequently persuade the weary traveller that the surface of hill which bounds his view is the wished-for termination of his labours. Your eye will teach you at a glance the most accessible mode of ascent, which you will find to resemble a great ill-constructed stair of unhewn blocks of granite, some mile or so in length. Some of the steps are rather large, and formed without much attention to the convenience of fastidious pedestrians, and require the exercise of a little agility; and in skipping from one to another, we advise the ambitious climber, especially if he has some less active companion trudging behind him, to take special care not to remove any of those ruthless blocks, as any one of them might carry off his friend as unceremoniously as if he had been lashed to the mouth of a cannon, and make a sad figure of him ere both have reached the source of the Dee. At this period, a curious formation of the hill, interesting from the circumstances with which it is connected, will attract the attention of the traveller. It is now pretty well known that those frightful floods, which, in intervals of a good many years, have rushed from these alpine regions to carry terror and ruin into the glens beneath, are caused by the great cisterns of water hid in the stony bosoms of the hills, and supplying the springs and the sources of the rivers, having burst their bonds, from the pressure caused by heavy rains. The marks of these sudden overflowings are here very distinct. Deep gashes have been cut into the sides of the mountain, as if the work of some gigantic ploughshare, which has torn seams in the earth from twenty to forty feet deep, throwing up on each side great stones of many tons weight. The gashes which accompanied the floods of 1829 are marked by the redness of the newly turned-up gravel, contrasted with the purple heather, and the grey stones, bleached by the exposure of centuries; but a little alteration will show others of a similar description, now grey and hoary, like the other parts of the mountain, formed by the similar convulsions of ages long preceding. By degrees you are introduced to a different element, and to correspondingly different vegetable productions. The heather and long fern no longer impede your progress; and you sometimes walk over a deep-cushioned carpet of alpine mosses, short and stunted, but rich in variety of colouring, and fresh and moist from the recently melted snow; then you pass over a broad field of snow, hard as ice, and under which, from a puny archway, trickles some small stream, which feeds the river beneath. In the hottest noon of a summer day the summit is cold and wintry; the various gentle breezes which fan the sides of the warm vallies, will here be found concentrated into a swirling blast, cold and piercing as if it had sprung from the sea on a December morning; then the snow appears in large patches, wherever you look around you, and the bare surfaces of the rocks are deserted even by the alpine moss. We know no mountain so embedded among others as Benmuichdhui. On all sides it is surrounded; and the eye, fatigued with tracing their distant outlines, feels as if the whole earth were covered by such vast protuberances. Betwixt these hills, and over their summits, you will see the clouds wandering about like restless beings who have no fixed habitation, sometimes mounting high in the air, and dissolving into a few sputtering drops of rain; then forming a huge round ball, which is tossed by the wind from brow to brow. Beware of allowing one of them to surround you, for it will pierce your flesh as if with daggers of ice; nor would we particularly advise you to throw yourself in the way of a Highland shower from one of these cisterns. If you have the misfortune to be so overtaken, you are aware of your situation from the sudden blackness of the canopy over your head—you hear something like a distant faint rumbling from above—the flood-gates of the cistern are opened—and down come the contents, like the emptying of a thousand buckets. An umbrella is useless; before you have mounted it, the whole is over; the cloud is entirely dissolved; and were it not that you are drenched through all your clothes, you would hardly recollect that such a thing had been. If we might be allowed so much liberty, we would venture to recommend to you not to return by the same side of the mountain as that you ascended; we shall lead you through a track which will well repay a little fatigue. Benmuichdhui, stretching over a considerable space, has many summits, and presents a vast variety of aspects; but there is a certain part towards the north-east where it turns itself into a basin, joining the contiguous summits of Benaun and Benabourd, and where it assumes a form peculiarly striking and grim. Here one rock distinguishes itself from its brethren, by displaying a pointed needle from a summit of vast height, which appears considerably off the perpendicular, and hangs its head over the glen below. Betwixt this wild height and another bolder and broader, there is a deep fissure, down which tumbles a considerable stream, which, after forming itself into Lochaun, descends to join the Spey. The fissure through which this stream passes might not unaptly be compared to the cleft in a cow's hoof. In this narrow space the stream tumbles from the edges of high precipices, and sometimes skims with magic velocity over the surfaces of sloping ledges of rock. After a very tiresome, and, be it spoken, somewhat dangerous descent, the effect of the whole may be taken in at one view—a mighty waterfall, which seems to lose its head among the clouds. Leaving the thundering environs of this troubled stream, you are beside the banks of a calm blue transparent lake, deeply bedded among the lofty rocks we have described, and whose pellucid and tranquil waters are seldom visited by the wind. Here all is a profound and death-like stillness—the high rocks thousands of feet overhead, the deep unruffled lake at your feet, with its beautiful sand-banks and little bays, contrasted with the rugged objects which seem placed around to preserve so sweet an object from the turbulence of the Highland elements. That lake is Lochaun, a spot seldom visited, and classical from the notice of only one poet—James Hogg. But here, since we have come across the subject, let us just ask the shepherd what has prompted him, beyond the usual licence of travellers, to multiply by ten, and maintain Lochaun to be twenty miles long? True, he states in his notes to the Queen's Wake, by way of deprecating explanation, that "his mind during the whole day experienced the same sort of sensation as if he had been in a dream;" and we can easily guess at the physical cause of the feeling: but, after all, doubling the extent might have been quite sufficient; making twenty miles of two is a bold step. Reader, did you ever see an eagle?—we mean not a poor unhappy sovereign of the air chained to a kennel in a poultry-yard, to devour all the rats and mice which infest the house, but an eagle in his own domain, fearless of man, and keeping the world around him in awe? Here you may have a chance of meeting his most feathered majesty; he is either seated on the summit of a projection of stone, cocking his eye at the sun, and filled with thoughts we would give something to be at the bottom of, or he has spread his huge sails, and gone a privateering across the lake, where we wish him all success.

After wandering for a few miles by the banks of the wild clear rivulet which flows from Lochaun, you enter Glenlui, a spot whose features it is difficult to describe. You do not find here the same savage grandeur which marked the rocks at the source of the Dee; but there is, if possible, a feeling of still more impressive loneliness in the aspect of the brown hills, the grey stones, and, above all, the huge hoary gnarled pines. The great trees on the banks of the Dee are gradually falling before the axe; but here no temptation has been held out, and the forest remains in its pristine majesty. The huge rocks you have just witnessed defy the efforts of the art of man, and may probably, according to all calculation on human efforts, remain unappropriated, and as they came from the hand of the Creator, to the end of time; but here are the choicest materials of wealth and commerce, left to grow, and rot, and succeed each other, from age to age, untouched, from their sheer unapproachableness; and in one spot at least, in the thickly-peopled island of Britain, you are entitled to feel yourself as in those trans-Atlantic forests, where the best gifts of nature are made for the elements and the beasts: nor are you less struck and interested by the herds of beautiful red deer, who tread the forest unmolested, and gaze on the face of man, as on some unknown being at whom they have not learned to be afraid. Gradually the glen widens, and the trees grow fewer, but there is the same air of quiet and loneliness. Let us conclude our description of this curious spot, in the words of a late northern periodical, the only work we believe which has noticed the sequestered Glenlui.

"Gradually the sides of the glen begin to recede; the banks of the stream become more level; the trees grow less thick, and at last straggle wide apart, and, emerging from their shade, the glen, stretching in all its length, extent, and loneliness, meets your eye. Glenlui is about five miles in length, and without one house within it. The banks on either side of the valley rise steeply to the height of perhaps six or seven hundred feet, are covered with heather, and in some places, at the time we were there, the snow was lying in hollows near the summit. The bottom of the valley is a fine level haugh, of about a mile in breadth,

covered with rich luxuriant natural grass. The stream, one of the purest you ever saw, wends in many a turn and bend from side to side of the valley, brawling over rock and stone, or gliding gently over fine yellow sand, and in its banks, strewed with shining stones, bearing vestiges of its inundations. Add a few little knolls scattered along the bottom of the glen, and crowned with green trees, and a half-starved melancholy looking pine here and there struggling for existence half-way up the banks, and you will have some idea of Glenlui."

THE DEAD-LETTER BOX.—No. II.

At the corner of Captain Graham's bungalow (as a cottage residence in India is called) there was a large banian-tree, or Indian fig, beneath which he had a seat placed, and to which we now repaired for the coolness and fresh air. The tree was large, and afforded us a delightful shade under its wide arms and large bay-like leaves. It had none of those young stems or trunks shooting down from its branches for which this kind of tree is so celebrated, the goats, which are continually roaming about, having bitten off their tender points as often as they came near the ground; and at the very time while we were sitting, an animal of that kind, which Captain Graham had had with him, for the sake of its milk, during his campaign in Guzzerat, was standing upon its hind legs, and reaching as far as it could stretch its neck, to nibble at some of the descending shoots. Graham made a motion to strike it with his cane, but the little animal did not seem at all alarmed, and only made a fashion of retiring for a step or two, after which it immediately began to hop about, and browse with the same activity as before. "I could hardly strike her any where," said he, "and least of all under a banian-tree. When I was last in Guzzerat, I believe I should have died had it not been for her milk, and the shadow of these delightful trees. I was taken ill during the time we were in the field, and was obliged to be carried, while in a high fever, in a palanquin, under the heat of a burning sun, and amid the hot sands, till I was almost deprived of my senses. You cannot imagine at these times the delicious coolness and relief which I experienced when my bearers could halt for an hour under a tree of this kind, with its thick broad leaves, and wide branches, which never allow the soil beneath them to be heated by the most burning sun. The natives, indeed, believe that the coolness under them is owing to their being the favourite retreat of some of their gods or spirits. At such halts, a little tea, with the milk of poor Bukree, was the only luxury I could enjoy, and I assure you it was delightful. The goat has always been a favourite with me since."

"I do not wonder at it: and she must have been a very convenient camp follower, if she was as ingenious in foraging for herself every where as she seems now."

"That was what made her valuable; the desert itself was no desert to her, for the veriest sand always afforded her some root or stump that was eatable. She belonged to Mr Browne, a friend of mine, who died lately. By the bye, there must be some letters of his in that melancholy dead-letter box."

I had brought the box with me in order to look into some of the packets, and, on turning them over, soon found one labelled, "A. Browne, Esq. Rocket Brigade."

"Yes, these are the letters," said Captain Graham. "Browne's history had something in it not common in this country. He did not come here a boy, as most of us do, but was, when he arrived, a person between twenty and thirty, and had rather, I believe, been baffled in his prospects at home. He was much liked by the colonel for his happy convivial qualities, and was for some years the very centre of all the glee and humour of our mess-table. In truth, both from his constant cheerfulness, and from our always feeling sure of amusement when he was present, his very appearance came at last to put us all on the tip-toe for merriment, so that we were disposed to laugh at any thing; a very wink from Browne's droll eye would have thrown the whole table into a roar; and the colonel, till one unfortunate occurrence, never cared to dine with us if he was not present. I lived with him in a house which we had taken together, near the cantonments of the regiment, and had an opportunity of knowing more of his thoughts than the other officers; so that I soon saw that this natural gaiety was chequered at times by thoughts of no very pleasing kind, and was, indeed, to himself the source of bitter regret, as having led him to the neglect of business, and to much misfortune. He received a number of letters; some from his wife, and others apparently from people of considerable rank; but the latter often lay beside him unopened for days together; and if he did unseal them, it was frequently only for the purpose of clipping them into some odd caricature, to show off a laughable story. I came at last to know his history; for after we had been some time together, his gentle manlike manners gained my sincere respect; and he, on the other hand, was pleased to find a person who took an interest in his feelings, apart from the mere selfish wish for amusement. There were some letters which arrived after his death, and were thrown in here in my absence; you will find them in the bundle in your hand."

I untied the covering of China paper in which the packet was wrapped, and found three letters, one of them in a female hand, sealed with black; another was directed in that kind of careless scratchy writing which is generated by indolence, and sanctioned by fashion, among people who are above business. I held out the letter which was addressed in a lady's hand.

"Open it," said Graham. "I must do so at any rate, in order to write to his friends. That one is from his wife: he doated on her with the greatest idolatry; but his regard was mixed with very bitter reflections, for sufferings of which he blamed himself as the cause.

I began to read—

"Dear Alexander—I received your last letter, as, indeed, they have all come regularly, and the arrangements you have made for sending us remittances have been attended to quite well: we never have the smallest trouble, and Mr Richards is perfectly obliging. I am myself in good health, and have my mind taken up with the most agreeable employment, in forwarding the progress of the children. They are doing well, both in education and in respect to their health, which is greatly owing to the delightful and convenient situation you pitched on for us. The little creatures are always running and romping in the fields, and I go often with them; yet they keep steadily at their tasks, as you will see by the pretty letters which Elizabeth and John have enclosed in this. I encouraged them to write, as it incites them to be diligent, in the hope of pleasing you.

"Some of our old Grosvenor Square friends have called: perhaps I ought to have been pleased to see that they had not forgot us, but I did not encourage any repetition of their visits. They seemed all to think they were doing us some honour in keeping us in remembrance; and as that would have been sufficient to make you neglect them, I thought myself authorised to do the same. Lord Landon called lately too, and appeared, or endeavoured to appear, quite unembarrassed. He even made an offer of his interest at the India House, but I said, as quietly as I could, that I believed your uncle's was sufficient. He asked whether your situation was a permanent one, and I answered, that, at least, you could not be schemed out of it by horse-racers. This clouded his lordship's usual composure, and closed the conversation. I dare say he will not call again soon. He has lately ruined poor Mr Stringer, who lost to him I don't know how much money, besides his whole estate.

"How lucky it is, Alexander, that your education and talents qualified you for this employment! Your uncle writes me that the accounts which are received from India are all in your favour; and he says that the commander-in-chief will assist him in procuring something still better for you, whenever there is an opening. I shall be glad of this, chiefly as it will gratify you, and as it may enable me to join you in India.

"I enclose, as you request, a ringlet of each of the children's hair, and I send one also of poor Jane's, whom you never saw: she was a sweet little girl, but always delicate. I was much affected on receiving your last letter inquiring for her, and asking if she could pronounce your name well; the dear child had just died a month before, as you would see by my letter.

"Adieu, dear Alexander; we are all dependent on you, but I know that you will not consider it a burden. You cannot think with what affection the children repay the kindness of your letters.—I am, &c.

"Jane E. Browne."

I took up next one of the children's letters; it was written in a fair, pains-taking, schoolboy's hand, and contained only a few words.

"Dear Father—We are all well, and I am at school; I am dux in the third class, only when Dick Bellassis traps me down. I know where Calcutta lies from this; it is right away by the south side of Amworth steeple. Master says that the tiger is a species of cat; but I am sure the tiger hunt which you described to us was far better than hunting cats. Dear father, mother and all of us would be happy to see you. Farewell.—I am, &c. John Browne."

The other note consisted of some affectionate expressions from a younger child, and was signed "Euphemia." An enclosure of silver-paper, to which Mrs Browne had alluded, presented a most affecting picture: there were four ringlets of hair sewed on the paper, side by side, with a silk thread; the oldest considerably darker than the others, which were all lighter by degrees, till the delicate flaxen ringlets of the fourth little fair-haired infant who was dead. The name of each was written, by the mother, above the hair; that of the last in a tremulous hesitating hand. It was impossible to look on them without thinking what a bond of deep affection had been broken asunder.

I now took up the second letter: it was very short, and apparently from some acquaintance.

"Dear Browne—I ought to have written you before, but missed the opportunity of Bellew's going out; and then I went to the north for a long time. Things have been going on this season with great spirit; the races were excellent; you would have enjoyed the company and the sport to a degree: it was laughable to see how several large sums changed hands, as if whisked about by a conjuror's rod; I myself gained considerably. Stringer is completely done up; and he owed it to the same old hand whom you blamed for stripping you. I had a narrow escape myself—but still rub on. I hear you are a great favourite with Colonel Bland. The bearer of this (Mr Bloxom) is a young friend of mine whom I would be obliged if you can recommend to his attention: his friends have heard of your interest, and applied to me to write you. I would have called on Mrs Browne, but I believe she thought that I had some concern in the affair of your loss, which I assure you was not the case. That is the misfortune of marrying an heiress; if any thing happens to her money, there is no end to her grumbling.—I am, &c. Augustus Fitzhugh."

There was still another letter, which was written in a large formal hand, apparently from a person in years.

"Dear Alexander—I received your letter, and was glad to see you punctual to your engagement; the draft was duly honoured. You cannot do too much for your wife, for she is one of the most exemplary women I ever saw. She never speaks, nor even seems to think of the loss of her own fortune, which may be partly owing to her not having been bred up to expect it, and having few expensive habits; but it is also owing greatly to her affection for you and her family, whom she rears up with the greatest reverence for you; and I hope you will justify the opinions which she instils into them concerning their father.

"If you give way to the rash imprudent disposition for which I have so often blamed you, or enter again into habits of company-keeping, you will do an injury to this amiable family which no one can repair. I am glad to hear that nothing of the kind has yet happened: it is only a continuance of the same prudence which can enable me to serve you in India. I have Colonel Bland's last letter, who hopes to see you appointed soon to some lucrative situation, where Mrs Browne may indulge her wish of joining you.—I am, &c.

"Robert Barclay."

"And what happened to Mr Browne?" I inquired.

"The circumstances have hardly been spoken of openly, from various considerations which it would be disagreeable to explain; but they were melancholy enough. Browne, as I told you before, had come out to form the rocket brigade, which was a new thing here, and for which he was really well qualified. Every thing proceeded well for some years, and he was as much respected in his profession as he was liked in private life; for though he had a great deal of humour, there was no satire or ill nature in his composition, and he made few enemies. In our last campaign, however, the general, I was told, gave way to some pettish expressions of chagrin at the quantity of stores marked down as expended in Browne's department; and Browne, to whom the thing had been mentioned in some irritating way, replied, that the commissary's clerks must have falsified the accounts, and urged to see the vouchers he had given in. I don't know how the mistake might have been cleared up; but one day, when a number of officers were looking at the tricks of an Indian juggler, who pretended to take four balls out of a bag into which two only had been deposited, the man's dexterity was generally applauded, and Browne said, with a smile, 'Oh, that fellow must have been educated in the commissary's office.' A nephew of Colonel Wright, the commissary, was present, who seemed to resent the allusion to his uncle, and some farther words passed between Browne and him. Nothing, however, fell under my own observation, though I judged that the affair could not terminate pleasantly.

"Our cantonments were placed on an eminence which overlooked a large and beautiful meadow, not far from the river Nerbuddah. In the mornings this flat ground was generally covered over with a sheet of mist of the most milky whiteness, but so shallow that it scarcely rose above the height of a man; and we could see from the high grounds the tops of the little Indian cottages, the upper parts of high bushes, and the trunks and tops of some scattered palms, quite distinctly over the vapour, which lay as flat as a lake. I recollect its appearance on the morning when this circumstance happened, as if I saw it now before me. I had gone out to take a ride along the high ground, and was admiring the singular density and whiteness of the mist, when I saw two persons riding swiftly in the flat below. The head and shoulders of the riders were visible above the sheet of vapour, but the rest was concealed. They halted shortly after, dismounting immediately; and I thought I saw others arrive in the same retired spot of the plain to which they had gone. My mind was still occupied with what had occurred about Browne, and, suspecting that some unhappy affair was going to take place in which he was concerned, I pushed my horse directly for the place I have mentioned. Having once descended among the mist, however, where I could only see five or six yards before me, farther progress became difficult, and I was considerably at a loss how to keep the right direction. I had not been five minutes on my way when I heard two pistol shots fired, which intimated that I was in all probability too late; but, being set right as to the quarter they came from, I urged forward, groping through the vapour, and stumbling more than once over the low fences used in the wet season for confining water

on these plains in order to irrigate the rice. I at last heard voices, one of which I was sure spoke in English. I hurried up to the spot, and saw my worst fears confirmed. An officer, whom I instantly recognised to be Browne, was lying on his side, while a person in a military greatcoat was stooping over him. There were three or four wild-looking natives standing by, apparently just roused from their beds, and wrapped in the cloths in which they had been sleeping. When I mixed with this melancholy group, Browne knew me immediately. 'My dear Graham,' he said, 'is it you? This has been an unfortunate affair. I am dying—I feel it.' Seeing him exhausted, I said, 'I hope not. Is Mr Shepherd (the regimental surgeon) here?' 'He will be here directly,' said the other officer, whom I now recognised to be Captain Spalding, a cousin of Browne's wife, and his second on this occasion, as I supposed. 'It is all right,' said Browne; 'but he can do nothing. My God! that it should end this way! Poor Jane—poor Jane—how will she bear it all?—how will they?—oh God!' He was silent for a little, and I made some inquiries concerning his wound at Spalding, who only shook his head. Browne again spoke. 'Spalding, you will forward the letters, and do as I bade you. The mist is becoming very thick indeed: dark—dark! Ay, her heart has been broken twice—Ah!'

"We perceived that he was dying, and from the nature of the wound which I now saw in his left breast, it was impossible that he could survive more than a few minutes. The words which he spoke were unconnected, and apparently without consciousness, and after a moment we could hardly distinguish whether he still breathed.

"At this time a singular circumstance occurred. The little goat which you saw—she is there still—had been a great favourite with Mr Browne, and used to run scampering about him, eating fruit or bread from his hand whenever he returned to his lodgings. At the time when we were standing beside him, as I have described, she came running up, and, without regarding us, made directly for Browne, going close to him, and putting her mouth into his hand. She did not, however, stop a moment, but went smelling along till she came to the wound, where there was blood on his breast, when she raised her head a very little, and gave a short dismal bleat, as if in terror. She then turned about, and ran away to the tent, where she was found cowering on our return."

"Was any notice taken of the circumstances of Mr Browne's fate?"

"These occurrences are so rare here, and the consequences so utterly ruinous to all concerned, that there was some reluctance to take it up formally; but Sommerville, Browne's opponent, belonged to a king's regiment, and got transferred from India, with very little comfort. No one thought there was any occasion for urging the matter in the way he did, and Browne's conduct, allowing for a little irritation, which could not be wondered at, was perfectly correct and gentlemanlike."

Such is another melancholy instance of the effects of the abominable practice of duelling.

THE APOCRYPHA.

SECOND ARTICLE.

We now come to the Seventh Book of the Apocrypha, entitled "The Wisdom of Jesus the Son of Sirach, or Ecclesiasticus," which like the preceding has sometimes been considered as the production of king Solomon; whence the Council of Carthage deemed it canonical, under the title of the Fifth Book of Solomon, and their decision was adopted by the Council of Trent. It is, however, manifest that it was not, and could not be, written by Solomon, because in it allusion is made to the captivity; although it is not improbable that the author collected some scattered sentiments ascribed to Solomon, which he arranged with the other materials he had selected for his work. Sonntag is of opinion that this book is a collection of fragments, or miscellaneous hints for a large work, planned out and begun, but not completed. From the book itself it appears that it was written by a person of the name of Jesus the Son of Sirach, who had travelled in pursuit of knowledge. By reading the Scriptures, and other good books, he attained a considerable share of wisdom; and by collecting the grave and short sentences of such as went before him, and adding sundry of his own, he endeavoured to produce a work of instruction that might be useful to his countrymen.

This book was originally written in Hebrew, or rather the Syro-Chaldaic dialect then in use in Judea, about the year 232 before Christ, when the author was probably about seventy years of age. Jesus, his grandson, who is also called *The Son of Sirach*, translated it into Greek during the reign of Ptolemy Evergetes, king of Egypt, about 140 years before Christ, for the use of the Hellenistical Jews, amongst whom he had settled in Alexandria. The Hebrew original is now lost; but it was extant in the time of Jerome, for he tells us that he had seen it under the title of *The Parables*; but he says that the common name of it in Greek was *The Wisdom of Jesus the Son of Sirach*. The Latin version of this book has more in it than the Greek, several particulars being inserted which are not in the other. These seem to have been interpolated by the first author of that version; but now the Hebrew being lost, the Greek, which has been made from it by the grandson of the author, must stand for the original, and from that the English translation has been made. From the supposed resemblance of this book to that of *Ecclesiastes*, it has received from the Latin translator the title of *Ecclesiasticus*, by which name it is most generally known and referred to.

Ecclesiasticus is considered by far the best of all the apocryphal books. The ancients called it *Panareton*, that is, *The Treasury of Virtue*, as supposing it to contain maxims leading to every virtue. It has met with general esteem, also, in most of the Western churches, and was introduced into the public service of the Church of England by the compilers of its Liturgy. It was frequently cited by the fathers of the church under the titles of *The Wisdom of Jesus, Wisdom, The Treasure of all the Virtues*, or *Logos, the Discourse*; and in those times it was put into the hands of catechumens, or young Christians under examination, on account of the edifying nature of its instruction.

The book commences with an exhortation to the pursuit of wisdom; this is followed by numerous moral sentences or maxims, arranged somewhat after the manner of the Proverbs of Solomon, as far as the forty-fourth chapter, at which the author enters upon a eulogy of the patriarchs, prophets, and celebrated men among the Jews, to the end of the fiftieth chapter: and the book concludes with a prayer. The author makes honouring of parents and giving of alms to be an atonement for sin; affirms that some men are in this world possessed of *sinless perfection*; with many other things entirely inconsistent with the doctrines of inspired Scripture; and, indeed, this author begs pardon if there should be any thing in the book amiss, which shows plainly that he was not inspired.

VIII. The Book of "Baruch" is not extant in Hebrew, and only in Greek and Syriac; but in what language it was originally written, it is now impossible to ascertain. Grotius is of opinion that it is an entire fiction, and that it was composed by some Hellenistical Jew, under the name of Baruch. The principal subject of the book is an epistle, pretended to be sent by Jehoiakim and the captive Jews in Babylon, to their brethren in Judah and Jerusalem: and the last chapter contains an epistle which falsely bears the name of Jeremiah. This has never been considered as a canonical book, either by the Jews or the Christians; and, indeed, it is little else than an arrant romance. It absurdly pretends to have been written by Baruch at Babylon, when it is probable he never went thither: that it was read to Jechoniah at the river Sud, which is no where else mentioned; nor could Jechoniah hear it there, when he was confined in prison. It mentions a collection to buy sacrifices, gathered by the captives in Babylon, and sent to Joakim the priest, along with the sacred vessels which Zedekiah had made; but, how could the captives, newly enslaved in Babylon, be able to make collections? How could they send it to a high priest that did not then exist? How could the sacred vessels which Zedekiah made, be returned from Babylon, when it does not appear that he made any? Or how could they be returned before they were carried away, along with himself? The author borrows a variety of expressions from Daniel, and must, therefore, have lived after Baruch was dead. The epistle ascribed to Jeremiah is neither written in his style, nor at all in the style of the Scriptures; and it ridiculously turns the *seventy years* of the captivity into *seven generations*.*

IX. "The Song of the Three Children in the Furnace" is placed in the Greek version of Daniel, and also in the Vulgate Latin version, between the twenty-third and twenty-fourth verses of the third chapter. It is partly a poor imitation of the 148th Psalm, and partly deprecatory, not at all suited to such a deliverance. It does not appear to have ever been extant in Hebrew; and although it has met with a good deal of approbation for the piety of its sentiments, it was never admitted to be canonical, until it was recognised by the Council of Trent. The account of the flame streaming above the furnace "forty-and-nine cubits," and of the angel's "smiting the flame out of the oven, and making a moist whistling wind in it," seems entirely fabulous and romantic; nor is it very consistent with the account of the fire's loosening their bands. The fifteenth verse contains a direct falsehood; for it asserts that there was no prophet at that time, when it is well known that Daniel and Ezekiel both exercised the prophetic ministry then in Babylon. This apocryphal fragment is, therefore, most probably the production of some Hellenistic Jew. The Hymn resembling the hundred and forty-eighth Psalm, which commences at the 29th verse, was so approved of by the compilers of the Liturgy of the Church of England, that they appointed it to be used instead of the *Te Deum* during Lent.

X. "The History of Susanna" has always been treated with some respect, but has never been considered as canonical, though the Council of Trent admitted it into the number of the sacred books. It is evidently, like the rest, the work of some Hellenistic Jew, and in the Vulgate version it forms the thirteenth chapter of the Book of Daniel. In the Septuagint version, it is placed at the beginning of that book. Lamy, and some other modern critics, after Julius Africanus, and Origen, consider it to be both spurious and fabulous. That it was originally written in Greek, is manifest, in the punishment pronounced on the elders, from the play which is made upon the Greek names of the mastic and holm trees, under which, they said, they found Susanna and the young man together. It is evidently absurd to affirm, that, in the beginning of the captivity, Joachim, the husband of Susanna, was become exceedingly rich: that there were Jewish judges with the power of life and death in Chaldea: that Daniel, who was bred in the court, had leisure, or, being so young, was admitted to be a judge: that Susanna went into her garden to wash at noon-day, and did it without searching if any body was there: or that the elders attempted to force her, when they could not but every moment expect the return of her maids.

XI. "The History of the Destruction of Bel and the Dragon" is a still more romantic story. It is not extant in either the Hebrew or the Chaldee language, and it was always rejected by the Jewish church. Jerome gives it no better title than that of *The Fable of Bel and the Dragon*; nor has it obtained more credit with posterity, except with the fathers of the Council of Trent, who determined it to be a part of the canonical scriptures. It forms the fourteenth chapter of Daniel in the Latin Vulgate; in the Greek it was called the Prophecy of Habakkuk, the son of Jesus, of the tribe of Levi: but this is evidently false, for that prophet lived before the time of Nebuchadnezzar, and the events pretended to have taken place in this fable are assigned to the time of Cyrus. There are two Greek texts of this fragment, that of the Septuagint, and that found in Theodotion's Greek version of Daniel.

The design of this fiction is to render idolatry ridiculous, and to exalt the true God; but the author has destroyed the illusion of his fiction, by transporting to Babylon the worship of animals, which was never practised in that country. It is, also, quite improbable, that Cyrus, a Persian, would worship a Babylonian idol; nay, an idol that was broken to pieces at the taking of the city! It is absurd to imagine that a man of his sense could believe an image of brass and clay did really eat and drink. How pitiful, for Daniel, to discover the coming of the priests to devour the provisions, by making the king's servants strew ashes on the floor, when the priest might so easily perceive them, or the servants so readily inform concerning them! It is absurd to suppose that the newly-conquered Babylonians should, by menaces, oblige Cyrus to deliver up his beloved Daniel to them, to be cast into the den of lions; or, that Habakkuk should be then alive to bring him food; or, that Cyrus should be seven days before he went to the den, to see what was become of his favourite minion.

XII. "The Prayer of Manasses, king of Judah, when he was holden captive in Babylon," never appeared in the Hebrew language, and seems to be the product of some Pharisaical spirit. It was never recognised as canonical, and is rejected as spurious even by the Church of Rome. It cannot be traced to a higher source than the Vulgate Latin version; and, therefore, it has no claim to be considered as the original Prayer which, in the Book of Chronicles, Manasseh is mentioned to have made, and which it pretends to be. The author speaks of just persons, such as Abraham, Isaac, and Jacob, as being *without sin*, and *not called to repent*.

XIII. The Books of the "Maccabees" are thus denominated, because they relate the patriotic and gallant exploits of Judas Maccabeus and his brethren. The Maccabees arose in defence of their brethren the Jews, during the dreadful persecution to which they were subjected, on account of their religion, under Antiochus Epiphanes, king of Syria, about 160 years before Christ. The most likely derivation of the title Maccabees, is that which takes it from the motto put by Judas in his standard, being this Hebrew sentence, taken out of Exodus xvi. 11, *Mi Camo-ka Baelim Jehovah, i. e.* "Who is like unto thee among the gods, O Jehovah?" which being written, like the S.P.Q.R., *Senatus Populusque Romanus*, on the Roman standards, by an abbreviation formed by the initial letters of these words put together, made the artificial word *Maccabi*; and hence all who fought under that standard were called Maccabees or Maccabeans.

The First Book of Maccabees is a very valuable historical monument, written with great accuracy and fidelity, on which even more reliance may be placed than on the writings of Josephus, who has borrowed some of his materials from it, and has frequently mistaken its meaning. It is, indeed, an excellent history, and comes the nearest to the style and manner of the sacred historical writings of any extant. It was written originally in the Chaldee language of the Jerusalem dialect, which was the language spoken in Judea, from the return of the Jews thither from the Babylonish captivity; and it was extant in this Syro-Chaldaic language in the time of Jerome, for he tells us that he had seen it. The title which it then bore was, *The Sceptre of the Prince of the Sons of God*; a title which is certainly suitable to the character of Judas, who was a valiant commander of the persecuted Israelites. It contains the history of the Jews, under

* Brown's Dictionary of the Bible. Art. *Apocrypha*.

the government of the priest Mattathias and his sons, from the beginning of the reign of Antiochus Epiphanes to the death of Simon Maccabeus, a period of about thirty-four years. The author of this book is not certainly known: some conjecture that it was written by John Hyrcanus, the son of Simon, who was prince and high priest of the Jews for nearly thirty years, and who commenced his government at the time when this history ends: by others it is ascribed to one of the Maccabees, and many are of opinion that it was compiled by the men of the great synagogue. It is, however, most probable, that it was composed in the time of John Hyrcanus, when the wars of the Maccabees were terminated, either by Hyrcanus himself, or by some persons employed by him. There is both a Greek and a Latin translation of it, from the Syro-Chaldaic; and our English version is made from the Greek.

There are many things in this book which show that it was not written by inspiration. The writer often observes, that *there was no prophet* in his times: and, indeed, he has blundered into several mistakes; as, that Alexander the Great parted his kingdom among his honourable servants while he was yet alive; that Antiochus the Great was taken alive by the Romans; that they gave India and Media, parts of his kingdom, to Eumenes, king of Pergamus; that the Roman senate consisted of 320 persons; that Alexander Balas was the son of Antiochus Epiphanes, and several others which are palpably absurd.

XIV. The "Second Book of Maccabees" is a history of fifteen years, from the execution of the commission of Heliodorus, who was sent by Seleucus to bring away the treasures of the temple, to the victory obtained by Judas Maccabeus over Nicanor, that is, from the year of the world 3828 to 3843. It commences with two epistles sent from the Jews of Jerusalem to those of Alexandria and throughout Egypt, exhorting them to observe the feast of the dedication of the new altar, erected by Judas Maccabeus on his purifying the temple. The second of these epistles is not only written in the name of Judas Maccabeus, who was slain thirty-six years before, but also contains such fabulous and absurd stuff, as could never have been written by the great council of the Jews assembled at Jerusalem for the whole nation, as this pretends to be. The epistles, which are confessedly spurious, are followed by the author's preface to his history, which is an abridgement of a larger work, compiled by one Jason, a Hellenistic Jew of Cyrene, who wrote in Greek the history of Judas Maccabeus and his brethren, and an account of the wars against Antiochus Epiphanes, and his son Eupator, in five books. The entire work of Jason has long since perished; and Dr Prideaux is of opinion that the author of this second book of Maccabees was a Hellenistic Jew of Alexandria, because he makes a distinction between the temple in Egypt and that at Jerusalem, calling the latter "*the Great Temple.*"

The compilation of this unknown author is by no means equal in accuracy to the First Book of the Maccabees, which it contradicts in several instances; it is not arranged in chronological order, and sometimes also it is at variance with the inspired writings. The author concludes it, begging excuse if he had said any thing unbecoming the story; and, indeed, he had reason to do so, considering what a number of false and wicked things he retails; as, that Judas Maccabeus was alive in the 188th year of the Seleucidæ, when he died in the 152d; that Antiochus Epiphanes was killed at the temple of Nanea in Persia, whereas he died on the frontiers of Babylon, of a terrible disease; that Nehemiah built the second temple and altar, whereas they were built sixty years before he came from Persia; that Jeremiah hid the tabernacle, ark, and altar of incense in a cave; that Persepolis was in being 100 years after Alexander had burnt it to ashes; that Judas did well in offering prayers and sacrifices to make reconciliation for the dead; and that Rasis did well in murdering himself to escape the fury of the Syrians.

The name of Maccabees was first given to Judas, the son of Mattathias, the priest of Modin, and his brethren, for the reason which has been already mentioned; and, therefore, the two books just spoken of, which give us an account of their actions, are called the First and the Second Book of the Maccabees. But because they were sufferers in the cause of their religion, others who were like sufferers in the same cause, and by their sufferings bore witness to the truth, were in after times called also *Maccabees* by the Jews. For this reason, other two books, giving an account of other persecutions endured by the Jews, are found under the title of the *Third* and *Fourth* Books of the Maccabees. The Third Book contains the history of a persecution intended against the Jews in Egypt by Ptolemy Philopater, but which was miraculously prevented. From its style, this book appears to have been written by some Alexandrian Jew; it abounds with the most absurd fables. With regard to its subject, it ought in strictness to be called the First Book of Maccabees, as the events it professes to relate occurred before the achievements of that heroic family; but as it is of less authority and repute than the other two, it is reckoned after them. It is found in most ancient manuscripts of the Greek Septuagint, particularly in the Alexandrian and Vatican manuscripts; but it was never inserted in the Latin Vulgate, nor in our English Bibles.

Of the *Fourth* Book of the Maccabees very little is known. It is destitute of every internal mark of credibility, and is supposed to be the same as the book "concerning the government, or empire of reason," ascribed to Josephus by Philostratus, Eusebius, and Jerome. It is extant in some Greek manuscripts, in which it is placed after the three books of Maccabees. Dr Lardner thinks it is the work of some unknown Christian writer. The history contained in it extends to about 160 years; beginning at Seleucus's attempt to pillage the temple, and ending just before the birth of Jesus Christ.

Upon the whole, in regard to these apocryphal books, it is to be observed, they appear to have been entirely the work of Hellenistic Jews, and quite destitute of any proper claim to the authority of inspiration. The Jews, after their return from the Babylonish captivity to the time of our Saviour, were much given to religious romances; and of this sort the greater part, if not all, of these books, are to be accounted. They were never extant in Hebrew, neither are they quoted in the New Testament, or by the Jewish writers, Philo and Josephus; on the contrary, they contain many things which are fabulous, false, and contradictory to the canonical Scriptures. They are nevertheless possessed of some value as ancient writings, which throw considerable light upon the phraseology of Scripture, and upon the history and manners of the East.

TOOTHACH.

"When fevers burn and agues freeze us,
Rheumatics gnaw and cholics squeeze us,
Our neebors sympathise to ease us,
Wi' pitying moan—
But thou the hell o' a' diseases,
They mock our groan." BURNS.

THE toothach is rendered more distressing, if not more acute, by there being no commiseration for the wretchedness it occasions. The belief in this, and a keen recollection of bodily and mental sufferings, have produced the following little narrative:—

Some years ago, a tremendous tooth, with three enormous prongs, confined me to my room, and irritated me to a state little short of distraction. With my head tied up in a bandana handkerchief, both hands on my afflicted jaw, I sat swaying my body to and fro, as if endeavouring to calm a fractious infant; at other times I stamped about like a lunatic, or plunged on my bed like a frog swimming. Being at length reduced to a state of exhaustion, I was anxious to retreat from all intercourse with the world; yet knock after knock at the door continued, as if only to increase my already excessive nervous irritability. Many of the persons I had no desire to see, but some were those interwoven with my professional pursuits, and I was compelled to be at home. I had to account for my disconsolate appearance—to describe my tormenting pangs, till I was weary of speaking upon the subject. To all of my fervid descriptions, I received the cold remark, and the chilling advice, that it was *only* the toothach, and that I had better have it *extracted.* All this time, the salivary glands were pouring their fluids into my mouth, the gastric juices were wasting their powers, and I was in a paroxysm of excruciating anguish. It was astonishing how persons could calmly behold such a complication of miseries. Nothing could be eaten; slops became offensive; the sight of a spoon frightful; and a basin revolting as a perpetual blister. Even the air could not be taken!—it was too much for the petulance of my capricious tooth. On it raged, as if torments were its delight. In all my reading, I never met with any author but Burns who had a proper idea of the toothach. He wished his enemies to have it for a twelvemonth. Oh dear! He must be more or less than man who could endure this. He must despair and perish.

How true it is, that out of evil often some good will spring; for while I was enduring this thumb-screw on my gums—this gout in my jaw—this rack of nerves—this destroyer of brains—amid this desolation I acquired much useful information respecting the toothach. One friend informed me that half the suffering was occasioned by nervous irritability; for, if I went to a dentist with a determination to have the tooth extracted, the moment I entered the door the tooth would cease to give me pain. He had proved it more than once.

Another friend smiled at my deplorable situation, and laughed at my desire to retain in my mouth such a *thing*, that had ceased to be a tooth; it was a mere stump, with a carious triplex fang; worse than useless; it was positively injurious. If the case were his, he should give such a tenant immediate notice to quit. With a pair of pincers he would serve the ejectment himself, as an empty house was preferable to a bad tenant.

Another friend requested me to be careful in selecting an operator on my tooth, for that he went to a dentist once, under anguish scarcely endurable, to have a large double tooth like mine extracted. He seated himself in a chair, and was told to hold fast by the frame-work of the seat, to prevent being hoisted up by the lever-power in the hands of the operator. All was properly arranged, the instrument in, and a tooth drawn; but, unfortunately, the fellow had taken the wrong tooth out, being the only one left to meet another in the opposite jaw, to enable my friend to masticate his food. Bad as this was, he found it must be endured, because the tooth could not be replaced, and because a portion of the jawbone had been torn away with the tooth. Miserable situation! The pain redoubled its violence, and he resolved to have the tormenting fang extracted. To prevent being tossed against the ceiling, he fixed his feet in leather straps attached to the floor, and held firmly by the chair. In this determined state he made a round O of his mouth; the operator popped in the instrument, and u-g-h!—a-h!—it slipped. He felt as if a loaded waggon had passed over his head. The dentist apologised, saying, "It was a common occurrence; gentlemen did not mind it much, because the next attempt was always successful." This my friend was obliged to receive as a consolation, though deficient in every satisfactory particular. Down he sat; made another round O; in went the instrument. Oh!—ough!—gh! His head seemed separated from his body, but only part of the tooth with one fang was extracted. Again the dentist begged pardon; "hoped he should be excused, as every one must have a beginning, in whatever profession. He would fetch his master, who would punch out the remaining fangs in less than a quarter of an hour!" This was too much. The gentleman sickened at the idea, and left the shop in a worse state than when he entered, resolving never to intrust his head in the hands of a beginner again.

This was a frightful relation of accumulated horrors to me, for, as I had no expectation of relief from agony, but by the skill of a dentist, I shuddered lest I should be subjected to similar treatment. My poor servant-girl Betty, who heard the description of this bungling operation, screamed in sympathetic recollection of what she once had suffered under the hands of a dentist. She begged of me, "for goodness sake, to give up the notion of going to have my tooth hauled out in that fashion, for she could assure me it was quite unspeakable for to tell the pain that must be endured. It was the most horrid *scrawnch* that ever was in this mortal world. Nobody could tell if their head was off or no, and it wa'nt a right way for to treat any human Christian." I listened to poor Betty, because I began to think there was one person who could appreciate my sufferings. I hoped to escape from farther interruption by being denied, but Betty told me a gentleman had been waiting some time in the parlour, who said he would not detain me half a minute. He came—a friend I had not seen for years. He sympathised with me, while I briefly told how sadly I was afflicted.

"My dear friend," exclaimed he, "I can cure you in ten minutes."

"How? How?" inquired I; "do it in pity."

"Instantly," said he. "Betty, have you any alum?"

"Yes."

"Bring it, and some common salt."

They were produced; my friend pulverized them, mixed them in equal quantities; then wet a small piece of cotton, causing the mixed powders to adhere, and placed it in my hollow tooth.

"There," said he; "if that do not cure you, I will forfeit my head. You may tell this in Gath, and publish it in the streets of Aschalon; the remedy is infallible."

It was as he predicted. On the introduction of the mixed alum and salt, I experienced a sensation of coldness, which gradually subsided, and with it the torment of the toothach.

Though I thus learnt something from my sufferings, and entertain a hope that what I learnt, being thus published, will be of service to my fellow-creatures, I am far from believing that any catholicon or universal remedy has yet been discovered for this afflicting malady. It would almost appear, indeed, that, instead of there being any general cure for the toothach, every body would require to have his own cure; for though certain preparations have been found effectual in certain cases, nothing is so common as to find these fail when applied to others. Probably there is one particular cure for every man on earth, if he only could discover what it is. Till that be done, I am afraid that the disease must be looked upon as a *pin loose in nature*, and just endured, when a remedy cannot be hit upon, as an unavoidable evil.

GARDENS IN SHIPS.

To sow in the temperate zone, and reap between the tropics, is a somewhat singular thing. Yet it is constantly done; for our great East India ships, in imitation of the Dutch, who first introduced the practice, have small salad gardens in flat wooden boxes on their poops, where the seed, acted upon by a heat increasing daily, shoots up in a surprisingly rapid manner. In these gardens the number of crops in a year are more numerous than in any spot on earth, for the gardeners, if so minded, can command almost any temperature.

NATURAL HISTORY.

THE SKUNK.

THE length of the skunk, from the nose to the tail, is about eighteen inches, and the tail itself measures fourteen inches. Its nose is long and slender, protruding a considerable way beyond the lower jaw; its ears are large, short, and rounded; a white stripe extends from the nose over the forehead and along the back, where it is intersected by a small line of black, commencing at the tail, directed upwards along the middle of the back; its sides, belly, and legs, are black; its hair long and flowing, particularly on the tail, which is thick, bushy, and very long.

The native country of the skunk is principally Peru, Brazil, and other parts of South America, although it is found as far north as Canada. This animal is remarkable on account of the intolerable and almost suffocating fetor, of a vapour that it emits, especially when pursued or irritated. This odour may be smelt at a great distance, and so abominable and powerful are its effects, that provisions once tainted with it are irrecoverable. Clothes, after having been exposed to this noxious vapour, have been washed and soaked for days in water, dried in the sun, and still retained this fetid smell for many months.

We are told by Professor Kalm that a skunk was once perceived by a servant in a cellar, which she attacked and killed, without thinking of the effluvia. The place was instantly filled with a horrid stench, which so affected the thoughtless woman, that she was taken seriously ill, in which state she continued for some considerable time.

Few dogs will attack the skunk, on account of this fetor, which seems the animal's best defence against its enemies. Cattle that come within the influence of this vapour are so disgusted and alarmed, that they set up a horrid bellowing.

The skunk is sometimes domesticated, and, strange as it may appear, it is never known to emit this fetid vapour in a tame state. It is naturally a bold animal, and does not hesitate to enter farm establishments, and even houses, in search of eggs and other food.

THE OTTER.

The body of the otter is about two feet long, and the tail sixteen inches; the legs are short and robust; on each foot are five toes, which are webbed, and furnished with strong sharp nails; the eyes are large, brilliant, and so placed in the head, that the animal can see any object that is above it, which adds to the singularity of its aspect. Its fur is deep blackish brown, with two small light spots on each side of the nose, and another under the chin.

The otter is a native of Britain, the whole Continent of Europe, and America. It fixes its habitation on the banks of rivers, where it burrows to some depth—its principal food being fish. It is semi-amphibious, living almost constantly in the water. The burrow is constructed with great sagacity—its entrance being invariably under water, inclining upwards to the surface of the earth; and, before reaching the top, it constructs several lodges, at different heights, to which it may retire in the event of floods, of which it must have an instinctive forethought; for although so much accustomed to a watery element, no animal is more particular in lying quite dry. At the top of the uppermost of these cells, it opens a very small orifice for the admission of air; and the more effectually to conceal this opening, it is generally placed in the middle of a thick bush of willows or other shrubs.

In Canada, during winter, otters frequently travel to a considerable distance from trees, but for what purpose they make these excursions, it has not been satisfactorily ascertained. In these cases the Indians track them in the snow, and kill them with clubs, which they carry. The otter is a slow-paced animal, and, if closely pursued, before being overtaken, when the snow happens to be light and deep, they immediately dive a considerable way under it; but this seldom avails them, for their crafty pursuers can easily trace them by their motions in passing through the snow.

The otter is naturally of a ferocious disposition, but, nevertheless, when taken young, and properly treated, it can easily be rendered quite tame, and may be taught to catch fish and fetch them to its master.

In the following passage of the *Prædium Rusticum* of Vaniere, allusion is made to tame otters being employed in fishing:—

> "Should chance within this dark recess betray
> The tender young, bear quick the prize away.
> Tamed by thy care, the useful brood shall join
> The wat'ry chase, and add their toils to thine;
> From each close-lurking hole shall force away,
> And drive within their nets the silver prey:
> As the taught hound the timid stag subdues,
> And o'er the dewy plain the panting hare pursues."

Hunting the otter was a favourite British pastime. It has now, however, fallen greatly into disuse. A few otter-hounds are still to be found in various parts of Britain. The Duke of Buccleuch possesses a few couples of them. During the reign of Elizabeth, large packs were kept, this being a favourite diversion of the young nobles. In Sommerville's Chase he makes the following allusion to the otter, and moralizes on its destructive properties:—

> "Where rages not oppression? Where, alas!
> Is innocence secure? Rapine and spoil
> Haunt even the lowest deeps; seas have their sharks,
> Rivers and ponds enclose the rav'nous pike;
> He in his turn becomes a prey; on him
> Th' amphibious otter feasts. Just is his fate
> Deserved; but tyrants know no bounds: nor spear.
> That bristle on his back, defend the perch
> From his wide greedy jaws; nor burnish'd mail
> The yellow carp; nor all his arts can save
> Th' insinuating eel, that hides his head
> Beneath the slimy mud; nor yet escapes
> The crimson-spotted trout, the river's pride,
> And beauty of the stream. Without remorse,
> This midnight pillager, raging around,
> Insatiate swallows all. The owner mourns
> Th' unpeopled rivulet, and gladly hears
> The huntsman's early call."

The otter defends itself with determined courage, never yielding till the last extremity, and is seldom killed without inflicting severe wounds on its antagonist. When roused, and in a state of desperation, he not unfrequently becomes the assailant, and, fixing on an adversary like a bull-dog, maintains his hold as long as life remains.

When the otter has caught a fish, he carries it to the banks of the river, where he eats the head and upper parts of the body, leaving the rest untouched; so that a considerable quantity of food is required to satisfy its hunger. He generally pursues his prey from the bottom upwards, and takes it by surprise; for which the manner his eyes are situated peculiarly fits him.

The female brings forth, in the spring, from four to five at a birth. Their affection for their offspring is so powerful, that they will frequently suffer themselves to be killed rather than quit their progeny; and this is often the occasion of them losing their lives when they might otherwise have escaped.

Professor Steller says that they are very tender mothers. "Often have I spared the lives of the female otters whose young ones I took away. They expressed their sorrow by crying like human beings, and followed me as I was carrying off their young, while they called to them for aid with a tone of voice which very much resembled the crying of children. When I sat down in the snow, they came quite close to me, and attempted to carry off their young.

"On one occasion, when I had deprived an otter of her progeny, I returned to the place eight days after, and found the female sitting by the river listless and desponding, who suffered me to kill her on the spot without making any attempt to escape. On skinning her, I found she was quite wasted away from sorrow for the loss of her young.

"Another time, I saw at some distance from me an old female otter sleeping by the side of a young one about a year old. As soon as the mother perceived us, she awoke the young one, and enticed him to betake himself to the river; but as he did not take the hint, and seemed inclined to prolong his sleep, she took him up in her fore-paws, and plunged him into the water."

The flesh of the otter has been eaten, but it is of a rank and fishy taste, on which account, probably, the Roman Catholic church permitted it to be used on maigre days. Pennant says, that, when on his travels, he saw, in a convent near Dijone, in France, an otter cooked for the monks of the Carthusian order, who are said to have been rigidly strict on all points of their faith, which enjoined their perpetual abstinence from the use of animal food.

James Campbell, near Inverness, procured a young otter, which he brought up and tamed. It would follow him wherever he chose, and, if called on by its name, would immediately obey. When apprehensive of danger from dogs, it sought the protection of its master, and would endeavour to spring into his arms for greater security. It was frequently employed in catching fish, and would sometimes take eight or ten salmon in a day. If not prevented, it always made an attempt to break the fish behind the anal fin, which is next the tail; and as soon as one was taken away, it always dived in pursuit of more. It was equally dexterous at the sea-fishing, and took great numbers of young cod and other fish there. When tired, it would refuse to fish any longer, and was then rewarded with as much as it could devour. Having satisfied its appetite, it always coiled itself round and fell asleep, in which state it was generally carried home.

Otters can be easily tamed, and instructed to fish. A person who kept a tame otter accustomed it to associate with his dogs, who soon became upon the most friendly terms. It would accompany him in different excursions, along with his canine attendants. He was in the habit of fishing in rivers with nets, on which occasions the otter proved a highly useful assistant, by going into the water, and driving trout and other fish towards the net. It was not a little remarkable, that even dogs accustomed to otter-hunting were so far from offering it the least molestation, that they refused to hunt any other otter while he remained in their company, on which account the owner was under the necessity of parting with it, although so useful in his avocations.

William Collins, who resided at Kilmerston, near Wooler, in Northumberland, had a tame otter which followed him wherever he went. He frequently took it to fish in the river for its own food, and it never failed to return to its master. One day, in the absence of Collins, the otter being taken out to fish by his son, instead of returning as usual, refused to come at the accustomed call, and was lost. Collins tried every means to recover it, and, after several days' search, being near the place where it was lost by his son, and calling it by name, it came creeping to his feet, exhibiting many unabated marks of affection and attachment.

THE SEA OTTER.

The fur of the sea otter is thick and long, and of a beautiful shining black colour, but it is sometimes, though rarely, of a silvery hue; the legs are thick and short; the toes joined by a web; the hind feet are like those of a seal. The total length from the nose to the tail is four feet two inches; the tail is flat, thirteen inches long, and pointed at the extremity. The largest sized animals of this species weigh about eighty pounds.

The sea otter is a remarkably harmless animal, and most affectionately fond of its young; they have been known to pine to death for the loss of their offspring, and even to die on the spot from whence they have been taken away. Before the young can swim, the old animals carry them in their paws, and support them in the water lying upon their backs.

The sea otter can swim in various positions—on its back, sides, and even perpendicularly, and are excessively sportive in the water. It frequents shallow pools which abound in sea-weeds, and feeds on crabs, lobsters, and other marine animals. They breed but once a-year, and only produce but one at a time, which the female suckles and attends with great assiduity for nearly a year.

Vast numbers of these animals inhabit the coasts of Kamschatka, and the numerous islands contiguous to it, as well as the opposite coasts of America; they are also found on the larger South American islands. Their skins are of great value, and have long formed a considerable article of export from Russia. They dispose of them to the Chinese at the rate of seventy or a hundred rubles each, and receive in return some of their most valuable commodities.

WANTS A PLACE,

> A faithful creature, trained to serving,
> And certified as well deserving;
> No object wages will be thought,
> A friendly mistress more is sought—
> A house where things go on in quiet,
> And not exposed to scolds or riot;
> Where currish paws may never smite her,
> Nor snappish strangers come to fright her:
> She has not been in place before,
> Scarce passed indeed her mother's door—
> But skill and care she there has gained,
> To all her future duties trained:
> Her mother being miller's cat,
> Had opportunities for that;
> And this advertisement is written
> By one who knows and loves the kitten.
> Her skipping days of idle fun
> Are just at point of being done:
> No more she cares a cork to trundle,
> Or play with Janet's silver thimble;
> No more she seeks a clue to trail,
> Or vault athwart her mother's tail;
> No more her shadow now she chases,
> Or hunts the leaves in windy places;
> No more upon the panes she springs,
> To catch a fly on buzzing wings.
> No: graver grown, on other game
> She now has learned to fix her aim:
> Already can she mimic sleep,
> By pantry door the guard to keep;
> Or watches patient till she sees
> The mice appear from hollow cheese,
> Where, eating long, they love to dwell
> And play within the hollow shell.
> And now, with character so proper,
> From decent service what can stop her?
> She would not wish indeed to wrestle
> Amid the farmer's endless bustle;
> Where mastiffs, children, pigs, and rats,
> Are equal enemies to cats:
> Nor would she, high though wages be,
> In skipper's cabin go to sea:
> She has no skill, nor had her mother,
> To jump on ropes, or guess the weather
> But yet (for other service ready)
> She'd act, well qualified and steady,
> Companion to an ancient lady;
> Beside her walks would pace along,
> With arching tail and purring song;
> Within her bonnet would not sleep,
> And awkward hours would seldom keep.
> Such place, she thinks, would suit her well;
> So, if you know it, come and tell.
>
> *Postscriptum*—Would have no objection
> To give assistance in the kitchen:
> Would look at times into the dairy,
> Or tend the lady's aviary.

D. M.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM OER, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 76. SATURDAY, JULY 13, 1833. PRICE THREE HALFPENCE.

QUOTATIONS.

THERE are a few unfortunate passages in the works of the British classic writers, which exist in a state of perpetual torture and suffering, being taken hold of on all possible occasions by modern authors, and forced to tag out their meaning whenever they are at a loss for an idea out of their own heads. Weak writers—a body who, if numbers signified strength, would be most respectable—could never get on if it were not for quotations; but while it is fun to them, as in the famous case of the boys and frogs, it is death or worse to the gentlemen whose writings are thus pillaged. The reading of Hamlet, for instance, is positively spoiled, in consequence of the ridiculous associations which arise at every other line, in consequence of the uses made of it by the herd of writers whose works are most commonly in our hands. "Alas, poor Yorick!" has lost all its pathos, from its being applied to every funny fellow who has died during the last two centuries, or at least since the days of Sterne; and we now look upon the declaration of the Prince of Denmark, as to the improbability of there ever being another man like his father, as the height of nonsense; seeing that "we ne'er shall look upon his like again" has been said in half the obituary notices of equivocal public characters we can recollect having ever perused. The better plays of Shakspeare are all in pretty much the same predicament. The felicity of that man's diction has been the death of him, and we find him bad because he is so good. We loathe Macbeth, because we never hear in modern literature of a man making wry faces at medicine, but what we are informed that he exclaimed, in a burst of antipathy, "Throw physic to the dogs—I'll none of it!" We detest King Richard, because there is not an ill-mounted sportsman in the country who will not cry "Bring me another horse." Even the fine fancies of the Tempest are become disagreeable to us, since the remark of Trinculo, that "misery makes us acquainted with strange bed-fellows," has been found applicable to so many circumstances. All this, of course, is a fine illustration of the danger in which a man stands from his friends.

Small scribblers in newspapers, contributors of paragraphs about public rejoicings, private festivities, and other local matters, seem to find quotations particularly indispensable, their intelligence being generally so trivial and vapid as to be unfit to stand by itself. In a public rejoicing, the bells are always sure to "ring out a merry peal," and the crowds of people to be "thick as leaves in Vallambrosa." In the case of a ball, the "light fantastic toe" comes finely in; in that of a dinner, the night invariably "drives on wi' sangs and clatter," and the company would take scorn to separate before "the wee short hour ayont the twal." If the undue interference of a magistrate be commented on, then to be sure we have the unhappy Shakspeare dragged in to administer censure—

> "Oh man, vain man,
> Dressed in a little brief authority," &c.

In fact, these tags of old authors serve as points to the blunt and aimless sentences of the moderns. We, now-a-days, have all of the epigram but the sting, and that we are obliged to borrow from our predecessors. Who ever speaks of obscure genius, but he seizes upon some such recondite passage as

> "Full many a flower is born to blush unseen,
> And waste its sweetness on the desert air?"

Who ever describes eloquent writing, without bringing in our old friend—

> "Thoughts that breathe and words that burn?"

Who ever indicates the variety of styles in any particular writer, or in his own compositions, without going

> "From gay to grave, from lively to severe?"

Or who ever writes a sententious account of an unfortunate wretch, but concludes with the pithy remark, that he was only suited to

> "Point a moral or adorn a tale?"

And, above all, who ever tells us in print of the rarity of the appearances of any object, animate or inanimate, without taking a vast deal of pains to mention that they were

> "Like angels' visits, few and far between?"

Oh, these angels and their visits will surely some day be the death of us.

Can any one think of a teacher, but he must draw upon Thomson for—

> "Delightful task!" &c.

or upon Lord Brougham, for his still more celebrated declaration, that "the schoolmaster is abroad"—a phrase now absolutely nauseous from frequency of repetition. When a fine new colony is spoken of, it is of course "a land overflowing with milk and honey," even although bees should not have yet found their way to the country, and cows are so scarce (owing to their having to be carried eight or ten thousand miles), that they sell at sixty pounds each, and only can be had by the people of first-rate fortune. When a population is happy in an old country, every man "sits under his own vine and fig-tree," though it is more likely, that, while some enjoy themselves in their dining-rooms beside a coal fire, others frequent the neighbouring ale-houses during the first three days of the week, being able to make enough to live upon, by working during the remainder. A slight inapplicability, however, is nothing in a quotation, provided only that it give a kind of sense and expression to a sentence which would otherwise be void of both. Thus, a description of an island may be rather tame, the object being itself perhaps rather so; but if by hook or by crook it can be

> "Placed far amid the melancholy main,"

(though possibly only two miles from shore), then does it catch a grace from another and more poetical mind, and passes off well enough. On the same principle, we will wish for

> "——— a lodge in some vast wilderness,
> Some boundless contiguity of shade;"

though, in reality, a walk in some neighbouring plantation, upon which we are forbidden to intrude by men-traps and spring-guns, would satisfy us to our heart's content.

To be serious: Modern English writers act very sillily in introducing so many quotations from the works of former authors. Such a practice indicates not only a want of taste, but a want of the powers of original thinking, or, at the least, a want of confidence in these powers. We are of opinion that every writer should stand on his own merits alone. The sentiments to be expressed ought to be given to the reader in a plain straight-forward manner, without affectation, and in as simple and intelligible a language as possible, without the extrinsic aid of trappings from the productions of others.

Quotations of words and sentiments from the Latin, French, or other foreign tongues, are particularly hateful. The exclamation, "O tempora, O mores," has been applied to every period and state of society during two thousand years, and it is really time it were abandoned. The sin of introducing classic phrases, or of alluding on all occasions to heathen deities, is certainly now much less common than during a former age, when pedantry was frequently accepted as a proof of refinement; still they are too frequently indulged in. The puerile and fictitious transactions of Homer's heroes and heroines are a source of particular annoyance: we feel convinced that if any man would purge our literature of allusions to the "shield of Ajax," he would deserve a reward for his great public service. Surely our own noble and expressive language is sufficient for every useful and ornamental purpose in every kind of composition calculated for popularity. Away, then, with the paltry practice of interlarding English writing either with foreign words, or what are styled classic allusions, which are injurious to good writing, of no value whatever to that which is bad, and in almost every case thoroughly useless.

GREENWICH.

I HAD been several times in the metropolis, and had seen all the sights worthy of being seen before I proceeded to take a view of Greenwich Hospital, a structure which is, perhaps, the finest specimen of the Grecian style of architecture in this country. Greenwich Hospital is altogether, that is, both as a building and as an institution, worthy of respect and admiration. It is unique in its kind, and is certainly worthy of the great people who have established and support it. Yet Greenwich very frequently escapes the observation of strangers in London, and is far from being fully appreciated. Let us try to give our readers an idea of its appearance and character. Greenwich is a small town, lying on the south bank of the Thames, and distinct from London, but now, in some measure, involved in its extending suburbs, and may be reached either by boats on the river, or by stage coaches from various parts of the city. As a town, it is of no moment: its hospital and parks are the only objects of attraction to visitors. As you enter its streets, you perceive that it possesses a sea-faring look, and does not resemble the inland places of population in the environs of the capital.

Towards its eastern extremity stands the hospital, which faces the Thames, and has a perfect command of all that passes on the river. This superb hospital consists of four edifices, unconnected with each other, but apparently forming an entire structure, lining three sides of an open square, that side on which there is no building being next the water. The whole is built of fine stone, in the best possible style; and along nearly the greater part are lofty colonnades, with handsome pillars, and covered over head, to protect those underneath from the weather. The square interval in the centre, which is 273 feet wide, is paved also with smooth stone, and ornamented in the middle with a statue of George the Second, by Rysbrach. Beyond the edifices, on the south, rises the splendid park of Greenwich, dotted with luxuriant tall trees, and crowned at the top with the Royal Observatory buildings. But the eye of the visitor is probably more attracted towards the living than the inanimate objects of this beautiful scene. It is a charming evening in June; the sun, which has been shining all day, has softened the atmosphere into a pleasing temperature; his slanting rays play among the pillars, and induce the venerable inmates of the establishment to come forth from their various wards, and recline among the colonnades, or lean over the railings in front, and criticise, with listless curiosity, the various craft pursuing their way up or down the Thames.

A portion of these beautiful buildings was originally a palace of Queen Elizabeth, since whose time various renovations and additions have been made, but chiefly in the reign of William and Mary, who, in the year 1694, here established an hospital for invalid seamen, to which purpose the buildings are still exclusively devoted. By the last accounts it contains 2710 pensioners, 168 nurses, with a variety of officers for the government of the house; and gives support to 32,000 out-pensioners. The institution is supported by a payment of sixpence per month from every sailor in the royal navy, by certain dues and donations, and other means. The number of individuals who reside within the walls is nearly 3500. The inmates have a strikingly antique air. They are all old sailors, with countenances well browned by

tropical suns, and bleached by the tempests of the ocean; some hobbling on a timber toe; others with an empty sleeve; a few with only one eye, the other being burnt out, no doubt, by gunpowder, during some hot work one day in the Channel; occasionally you may see one pulling an old maimed and decrepid shipmate in a wheeled chair along the terrace; and all, less or more, looking as if they had seen a good deal of service. And such funny dresses these old chaps have on. Their clothes are all of a dark blue colour, of so antiquated a fashion that you could almost fancy that each had accompanied Dampier, Woods Roger, Captain Cook, or some other of our old navigators, in their voyages round the globe. A number wear cocked hats, which add vastly to their supposed antiquity; and you may remark that the boatswains, or other warrant officers, are allowed a yellow trimming or lace to their garments.

I never any where remarked such an air of contentment, comfort, and peacefulness, as in this well-regulated establishment. An abundance of food is allowed, the clothing is warm and comfortable, the residence is good and respectable, and each man, according to his rank, has from a shilling to half-a-crown a-week, as an allowance for pocket-money. Where, where, may we ask, shall we find such an instance of national bounty as is here displayed? There is one thing which will particularly please the stranger at Greenwich: he will no where see pampered and insolent menials acting as exhibitors of the place, and extorters of money from the public. There are no over-dressed and saucy waiting-maids or footmen, as at Windsor, Hampton Court, and other places of note in the vicinity of the metropolis, ready and willing to lay the pockets of the visitors under contribution. The outer gateway, and the interior parts of this establishment, are under the care of the pensioners themselves, who show the utmost attention to strangers, and that with a politeness and good nature characteristic of the profession of the sailor. Small sums are taken for exhibiting the different places worth seeing, but the money goes to the general fund, or for the board and education of the children of seamen; and I remarked that the amount tendered was instantly transferred to the box for its reception. It is worth while remarking these circumstances, as nearly the whole system of exhibiting national edifices and institutions in Great Britain is vile and mercenary.

The chief *lion* of the establishment is the painted hall, which is in the west wing. It consists of a great room—a double cube of fifty feet—and one smaller, but equally lofty, leading from its upper end by a flight of steps. A vestibule and flight of steps are between the outer doorway and large room. The appearance of the whole interior which is gained on entering is very imposing, the high roof being covered with paintings, as also the farther extremity fronting the entrance; and although these paintings, from exhibiting a mixture of fantastic heathen gods and goddesses, with royal and other portraits, are by no means in good taste or of any value, they serve to give a fine effect to the noble apartments they adorn. Along the walls are hung a collection of pictures, partly portraits of distinguished navigators and admirals, and partly depicting distinguished naval victories, each being a present to the institution by some kind benefactor. A good portrait of Captain Cook, by Dance, presented by Sir Joseph Banks, adorns the vestibule. A number of portraits, by Sir Peter Lily, Dahl, Sir Godfrey Kneller, and others, have been presented by George the Fourth. There are also several by Sir Joshua Reynolds. A little garrulous old sailor, with a single sparkling eye, and a wonderful warmth of devotion to the excellencies of the institution, points out the beauties of the various artists, and descants on the extraordinary deception in the perspective of the figures, which he again and again assures you do not stand out from the walls, or from the plaster, but are quite flat, and "all as smooth as glass." The painted ceiling of the great room was executed by Sir James Thornhill in 1703, and several subsequent years, but, from a miscalculation as to the time he had expected to do the work, it seems it scarcely rewarded him and his assistants in this elaborate undertaking. It is related that, in consequence of the length of time he had to lie on his back painting the ceiling, he could never afterwards sit upright. In the smaller apartment are shown several models of ships of war, admirably executed in wood; the coat worn by Nelson at the battle of the Nile; and the astrolabe of Sir Francis Drake, a curious brass instrument of antique fashion, used for nautical observation. It has been computed that nearly fifty thousand persons now annually visit this magnificent suit of apartments, in which the excellent taste and judgment of the distinguished architect, Sir Christopher Wren, are displayed, not only by their just proportion and embellishment, but in that studious regard to picturesque form and outline which he had bestowed in all his designs.

From the painted hall the stranger proceeds to view the chapel of the Hospital, which is on the eastern side of the square, and is equally worthy of attention. From a vestibule a flight of steps leads into the chapel through a beautiful portal with large folding doors of mahogany. The chapel, which measures 111 feet long and 52 broad, is, without exception, the most elegant and chastely-constructed apartment of the kind in this country. It is quite a model of perfection as a place of public worship, and can accommodate 1000 sitters. The pulpit is of lime-tree, resembling satin or box wood, and, with the desks below, could not be surpassed in simplicity and beauty of execution. A picture showing the escape of St Paul from shipwreck, executed by West, is painted over the communion-table. It is a confused mass of figures, and unworthy both of the artist and the situation it occupies.

After viewing the Hospital, the strangers, perhaps, proceed into the town to take the refreshment of tea, Greenwich being a place of constant summer resort by parties of Londoners, who come to indulge in this evening meal, and for which species of accommodation the inhabitants seem to lay themselves out. Having, therefore, taken tea in some neat sunny room close by the terrace on the river, the visitors walk away towards the extensive parks on the rising ground above the Hospital. These are very extensive grounds of great natural and artificial beauty, and open to the perambulations of all classes of persons. A beaten track or pathway amidst the lines of tall leafy trees leads to a rising ground or mount—quite a hill to a Londoner—and which is crowned with the buildings of the Observatory. From this spot are calculated the degrees of longitude in all English maps and charts. Standing on the summit of the rising ground, with your back to the outer wall of the Observatory, or sitting down on the wooden bench placed for the comfort of those tired in making the ascent, and casting your eyes north and westward, your vision can embrace little else than a vast tract of houses, chimneys, and steeples, composing the overgrown metropolis of England; on your right, far away to the east, you see the soft slow waters of the Thames winding a serpentine course through a rich flat territory, its surface spotted with the sails and masts of vessels of all dimensions; while immediately below repose the magnificent structures we have been noticing, environed by the thick green foliage of the trees of the park, and calling up feelings of pleasing gratification that Great Britain maintains an institution so truly worthy of her great name.

Column for Schoolboys.

SALLUST—CÆSAR.

We have no doubt, that, after having been introduced, as it were, into the porch of the temple of Roman literature, by means of Phœdrus, Eutropius, and Nepos, our young friends will now have a strong desire to be made acquainted with the more important departments, and to get intimate with the greatest of the historians, poets, and orators of that famous nation, which was long the mistress of the world. Among these great historians, Sallust is the one who is first selected for the delight and instruction of the tyro.

Sallust, whose full name in Latin is Caius Crispus Sallustius, was born at Amiternum, a town in the territory of the Sabines, not far from Rome, about 85 years before Christ. His family appears to have been only of second-rate consequence in the country; and, indeed, his own name seems to have been the first belonging to it that attained either rank or celebrity. The mind of Sallust was early turned to literary pursuits, and, under the celebrated philologist, or teacher of elocution, Ateuis Prætextatus, he is said to have made uncommon progress in his studies. Although he possessed an acute genius, and literary talents of the first order, yet it must be owned that he soon began to tarnish his character by indulging in vices of the most degrading kind. From this it is evident that it is not enough that a schoolboy should be possessed of abilities of the first order, and by diligence in his studies should outstrip all his competitors in the race of learning, but he must also have good principles of moral conduct sown in his mind, and cultivated there along with his learning, otherwise he is in danger of presenting to the world, as Sallust did, only the character of a clever bad man, which is one of the most pernicious that can be imagined. Very few particulars regarding the juvenile habits of Sallust are known, and still fewer are worthy of being recorded. Unfortunately, during the age in which he lived, licentiousness and corruption had reached their highest pitch in the Roman state; and he seems to have gone headlong into the indulgence of ambition and luxury—those vices which soon overthrew the liberties of the Romans. At what age ambition seduced him from the path of science and of virtue, no certain account has been transmitted; but his juvenile years seem to have been soon given up to vicious indulgences. At the age of thirty-two he was appointed a tribune of the people, a plebeian magistrate in Rome, whose duty it was to defend the commons against any extortion or oppression that might be practised upon them by the higher classes. According to some, it was at this election that Cato of Utica was his rival; and to his success over that stern patriot, which was a disgrace to the Roman state, he alludes with considerable vanity in the introduction to his work on the Jugurthine war. Availing himself of every advantage afforded by his office, he was active in procuring the sentence of banishment in the celebrated case of Milo, who murdered Clodius, and which is handled with first-rate eloquence in the orations of Cicero. Sallust maintained a constant enmity against Cicero, which originated, perhaps, in the opposite nature of their moral and political principles; and he carried on this enmity so vigorously after Cicero had crushed the terrible conspiracy of Catiline, that, timidly yielding to the clamour of his persecutors, that great man went into voluntary banishment. Licentious and corrupted as the Romans at that time were, the lewdness and depravity of Sallust did not escape severe censure. In the year 49 before Christ, he was degraded from the rank of a senator, and remained two years in ignominious retirement. By the interest of his great patron Julius Cæsar, however, he was soon brought again from his obscurity, and raised, first to the senatorial dignity of quæstor, and soon after to that of prætor, which was a dignity next in rank to that of consul or supreme magistrate. Cæsar appointed him one of his lieutenant-generals, and gave him the command of a considerable body of troops, whom he was to march to the coast, and embark for Africa, to crush the republicans under Cato and Scipio. These troops, having been long on hard service abroad, mutinied on learning the place of their destination; and Sallust, after many promises and threats to no purpose, had to consult his safety by flight. The mutineers then marched back to Rome, putting people to death, and committing many excesses; but Cæsar went out alone to meet them, and, by a short speech, brought them to submission, and made them ashamed of their conduct, and beg his forgiveness. After Cæsar had been some time in Africa, dreading a scarcity of provisions, he gave part of his fleet to Sallust to take possession of the island of Cercina, to the north of the gulf called Syrtis Minor, on the African coast, where the enemy had a valuable magazine. There is no other important occurrence, either naval or military, in which Sallust seems to have had a principal concern. That he conducted himself during the whole war to the satisfaction of his general, is unquestionable, from his being appointed governor of the province of Africa, extending from Libya to the Atlantic Ocean. Such was the rapacity and oppression which he exercised here, that, in one year, he amassed a prodigious fortune, part of which he expended on the extravagant but beautiful gardens at Rome, which, to this day, bear his name. He died at the age of fifty-one, thirty-five years before the Christian era.

Sallust wrote detached parts of Roman history, which were much esteemed, and, indeed, considered by many superior to the work of Livy, the writer of the whole history of Rome; but only a few fragments of Sallust now remain. His history of Catiline's conspiracy, and of the Jugurthine war, have been transmitted entire; but of his other histories only detached pieces are preserved. These remains of his works give sufficient proof that his talents for historical composition were of no ordinary kind. A sententious brevity, which has been greatly and deservedly admired, is the distinguishing characteristic of his writings. His style is perspicuous, animated, and forcible; his descriptions lively, picturesque, and beautiful; and his speeches energetic, appropriate, and persuasive. He is too apt, however, to run into frequent digressions, which have little connection with his subject, apparently with no other view than to show the extent of his information, or the superiority of his abilities. His prefaces to the conspiracy of Catiline and the Jugurthine war, are, instead of pertinent introductions to these histories, compliments paid by the author to his own character and pursuits. In the commendations of virtue and censures of vice, which are given in various parts of his works, it is impossible not to charge him with hypocrisy, when we consider the gross immoralities of his own life, and that he most probably composed these very works where he could not turn his eye but every object reminded him of the crimes which he had committed against the unhappy natives of Africa. That genius and virtue are occasionally disunited, has been often observed, and the life of Sallust certainly justifies the remark. The powers of his mind cannot be contemplated without admiration, nor the depravity of his heart without contempt. The excellencies of the historian may indeed be studied with advantage, and copied with safety, but the character of the man neither claims respect, nor merits imitation.

The history of Catiline's conspiracy, as given by Sallust, is one of the most interesting portions of the

whole history of Rome. The destruction of Rome by fire, and the massacre of all the citizens most remarkable for wealth, high rank, and patriotism, formed part of the plan of this nefarious transaction. With this view Catiline raised an army, to which, by the vigorous and decisive measures of Cicero, he was compelled to withdraw himself, after his designs on the city, and on the consul and senate, had failed. At the head of his troops he displayed great bravery; and preferring death to the fate which he knew awaited him if made prisoner, he fell in the midst of the enemy, fighting resolutely till the last. This happened in December, 65 before Christ.

The war with Jugurtha, which forms the subject of the other principal portion of Sallust's work, presents a very interesting theme, which is treated of with great eloquence by this historian. Jugurtha was a native of Numidia, an ancient kingdom of Africa, corresponding nearly with the modern one of Algiers, of which his uncle, Masinissa, was king, and in his family he was brought up. Masinissa treated him with great kindness, and at last left to him, along with his own two sons, a third part of his kingdom. Jugurtha soon procured the death of the two sons, seized their possessions, and then attempted to bribe the senate of Rome to secure him in the kingdom which he had thus obtained by murder. In this, however, he did not succeed, and the Romans at length declared war against him. For a long time he successfully resisted, and frequently defeated the Roman forces; but at last he was betrayed by his father-in-law, Bocchus, king of Mauritania, into the hands of Marius, the Roman commander, who led him in triumph with his two sons, after which he was put to death in prison, in the year 107 before Christ. Sallust's account of this war is considered one of the purest models of historical composition.

The following is a part of the description of Africa, which he gives in his "Jugurthine War:"—"In dividing the world, Africa by most people is considered as forming a *third* portion; but some are of opinion that we should reckon them to consist of Asia and Europe only, including Africa along with Europe. It has the straits of our sea and the (Atlantic) ocean for its boundary on the west; to the east it has an extensive plain country, which is called by the inhabitants *Catabathmon* (the low country.) The African sea is wild, and destitute of harbours. The land is fertile of fruits, good for cattle, but unproductive of trees: little water either from the sky or from the earth. The people are of a healthful habit of body, swift, and patient of fatigue: they die for the most part of old age, unless they are taken off by the sword, or by wild beasts; for disease seldom gets the better of any of them: there are, however, immense numbers of animals of a hurtful kind. In regard to the people who originally inhabited Africa, or those who afterwards joined them, and in what manner they became intermixed with one another, although, according to general report, there are various accounts given, yet we shall give it as it has been explained to us out of the Punic books, which were said to have belonged to king Hiempsal. I shall show, then, in as few words as possible, how the matter is, according to the opinion of the inhabitants of that country; the credit of the thing, however, will depend entirely upon the authors. Africa (they say) was at first inhabited by the Gætulians and the Libyans, a savage, uncultivated people, who used the flesh of wild animals, and the spontaneous produce of the ground, for food, like the beasts. These were ruled by the customs, or laws, or authority of no one; scattered about, and wandering up and down, they fixed their quarters wherever the approach of night compelled them to settle. After Hercules, however, as the Africans think, had perished in Spain, his army, which was composed of many various nations, being without a leader, and each one seeking the supreme authority for himself, it fell to pieces in a short time; and of that number, the Medes, the Persians, and the Armenians, having passed over to Africa in ships, occupied the parts nearest to our sea. The Persians, however, went more towards the (Atlantic) ocean; and these used the inverted keels of their ships for habitations, for the fields there afforded no timber, and they had no means of buying or borrowing it from the Spaniards. The extent of the sea, and their ignorance of the language, precluded them entirely from commerce. With these, by degrees, the Gætulians mingled themselves by intermarriages; and because they tried many different parts of the country, and sought a settlement sometimes in one place, sometimes in another, they gave themselves the appellation of *Numidians* (that is, *Nomades*, or wandering tribes)."

Leaving Sallust to pursue his narrative at leisure, we beg now to introduce to the acquaintance of our juvenile readers no less a person than the celebrated Julius Cæsar, who, both as a warrior and a writer, is one of the most eminent men of antiquity. We do not mean to enter at all fully into the history of this great character at present, as the account of his life forms, perhaps, the most important page in the whole Roman history; and, consequently, we think no one can long remain ignorant of what is laid down fully in every history of Rome.

Caius Julius Cæsar, the illustrious Roman general and historian, was the son of Caius Cæsar, and Aurelia, the daughter of Cotta, and was born at Rome in the year 90 before Christ. He is said to have been brought into the world by being cut out of the body of his mother; and hence this operation is still called among surgeons the *Cæsarian operation*. At the age of seventeen, he obtained the office of high priest of Jupiter; and by his great abilities, as well as by his marriage with Cornelia, the daughter of Cinna, he soon excited against himself the enmity of the infamous tyrant Sylla; and to escape assassination, he was obliged to conceal himself for a time amongst the vestal virgins. The first military honour which Cæsar obtained was a civic crown, at the siege of Mitylēnē, when the Roman army was commanded by Thermus, the prætor. By his valour and eloquence he soon acquired the highest reputation in the field and in the senate, and successively obtained the important offices of Quæstor (Treasurer), Ædile (Comptroller), Pontifex Maximus (Supreme Priest), Prætor (Chief Magistrate), and Consul (Chief Commander). Beloved and respected by his fellow-citizens, he thus enjoyed successively every magisterial and military honour the republic could bestow, consistently with its own free constitution. Of all the Roman citizens of those times, Pompey possessed the greatest power, Crassus the greatest riches, and Cæsar the greatest abilities. Amongst these was formed a coalition or conspiracy against the liberties of Rome, and they solemnly swore that nothing was to be done in the state but by their common consent. This combination is known in history by the name of the first *Triumvirate*, from its consisting of *three* individuals; but shortly the state came to be wholly managed by Cæsar, and the violence of his proceedings at length rendered the *Triumvirate* an object of abhorrence to all classes of the community.

Cæsar is supposed to have set out for *Gallia Transalpina*, or Gaul beyond the Alps (that is, *France*), in the end of March, in the year 57 before Christ. Of his conquest of that country—his checking the inroads of the Germans—and his crossing over to the island of Great Britain, a great part of which he conquered or overran—his Commentaries of the Gallic War contain a rapid, but well-written account. The young reader must not infer, however, that all his engagements with these nations are there fully recorded, or every circumstance of his conduct with regard to them either minutely or faithfully detailed. Respect for his own character, perhaps, induced him to conceal many particulars, and to hint at rather than describe others. The precise time in which he conquered Gaul and Britain is not ascertained. Some make it ten years, others eight, but he himself seems to mention nine. The rivalship between him and Pompey at length came to a head; and Cæsar's crossing the small river Rubicon, the boundary between Gaul and Italy, which the laws did not permit him to pass while in command of an army, was an actual declaration of hostilities against those in authority at Rome. After this, as is well known, he drove Pompey out of Italy—conquered that general's best troops in Spain—totally defeated him at Pharsalia in Greece—subdued the kingdom of Egypt, which he bestowed on Cleopatra—and then defeated the king of Pontus, and subdued his country, with such ease and rapidity, that, in writing an account of it to a friend at Rome, he employed only three words—*Veni, vidi, vici*, I came, I saw, I conquered!

After this, Cæsar visited Italy, and then crossed over into Africa, where he defeated the republican forces under Scipio, in an engagement near Thapsus, and reduced the kingdom of their ally, Juba, king of Mauritania, to a Roman province. Returning to Rome, he triumphed, at the interval of a few days, four different times, in consequence of having conquered Gaul, Egypt, Pontus, and Africa, *i. e.* Numidia and Mauritania. The plunder of so many countries enabled the conqueror of the world to glut his soldiers with presents, and the citizens with largesses, shows, and entertainments. But his boundless ambition soon began to efface the glory of his former actions; for, pursuing his favourite maxim, "that he had rather be the first man in a village than the second in Rome," he procured himself to be chosen perpetual dictator; and not content with this unconstitutional power, his faction had resolved to raise him to the imperial dignity. This, however, was prevented by the friends of the civil liberties of the republic, the chief of whom was Brutus, and Cæsar was by them rashly and basely assassinated in the senate-house, when they should only have seized him, and brought him to a legal trial for usurpation. He fell by the daggers of the conspirators, on the 15th of March, 44 before Christ, in the fifty-sixth year of his age, pierced by twenty-three wounds, after he had enjoyed the peaceful possession of the empire only five months.

To the talents of a consummate general, Cæsar added those of an elegant historian and a persuasive orator. Much of his commentaries, or journals of the Gallic and civil wars, were, it is said, composed on the spot where his battles were fought. The purity and neatness of his style, notwithstanding the rapidity with which he must have written, have not been surpassed by any Roman writer. His narrative is at once perspicuous, simple, and natural; and it is, at the same time, chaste and animated. Few passages occur in his writings which the most illiterate do not understand, and the most polished do not approve.

Besides a few juvenile pieces mentioned by Suetonius, and a collection of apophthegms, or remarkable sayings, Cæsar left, at his death, two books on grammar, and a poem which he called *Iter*, or The Journey. But these, as well as his letters to the senate and his friends, are lost. None of his writings now remain, except seven books of the Gallic, and three of the civil war. The eighth book of the Gallic war is the composition of Aulus Hirtius Pansa; but it is not known who wrote the accounts of the Alexandrine, African, and Spanish wars, although the two first are by some also ascribed to Hirtius Pansa.

THE MODERN JEWS.

(Second Article.)

The religious polity of the modern Jews was established during the Babylonian captivity, which followed the destruction of the first temple by Nabuchadnezzar, B. C. 587. The sacrificial service constituting the principal feature of the public worship of the Jews, ceasing with the destruction of the temple, left them without any religious system, or scheme for the regulation of public or private prayer. To remedy this evil, so dangerous to their existence as a distinct people, and to their pre-eminence as worshippers of Almighty God, Creator of Heaven and Earth, Ezra the Prophet, conjointly with his conclave, known by the name of the "Men of the Great Assembly," collected all the prayers that had heretofore been used, composed others, and arranged the whole into specific portions. They instituted the morning, afternoon, and evening service, in reference to the daily sacrifices in the temple at those stated periods; appointed additional services for the festivals, conformable with the additional sacrifices in the temple on those days, besides numerous other prayers to be said on all those special occasions in which it had been customary to offer special sacrifices. These prayers are universal among all the Jews of the known world, and are still repeated by them in the language in which they were composed, viz. the Hebrew. Their original arrangement for private and public worship continues till the present day, which makes the liturgy of their synagogues in all countries nearly the same. This uniformity of language and discipline in worship has this advantage, that the Jew, in whatever country his destiny carries him to, finds no difficulty in uniting with his brethren in that country in the performance of those several duties which his religion requires of him.

Although the daily liturgy was ordained as above stated, in reference to the sacrificial service of the temple, yet there can be no doubt that the practice which existed long previous to the formula of Ezra, of praying three times a-day, also influenced this arrangement—Psalm lv., v. 17, "Evening, and morning, and noon, will I pray;" and the Book of Daniel, vi. 10, "Daniel, with his face towards Jerusalem, kneeled upon his knees three times a-day, and prayed, and gave thanks before his God *as he did aforetime*," confirms this practice of daily prayer; but as it does not appear that these prayers were specially enjoined, or were other than the extemporary ejaculations of praise and thanksgiving to Almighty God which piety prompted, the merit of the institution of these daily prayers must still rest with Ezra and his conclave, who, if they did not originate the practice of daily worship, rescued it from the corrupt Hebrew of the captivity, and gave it its present regular and established form.

The private devotions of the Jews commence with the morning prayers, which fill nearly fifty pages octavo, and occupy about an hour in their recital. These prayers are replete with the most devout piety, pure morality, and heavenly philosophy; the beauty of their composition stands unrivalled, and, taken altogether, are well calculated to perpetuate that enthusiastic veneration for their religion which centuries of persecution have never been able to subdue or overcome. The morning prayers open with a hymn by Mamonides, in which the existence of God, his eternity and immortality, are proclaimed; and reliance on his providence, rewards, punishments, and the resurrection, is expressed. It is, in fact, a poem expressive of their articles of faith, and is held in much esteem. Our limits will not permit us to go through the whole of these prayers, but we shall give a few short specimens, which will repay the reader's perusal.

THE IMMORTALITY OF THE SOUL PROCLAIMED.

"My God! the soul which thou hast given unto me is pure: thou hast created, formed, and breathed it unto me: thou dost also carefully preserve it within me, and thou wilt hereafter take it from me, to restore it unto me in futurity. During the time that my soul continues within me, will I be making acknowledgments to thee, O Lord my God! and the God of my ancestors, Sovereign of all creation, Lord of all souls! Blessed art thou, O Lord! who restorest the souls unto the dead."

PRAYER, REMARKABLE FOR ITS SIMILITUDE TO THE LORD'S PRAYER.

"May it be thy will, O Lord our God! and the God of our fathers, to cause us to become habituated to thy law, and attached to thy precepts: O lead us not into the power of sin, transgression or iniquity, temptation or contempt: suffer not evil imagination to have dominion over us, but place us at a distance

from evil men and wicked associates; cause us to become attached to good intentions and good works, and coerce our passions to be subservient unto thee. O grant us this day, and every day, grace, favour, and mercy, in thy sight, and in the sight of all who behold us; and dispense kind favours upon us. Blessed art thou, O Lord! who bestowest gracious favours on thy people Israel."

DUTY.

"Man should ever feel an inward fear of God, declare the truth, and commune with truth in his heart; let him rise early and pray."

HUMILITY.

"Sovereign of all worlds! It is not on account of our righteousness that we presume to lay our supplications before thee, but on thy abundant mercies. What are we?—What our righteousness?—What is our help?—What our power?—What shall we say in thy presence, O Lord our God! and the God of our fathers? Verily, the mightiest heroes are as nought before thee; men of renown as though they had not existed; wise men as without knowledge; and the intelligent as if void of understanding: for the majority of their actions is emptiness, the days of their life but vanity in thy presence: even the pre-eminence of man over the brute is nought; for all is vanity."

The mind being thus prepared by prayer, and brought to a consideration of the awful presence, the ceremony of putting on the phylacteries follows.

They are worn by all male adults during the morning service. For all the purposes of ceremonious worship, a youth of thirteen years is deemed of age. The wearing the phylacteries may be termed his initiation. The phylacteries consist of the articles of Hebrew faith, written on vellum, and inclosed in a leathern case, and are bound round the left arm, so that the case containing the sacred writing lies next the heart, in obedience to the injunction in Deut. vi. 6, "And these words which I command thee this day shall be near thy heart." There is a second phylactery, in every respect the same as the one just described. The case containing the articles of faith is placed on the forehead, so as to be "as frontlets between the eyes" (Deut. vi. 8). The strap of the phylactery of the arm is then wound thrice round the middle finger, in reference to the command, "And thou shalt bind them for a sign upon thine hand" (see the same verse), in doing which the following is said in a solemn low voice:—

"And I will betroth thee unto me for ever; yea, I will betroth thee unto me in righteousness, and in judgment, and in loving kindness, and in mercy; I will even betroth thee unto me in faithfulness, and thou shalt know the Lord.

"Blessed is he who but spake, and the world was called into existence: blessed is he. Blessed is the primeval creator. Blessed is he who sayeth and performeth. Blessed is he who ordaineth and establisheth. Blessed is he who hath compassion on the earth. Blessed is he who hath compassion over all creatures. Blessed is he who graciously rewardeth those who revere him. Blessed is he who liveth for ever, and existeth eternally. Blessed is he who redeemeth and delivereth. Blessed is his name."

Portions of the psalms then follow in order, next the declaration of the unity (Deut. vi. 4) and the sacred prayer of the eighteen verses, during the recital of which it is not permitted to speak; it must be said standing, and with the face toward the east. In the 1st verse of this prayer God is blessed; the 2d, Immortality of the soul again avowed in the most touching language; 3d, Knowledge, 4th, Piety, and, 5th, Pardon, are prayed for; 6th, Temporal, and, 7th, Heavenly assistance, are prayed for; 8th, Blessings on the year, 9th, Freedom, 10th, The restoration of judges, and, 11th, Destruction of tyrants, are entreated; in the 12th, The pious of all nations prayed for, in the following words:—"May thy tender mercies, O Lord our God, be expanded over the just, the pious, and the elders of thy people, the house of Israel, the remnant of their scribes, *and the virtuous strangers*,* as over us. O bestow good rewards unto all who faithfully put their trust in thy name; and grant that our portion be with them, that we never be put to shame, for we do trust in thee. Blessed art thou, O Lord, the supporter and the confidence of the just."

The 13th verse prays for God's presence in the holy city, its rebuilding, &c; 14th, 15th, and 16th, seek the exaltation of Israel, and pray for salvation; 17th contains acknowledgment of humility, petition for peace, and a blessing upon Israel. The touching sublimity of the 18th is beyond the power of description: we give it in full.

"18th, Oh, my God! guard my tongue from evil, and my lips from uttering deceit. Towards those who curse me be my soul as dumb; and towards all be it as humble as the dust. Open my heart to the reception of thy law, that my *soul* pursue thy commandments. O frustrate speedily, I beseech thee, the devices, and destroy the machinations of all those who imagine evil against me. O grant it, for the sake of thy name; grant it, for the puissance of thy right hand; grant it, on account of thy holiness; grant it, for the honour of thy law, that thy beloved may be relieved. Let thy right hand save, and then answer me. May the words of my mouth and the meditations of my heart be acceptable in thy presence, O Lord my Rock and my Redeemer. May He who establisheth peace in his high heavens grant peace unto us, and all Israel. Amen."

* Deut. x. 19, "Love ye, therefore, the stranger; for ye were strangers in the land of Egypt."

THE WARDROBE OF THE DEAD.

Who has not heard of the green hills, the lofty woods, the deep dells, and silver stream of Yarrow; and of its many legends, its melancholy tales, and the numberless ballads and sweet songs they have given rise to; and who ever visited it without being deeply impressed by its magic scenes? This region of fancy, this land of romance, was the place of my birth; and to it the present little narrative is intended to add another feature of interest. I left it in my girlish days, for a distant country, where I remained an exile till the autumn of life began to steal upon me. It had been my fortune to journey in lands far famed for their beauty, where all that was lovely in picturesque scenery and genial in climate wooed the stay of the traveller: but no scene I had visited during thirty years could in my mind ever come into comparison with my native Yarrow. No one, I believe, ever felt more deeply the delight of revisiting the hallowed haunts of their childhood, than I did, when returned once more to my native vale. I made my way, on a bright ethereal morning in the beginning of June, through each well-remembered path, to the house of an early and much-valued friend. As I looked around me, I thought I had never seen, since I quitted this earthly paradise of my imagination, trees of such fresh and graceful foliage—groves so fitted for the dwelling-place of "heavenly pensive melancholy"—such green pastures—or, above all, a stream, which, as it glided along, seemed so to murmur through its deep recesses of a peace which the bustling world can never know. I had heard strange tales of the friend I was hastening to see—reports which grieved me to the heart, and which, though I found some comfort in the belief of their being exaggerations, still caused me a great degree of uncertainty and painful anxiety as to their truth. In short, I had heard in the neighbourhood that my old friend Mrs Haldane, who lost her husband and seven children before she had been ten years married, was supposed to be in a state of derangement.

It is not my intention to enter here into a minute history of either my friend's life or my own. I shall therefore only say, that her father and mine were schoolfellows, who retained for each other the strictest friendship through life. She and I each lost our mothers when very young; and on the death of her father, which happened when she was seventeen, being, like myself, an only child, my father brought her to live with us. At that time I was only ten years old, and it seemed the constant endeavour of the grateful Mary to repay my father's kindness, by restraining in me every perceptible tendency to evil, and by treating me with the most sisterly affection, which, together with the tenderness I experienced from my father, made those early days of my life one continued scene of happiness. No wonder, then, that these associations had kept alive an enthusiastic attachment to the place of my birth and the friend of my childhood, and caused me to return to them as soon as I set my foot on British ground. The peaceful days I had experienced under my parent's roof, were, however, cut short by his death, when I attained my twentieth year; and I went to reside in the south of England with a near relation, where I soon married, and went abroad with my husband. Previous to my father's death, our dear Mary had left us for a house of her own, having married a young man who had a long lease of an extensive farm in the vale of Yarrow. Her husband was said not to be the good character his wife had imagined. That their tastes were widely dissimilar, and that he frequently treated her with harshness, I could not fail to observe, though she never complained, and seemed so devoted to two sweet children, which were born before I left the country, that she appeared to me to enjoy a moderate degree of happiness. Eight years more, as I have said, had only passed over her head, when, after having given birth to seven children, she became a childless widow. It was the fear that her mournful fate might indeed have unsettled her reason, that filled my mind with the most nervous perturbation as I drew near to her well-remembered dwelling, which seemed in nothing altered from what I had left it, save that the trees which nearly surrounded it had extended their clustering foliage so shadingly over its roof, as to exclude from it the rays of the glorious sun which shone so resplendently on their outward branches, and thus gave it a more sombre cast than it was wont to have. But there were no signs of neglect. All around it looked neat and comfortable, and the roses and honeysuckles were as trimly trained against the walls as ever. My low and tremulous rap at the door was immediately answered by an old domestic, who, in spite of years and her grey locks, I recognised as the same Margaret who was my father's dairy-maid, and who went home with my friend when she married. I lost no time in making myself known to her, and inquired if I could see her mistress, which, after expressing her joy and wonder at my visit, she informed me I should soon do, as she was only taking her accustomed morning walk, from which she every instant expected her. Margaret then ushered me into a little parlour where she was preparing breakfast, and feeling glad to have this opportunity of hearing, before I saw her, something that I could depend upon about the state of my friend's mind, I gave some hints of the report which had caused me so much uneasiness. "She is nae mair beside herself than I am," said her faithful old servant; "though it is na to be wondered at that folks who have na the sense to understand her should raise sic reports," she continued, while an expression of indignation marked her intelligent features. "It is all because she has given up the world, having never gane off the farm since the last bairn died, and that's thirty years come next Martinmas. And mair especially because she makes herself sae happy in the thought that the weans are still about her."

"*About her!*" said I, repeating, with surprise and dismay, what I thought so extraordinary an assertion; "but is not that at least very strange?"

"I canna think there is ony thing strange in that," replied Margaret, "if ye mind how often the Holy Scriptures of truth tell us o' the visits o' angels to the earth, and how they are sent to attend and watch over us; and surely nane o' the angels in heaven can be sae sib till her as her ain bairns." Understanding from this that it was not their visible presence that was meant by their being *about her*, I willingly acquiesced in her ideas, and had just time to learn from her, before my friend appeared, that she had sub-let the farm to a person in the neighbourhood, making it a stipulation that she was not to remove from the house during her life, and that she received an advance of rent, which, together with some money left her by her husband, supplied her with ample means of beneficence to her poorer neighbours. Margaret met her mistress at the door, and having briefly informed her of my arrival, I was instantly folded in her arms, in one of those tender embraces which she had so often bestowed on me in my youth. I looked earnestly on her—she was much changed, but there were on her features none of those deep furrows, or harsh markings of time and intense mental suffering, which I had expected to see. On the contrary, her deep blue eyes beamed upon me with an expression of such ineffable peace, that, in spite of her melancholy history, I felt the conviction thrill through my heart, that I, with all my worldly attachments, was a much fitter object of commiseration.

We finished our breakfast, without either of us having alluded, in the slightest manner, to her trials; but I thought there was a degree of absence and restraint about her, foreign to her former nature, till she observed that my attention was attracted by several little chairs and stools that stood interspersed among the other furniture of the room, when, following the direction of my eye, she said, "they belonged to the children; I keep all their things about me. But come, and I will show you my treasury," she continued, as she rose, and then, stopping for an instant, she said with earnestness, "if you will promise me not to touch any thing." I gave the promise, and followed her along a passage, till, having unlocked the door of a small room, and opened the window-shutter, she directed my attention to seven pins, driven into the wall at a short distance from each other, on each of which hung, covered with dust, and so impaired by time that some of them were dropping to pieces, a full suit of child's clothes.

"These," said she, pointing to them, "are of greater value to me than all besides that the world contains. They are just as they were taken off from my dear ones the last time they wore them; no touch has come upon them since. I have many things that belonged to them, but these are more to me than all the rest, for they have embraced their bodies, and seem part of their mortal remains, that are still suffered to linger with me. I cannot help this feeling, though it might be supposed of little consequence to one who knows that she is always surrounded with their happy spirits; for of this," she said with solemnity, "I have full assurance. Yes," she continued, "they are ever with me." While she said this, an expression perfectly beatific passed over her countenance. After a moment's pause she pointed out the vestments of a little boy. "These belonged," she said, "to my sweet little William, with his blooming cheeks, and laughing eyes, and clustering sunny curls. O he was a joyous child, and, though sudden in passion, one look of love from me brought back the soft tones of his melodious little voice, and the buoyant laugh of happiness, while the big round tear still stood on his cheek. He seemed to me almost as much a cherub then as he is now; he died of croup at three years old. And these," she continued, "were my gentle Mary's, who was the very reverse of her brother in appearance and disposition, for her soft eyes were dark, and full of serious and pensive expression. She never seemed as if intended for this world, but only sent for a time to twine herself around my heart, and depart to become one of my guardian spirits while I am here, and to enhance my happiness hereafter. She was, indeed, a sweet child, that seemed entirely made of love. Her little pleadings were always irresistible, and she was ever listened to as the peace-maker in every childish dispute; for neither old nor young could withstand the witchery of her sweet tongue, or the glance of her

full soft eyes, when, as I think I see her now, she threw back from them her bright brown ringlets, and fixed their loving looks upon you. And to the last look it still was love; for she died with her arms twined round my neck, and her pretty mouth pressed against my cheek as in the act of giving me her last kiss."

My tears fell fast; but, without noticing them, she still proceeded to name in rotation those to whom the clothes had belonged, and to describe their persons, and the varieties of disposition by which they were distinguished, in such graphic language that I seemed, while I stood in that sepulchral room, to become intimately and personally acquainted with each child who had worn the mouldering garments—they seemed almost visibly assembled round me. I remained several days the guest of my friend, glad of an opportunity of observing the effects of so singular, though it appears to me so natural, a belief in this lonely woman. To other mothers bereaved of their children, all is desolate; they look upon the places they were wont to occupy, and mourn. But her bosom was not oppressed by sighs, nor her eyes dimmed by tears, though she every where saw the traces of her beloved ones; for no circumstance had the power, after the lapse of so many years, to obliterate them from her remembrance for a moment. She lived constantly among the happy spirits of her children. Their joyous little faces surrounded her table—they gamboled beside her in her walks—and when awake in the night, she seemed to hear their soft breathings, as she was wont to do in years long gone by, when they peacefully slumbered beside her. To her there was no such thing as solitude; wherever she moved, she was accompanied by this little band of domestic angels, encouraging and beckoning her on to regions of celestial gladness, from which they had returned to point the way, and where her spirit rejoiced that they were safely lodged, for ever freed from sin and care. She lived in an atmosphere of purity, guarded by those holy beings to whose mortal bodies she had given birth; and she awaited her own final departure in perfect peace and tranquillity.

REMARKABLE TRAVELS IN UNCIVILIZED COUNTRIES.

CARVER, IN NORTH AMERICA.

THE accounts brought home by travellers, regarding countries rarely visited and little known, have been always received with much incredulity by those who were little acquainted with the world; and the Persian proverb that "he who has seen the world has a right to tell lies," has been used rather too lavishly in judging of the details of travellers, that were afterwards found to be worthy of far different treatment. "We travellers," says Lady Wortley Montague, "are in very hard circumstances: If we say nothing but what has been said before us, *we are dull, and we have observed nothing.* If we tell any thing new, we are laughed at as *fabulous and romantic,* not allowing either for the difference of ranks, which affords difference of company, or more curiosity, or the change of customs, that happen every twenty years in every country. But the truth is, people judge of travellers exactly with the same candour, good nature, and impartiality, they judge of their neighbours upon all occasions." It is this which has led many men of high honour, who would not submit to have their veracity called in question, to continue entirely silent regarding many remarkable things seen by them in strange countries, and the relation of which would most probably have been received with evident incredulity by the hearers. A Hindoo scarcely thinks it possible that any nation can live without *rice*—a Greenlander thinks the same of *blubber*—a Persian thinks the same of the *date-tree*—an African of the *palm-tree*—a Maldivian of the *cocoa-nut*—an Arab of the *camel*—a Laplander of the *rein-deer*—and a Tartar of the *horse*—whilst the native of Terra del Fuego would be much astonished if he were told that any nation could live without *shell-fish.* It is only by attending to the accounts of respectable travellers regarding foreign countries, that the clouds of vulgar error and prejudice can be removed; and, in this way, it is now firmly believed by all sensible men that there is such a creature as a cameleopard or a kangaroo in the world; and that there are some countries where *oysters,* and *bread,* and *milk,* grow upon trees—all of which would have been set down to the credit of Aboulfouaris, and the Arabian Nights, at no very distant period. Accordingly, by way of fostering this vulgar incredulity, it is more than probable that the first accounts of the Patagonians furnished Swift with a hint for his *giants* in Gulliver's Travels; as the adventures of Baron de Tott, among the Turks, at a much later period, produced the memoirs of the unparalleled Baron Munchausen! Bruce's veracity regarding what he saw in Abyssinia was likewise called in question without ceremony; and it was not till a considerable time after his death, that the character of that high-minded traveller was proven to be without a flaw.

With the view of removing such prejudices as these, which are almost always based on ignorance, we shall, in this and a few succeeding articles, bring forward the accounts given by some travellers of unquestionable authority, of their observations and adventures in uncivilized countries; taking care to select such as appear to be most uncommon, and such as may afford most amusement and instruction to our youthful readers in particular.

What AFRICA was to the ancients in the way of producing novelties, AMERICA has been to the moderns. Utopia, New Atlantis, El Dorado, Fairy Land, and the Painters' Wives' Islands, were all said by the wits of the sixteenth century to be portions of this lately discovered quarter of the globe. "The Painter's Wife's Island," says Dr Huelyn,* "is an island of this tract, mentioned by Sir Walter Raleigh in his *History of the World;* of which he was informed by Don Pedro de Sarmiento, a Spanish gentleman employed by his king in planting some colonies on the Straits of Magellan, who, being taken prisoner by Sir Walter in his going home, was asked of him about some island which the maps presented in those straits, and might have been of great use to him in his undertaking; to which he merrily replied, that it was to be called the *Painter's Wife's Island,* saying, that whilst the painter drew that map, his wife sitting by *desired him to put in one country for her, that she in her imagination might have an island of her own.* His meaning was, that there was no such island as the maps presented. And I fear the painter's wife hath many islands, and some countries too, upon the continent, in our common maps, which are not really to be found on the strictest search." Of such sort, also, are what are called the Lands of Chivalry; of which the Isle of Adamants, in *Sir Huon of Bordeaux;* the Firm Land, in the history of *Amadis de Gaul;* the Hidden Island, and that of the sage *Alart,* in *Sir Palmerin of England;* as also the Island of *Barataria,* of which the famous Sancho Panza was some time governor, and the kingdom of *Micomicona;* "which, as the ingenious author of the History of Don Quixote merrily observeth," says Dr Huelyn, "are not to be found in all the map."

Leaving these to take their place with the *Terra Australis Incognita,* or Southern Continent yet undiscovered, we shall at once introduce our readers to the acquaintance of our friend honest Jonathan Carver, who, in his veritable memoirs, inscribed to Sir Joseph Banks, has given by far the most interesting and rational account of the Red men, the inhabitants of the Western Wilderness, of any traveller with whose works we are acquainted. These original inhabitants of America, it must be observed, have very stupidly, all along from the time of their first discovery in 1492, received from Europeans the denomination of INDIANS, although they never had any thing more to do with the country called *India,* than they had to do with Sancho's island of Barataria, or Gulliver's island of Lilliput. This awkward mistake originated in the mere circumstance of Columbus's being in search of a road to India by the west, when he found his course interrupted by the islands and continent of America; to which was given forthwith the strange denomination of the *West Indies*—thus confounding under one appellation two most important portions of the globe, which were, in fact, as distinct from one another in their entire nature and productions, as they happened to be in their relative geographical positions. Yet such is the inveteracy of popular custom, after it once gets a firm footing in the world, that it would now be impossible to change these denominations; and, therefore, the term *Indian* must henceforth always continue to be the name of every one of the original inhabitants of the whole continent and islands of America.

The different tribes of Indians, or original natives, in that extensive portion of North America called Canada, were at one time almost innumerable; but they have been observed to decrease in population where the Europeans are most numerous, owing chiefly to their immoderate use of spirituous liquors. Ardent spirits, the most fatal present the old world ever made to the new, was no sooner known to the Indian tribes, than they grew passionately fond of it. It was equally impossible for them to abstain from it, or to use it with moderation. It was soon observed that this liquor disturbed their domestic peace, deprived them of their judgment, made them furious; that it occasioned husbands, wives, children, brothers and sisters, to abuse and quarrel with one another. In vain did some sober Frenchmen expostulate with them, and endeavour to shame them out of these excesses. "It is you," answered they, "who have taught us to drink this liquor; and now we cannot do without it. If you refuse to give it us, we will go and get it of the English. It is you who have done the mischief, and it cannot be repaired."

Canada was first discovered in 1497, by John and Sebastian Cabot of Bristol, and it was settled by the French in 1608. It was conquered by the English in 1759, and confirmed to them by the French at the peace of 1763; at which time the narrative of the travels of our present author, Captain Jonathan Carver, commences. "No sooner," says he, "was the late war with France concluded, and peace established by the treaty of Versailles, in the year 1763, than I began to consider (having rendered my country some services during the war) how I might continue still serviceable, and contribute, as much as lay in my power, to make that vast acquisition of territory, gained by Great Britain in North America, advantageous to it. It appeared to me indispensably needful that government should be acquainted, in the first place, with the true state of the dominions they were now become possessed of. To this purpose I determined, as the next proof of my zeal, to explore the most unknown parts of them, and to spare no trouble or expense in acquiring a knowledge that promised to be so useful to my countrymen."*

With the laudable design of accomplishing these objects, Captain Carver set out from Boston, in June 1766, with the full intention of penetrating to the Pacific Ocean on the west. He proceeded by way of Albany and Niagara to Michillimackinac, a fort situated between the lakes Huron and Michigan, and distant from Boston 1300 miles. "This," says he, "being the uttermost of our factories towards the north-west, I considered it as the most convenient place from whence I could begin my intended progress, and enter at once into the regions I designed to explore."

At the entrance of a bay, about ninety miles long, called Green Bay, on the north-western extremity of lake Michigan, are situated a string of islands described by our author under the name of the Grand Traverse. On one of these occurred his first meeting with one of the tribes of the Red men, the primitive hunters of the west; and he gives the following interesting description of the reception he met with from the Indians:—"On the largest and best of these islands stands a town of the Ottawaws, at which I found one of the most considerable chiefs of that nation, who received me with every honour he could possibly show to a stranger. But what appeared extremely singular to me at the time, and must do so to every person unacquainted with the customs of the Indians, was the reception I met with on landing. As our canoes approached the shore, and had reached within about threescore rods of it, the Indians began a *feu-de-joie,* in which they fired their pieces loaded with balls, but at the same time they took care to discharge them in such a manner as to fly a few yards above our heads: during this they ran from one tree, or stump, to another, shouting and behaving as if they were in the heat of battle. At first I was greatly surprised, and was on the point of ordering my attendants to return their fire, concluding that their intentions were hostile; but being undeceived by some of the traders, who informed me that this was the usual method of receiving the chiefs of other nations, I considered it in its true light, and was pleased with the respect thus paid me.

"I remained here one night. Among the presents I made the chiefs were some spirituous liquors, with which they made themselves merry; and all joined in a dance that lasted the greatest part of the night. In the morning when I departed, the chief attended me to the shore; and as soon as I had embarked, offered up, in an audible voice, and with great solemnity, a fervent prayer in my behalf. He prayed 'that the Great Spirit would favour me with a prosperous voyage; that he would give me an unclouded sky, and smooth waters by day; and that I might lie down by night on a beaver blanket, enjoying uninterrupted sleep and pleasant dreams; and also that I might find continual protection under the great pipe of peace.' In this manner he continued his petitions till I could no longer hear them.

"I must here observe, that, notwithstanding the inhabitants of Europe are apt to entertain horrid ideas of the ferocity of these savages, as they are termed, I received from every tribe of them in the interior parts the most hospitable and courteous treatment; and am convinced, that, till they are contaminated by the example and spirituous liquors of their more refined neighbours, they retain this friendly and inoffensive conduct towards strangers. Their inveteracy and cruelty to their enemies I acknowledge to be a great abatement of the favourable opinion I would wish to entertain of them; but this failing is hereditary, and, having received the sanction of immemorial custom, has taken too deep root in their minds to be easily extirpated.

"Among these people I ate of a very uncommon kind of bread. The Indians in general use but little of this nutritious food. Whilst their corn is in the milk, as they term it, that is, just before it begins to ripen, they slice off the kernels from the cob to which they grow, and knead them into a paste. This they are enabled to do without the addition of any liquid, by the milk that flows from them; and when it is effected, they parcel it out into cakes, and, enclosing them in leaves of the basswood tree, place them in hot embers, where they are soon baked. And better flavoured bread I never ate in any country."

Notwithstanding the primitive simplicity of these wanderers of the wilderness, and their friendly and inoffensive conduct towards strangers, yet, from the remains of a regular *fortification* which Captain Carver saw, or at least thinks he saw, amidst the prairies of the Mississippi, it would appear that in former ages there must have been a population of remarkably scientific warriors *located* in this quarter. The following is our author's account of this important discovery:—"One day having landed on the shore of

* Vide Cosmography, vol. ii. p 1132.

* *Vide* Three Years' Travels through the interior parts of North America, for more than five thousand miles. By Captain Jonathan Carver, of the provincial troops in America. Edinburgh, 1798.

the Mississippi, some miles below lake Pepin, whilst my attendants were preparing my dinner, I walked out to take a view of the adjacent country. I had not proceeded far before I came to a fine, level, open plain, on which I perceived at a little distance a partial elevation, that had the appearance of an intrenchment. On a nearer inspection, I had greater reason to suppose that it had really been intended for this many centuries ago. Notwithstanding it was now covered with grass, I could plainly discern that it had once been a breast-work of about four feet in height, extending the best part of a mile, and sufficiently capacious to cover five thousand men. Its form was somewhat circular, and its flanks reached to the river. Though much defaced by time, every angle was distinguishable, and appeared as regular, and fashioned with as much military skill, as if planned by Vauban himself. The ditch was not visible, but I thought, on examining more curiously, that I could perceive there certainly had been one. From its situation, also, I am convinced that it must have been designed for this purpose. It fronted the country, and the rear was covered by the river; nor was there any rising ground for a considerable way that commanded it; a few straggling oaks were alone to be seen near it. In many places small tracks were worn across it by the feet of the elks and deer, and, from the depth of the bed of earth by which it was covered, I was able to draw certain conclusions of its great antiquity. I examined all the angles and every part with great attention, and have often blamed myself since for not encamping on the spot, and drawing an exact plan of it. To show that this description is not the offspring of a heated imagination, or the chimerical tale of a mistaken traveller, I find on inquiry, since my return, that Mons. St Pierre and several traders have at different times taken notice of similar appearances, on which they have formed the same conjectures, but without examining them so minutely as I did. How a work of this kind could exist in a country that has hitherto (according to the general received opinion) been the seat of war to untutored Indians alone, whose whole stock of military knowledge has only, till within two centuries, amounted to drawing the bow, and whose only breast-work, even at present, is the thicket, I know not. I have given as exact an account as possible of this singular appearance, and I leave to future explorers of these distant regions, to discover whether it is a production of nature or art."

We must confess that our philosophy is completely at fault here, and all the antiquarian lore of which we are possessed will not enable us to solve this difficult problem. It is a pity that the redoubted Edie Ochiltree is now no more, as, perhaps, he might have been able to clear up the mystery of this matter, in as easy a way as he did that of Monkbarns's celebrated entrenchment.

The farthest point of Captain Carver's peregrination to the north-west was at the river St Francis, about sixty miles beyond the Falls of St Anthony on the Mississippi, which are situated in lat. 46° N., long. 95° W. from London, and at the distance of nearly 2000 miles from the mouth of the Mississippi. These falls, which, till of late, formed the farthest limit to which Europeans had penetrated into the wilderness in that direction, received their name from Father Louis Hennepin, a French missionary, who travelled into these parts about the year 1680, and was the first European ever seen by the natives. The body of waters which forms the fall is above 250 yards in breadth, producing a most beautiful cataract; it falls perpendicularly about thirty feet, and the rapids below, in the space of 300 yards more, render the descent considerably greater, so that, when viewed at a distance, the falls appear to be much higher than they really are. The country around them is extremely beautiful. It is not an uninterrupted plain, where the eye finds no relief, but it is composed of many gentle ascents, which, in the summer, are covered with the finest verdure, and interspersed with little groves, that give a charming variety to the prospect. "On the whole," says our traveller, "when the falls are included, which may be seen at the distance of four miles, a more pleasing and picturesque view cannot, I believe, be found throughout the universe."

The following description, given by Carver, of the behaviour of a young Indian prince, who went in company with him to view this celebrated place for the first time, presents a most interesting picture of the power which the natural sublime and beautiful are capable of exercising over the human mind in its unsophisticated state:—"We could distinctly hear the noise of the water full fifteen miles before we reached the falls; and I was greatly pleased and surprised when I approached this astonishing work of nature; but I was not long at liberty to indulge these emotions, my attention being called off by the behaviour of my companion.

"The prince had no sooner gained the point that overlooks this wonderful cascade, than he began with an audible voice to address the Great Spirit, one of whose places of residence he imagined this to be. He told him that he had come a long way to pay his adorations to him, and now would make him the best offering in his power. He accordingly first threw his pipe into the stream; then the roll that contained his tobacco; after these, the bracelets he wore on his arms and wrists; next, an ornament that encircled his neck, composed of beads and wires; and, at last, the ear-rings from his ears; in short, he presented to his god every part of his dress that was valuable. During this, he frequently smote his breast with great violence, threw his arms about, and appeared to be much agitated.

"All this while he continued his adorations, and at length concluded them with fervent petitions, that the Great Spirit would constantly afford us his protection on our travels, giving us a bright sun, a blue sky, and clear and untroubled waters: nor would he leave the place till we had smoked together with my pipe, in honour of the Great Spirit.

"I was greatly surprised at beholding an instance of such elevated devotion in so young an Indian; and instead of ridiculing the ceremonies attending it, as I observed my Catholic servant tacitly did, I looked on the prince with a greater degree of respect for these sincere proofs he gave of his piety; and I doubt not but that his offerings and prayers were as acceptable to the universal Parent of mankind, as if they had been made with greater pomp, or in a consecrated place."

AN AMERICAN ORIGINAL.

[By Audubon.]

As I was lounging one fair and very warm morning on the *Levee* at New Orleans, I chanced to observe a gentleman, whose dress and other accompaniments greatly attracted my attention. I wheeled about, and followed him for a short space, when, judging by every thing about him that he was a true original, I accosted him.

But here, kind reader, let me give you some idea of his exterior. His head was covered by a straw hat, the brim of which might cope with those worn by the fair sex in 1830; his neck was exposed to the weather; the broad frill of a shirt, then fashionable, flapped about his breast, whilst an extraordinary collar, carefully arranged, fell over the top of his coat. The latter was of a light green colour, harmonizing well with a pair of flowing yellow nankeen trousers, and a pink waistcoat, from the bosom of which, amidst a large bunch of the splendid flowers of the magnolia, protruded part of a young alligator, which seemed more anxious to glide through the muddy waters of some retired swamp than to spend its life swinging to and fro among folds of the finest lawn. The gentleman held in one hand a cage full of richly-plumed nonpareils, whilst in the other he sported a silk umbrella, on which I could plainly read, "*Stolen from I,*" these words being painted in large white characters. He walked as if conscious of his own importance, that is, with a good deal of pomposity, singing, "My love is but a lassie yet," and that with such thorough imitation of the Scotch emphasis, that, had not his physiognomy brought to my mind a denial of his being from "within a mile of Edinburgh," I should have put him down in my journal for a true Scot. But no. His tournure, nay, the very shape of his visage, pronounced him an American, from the farthest parts of our eastern Atlantic shores.

All this raised my curiosity to such a height, that I accosted him with, "Pray, sir, will you allow me to examine the birds you have in that cage?" The gentleman stopped, straightened his body, almost closed his left eye, then spread his legs apart, and, with a look altogether quizzical, answered, "Birds, sir, did you say birds?" I nodded, and he continued, "What the devil do you know about birds, sir?"

Reader, this answer brought a blush into my face. I felt as if caught in a trap, for I was struck by the force of the gentleman's question: which, by the way, was not much in discordance with a not unusual mode of granting an answer in the United States. Sure enough, thought I, little or perhaps nothing do I know of the nature of those beautiful denizens of the air, but the next moment vanity gave me a pinch, and urged me to conceive that I knew at least as much about birds as the august personage in my presence. "Sir," replied I, "I am a student of nature, and admire her works, from the noblest figure of man to the crawling reptile which you have in your bosom." "Ah!" replied he, "a-a-a naturalist, I presume?" "Just so, my good sir," was my answer. The gentleman gave me the cage; and I observed from the corner of one of my eyes that his were cunningly inspecting my face. I examined the pretty finches as long as I wished, returned the cage, made a low bow, and was about to proceed on my walk, when this odd sort of being asked me a question quite accordant with my desire of knowing more of him: "Will you come with me, Sir? If you will, you shall see some more curious birds, some of which are from different parts of the world. I keep quite a collection." I assured him I should feel gratified, and accompanied him to his lodgings.

We entered a long room, where, to my surprise, the first objects that attracted my attention were a large easel, with a full-length unfinished portrait upon it, a table with pallets and pencils, and a number of pictures of various sizes placed along the walls. Several cages containing birds were hung near the windows, and two young gentlemen were busily engaged in copying some finished portraits. I was delighted with all I saw. Each picture spoke for itself: the drawing, the colouring, the handling, the composition, and the keeping—all proved, that, whoever was the artist, he certainly was possessed of superior talents.

I did not know if my companion was the painter of the picture, but, as we say in America, I strongly guessed, and without waiting any longer, paid him the compliments which I thought he fairly deserved. "Ay," said he, "the world is pleased with my work; I wish I were so too; but time and industry are required, as well as talents, to make a good artist. If you will examine the birds, I'll to my labour." So saying, the artist took up his pallet, and was searching for a rest-stick, but not finding the one with which he usually supported his hand, he drew the rod of a gun, and was about to sit, when he suddenly threw down his implements on the table, and, taking the gun, walked to me, and asked if "I had ever seen a percussion-lock." I had not, for that improvement was not yet in vogue. He not only explained the superiority of the lock in question, but undertook to prove that it was capable of acting effectually under water. The bell was rung, a flat basin of water was produced, the gun was charged with powder, and the lock fairly immersed. The report terrified the birds, causing them to beat against the gilded walls of their prisons. I remarked this to the artist. He replied, "The devil take the birds—more of them in the market; why, sir, I wish to show you that I am a marksman as well as a painter." The easel was cleared of the large picture, rolled to the farther end of the room, and placed against the wall. The gun was loaded in a trice, and the painter, counting ten steps from the easel, and taking aim at the supporting-pin on the left, fired. The bullet struck the head of the wooden pin fairly, and sent the splinters in all directions. "A bad shot, sir," said this extraordinary person; the ball ought to have driven the pin farther into the hole, but it struck on one side; I'll try at the hole itself." After reloading his piece, the artist took aim again, and fired. The bullet this time had accomplished its object, for it had passed through the aperture, and hit the wall behind. "Mr ——, ring the bell and close the windows," said the painter, and turning to me, continued—"Sir, I will show you the *ne plus ultra* of shooting." I was quite amazed, and yet so delighted, that I bowed my assent. A servant having appeared, a lighted candle was ordered. When it arrived, the artist placed it in a proper position, and retiring some yards, put out the light with a bullet, in the manner which I have elsewhere in this volume described. When light was restored, I observed the uneasiness of the poor little alligator, as it strove to effect its escape from the artist's waistcoat. I mentioned this to him. "True, true," he replied, "I had quite forgot the reptile; he shall have a dram;" and unbuttoning his vest, unclasped a small chain, and placed the alligator in the basin of water on the table.

Perfectly satisfied with the acquaintance which I had formed with this renowned artist, I wished to withdraw, fearing I might inconvenience him by my presence. But my time was not yet come. He bade me sit down, and paying no more attention to the young pupils in the room than if they had been a couple of cabbages, said, "If you have leisure, and will stay a while, I will show you how I paint, and will relate to you an incident of my life, which will prove to you how sadly situated an artist is at times." In full expectation that more eccentricities were to be witnessed, or that the story would prove a valuable one even to a naturalist, who is seldom a painter, I seated myself at his side, and observed with interest how adroitly he transferred the colours from his glistening pallet to the canvas before him. I was about to compliment him on his facility of touch, when he spoke as follows:—

"This is, sir, or, I ought to say rather, this will be, the portrait of one of our best navy officers, a man as brave as Cæsar, and as good a sailor as ever walked the deck of a seventy-four. Do you paint, sir?" I replied "Not yet." "Not yet! what do you mean?" "I mean what I say: I intend to paint as soon as I can draw better than I do at present." "Good," said he; "you are quite right; to draw is the first object; but, sir, if you should ever paint, and paint portraits, you will often meet with difficulties. For instance, the brave commodore, of whom this is the portrait, although an excellent man at every thing else, is the worst sitter I ever saw; and the incident I promised to relate to you, as one curious enough, is connected with his bad mode of sitting. Sir, I forgot to ask if you would take any refreshment—a glass of wine, or ——." I assured him I needed nothing more than his agreeable company, and he proceeded. "Well, sir, the first morning that the commodore came to sit, he was in full uniform, and with his sword at his side. After a few moments of conversation, and when all was ready on my part, I bade him ascend this *throne*, place himself in the attitude which I contemplated, and assume an air becoming an officer of the navy." He mounted, placed himself as I had desired, but merely looked at me as if I had been a block of stone. I waited a few minutes, when, observing no change on his placid countenance, I ran the chalk over the canvass, to form a rough outline. This done, I looked up to his face again, and opened a conversation which I thought would warm his warlike nature; but in vain. I waited and waited, talked and talked, until my patience—sir, you must know I am not overburdened with phlegm—being almost run out, I rose, threw my pallet and brushes on the floor, stamped, walking to and fro about the room, and vociferated such calumnies against our navy, that I startled the good commodore. He still looked at me with a placid countenance, and, as he has told me

since, thought I had lost my senses. But I observed him all the while, and, fully as determined to carry my point as he would be to carry off an enemy's ship, I gave my oaths additional emphasis, addressed him as a representative of the navy, and, steering somewhat clear of personal insult, played off my batteries against the craft. The commodore walked up to me, placed his hand on the hilt of his sword, and told me, in a resolute manner, that if I intended to insult the navy, he would instantly cut off my ears. His features exhibited all the spirit and animation of his noble nature, and as I had now succeeded in rousing the lion, I judged it time to retreat. So, changing my tone, I begged his pardon, and told him he now looked precisely as I wished to represent him. He laughed, and, returning to his seat, assumed a bold countenance. And now, sir, see the picture."

At some future period I may present you with other instances of the odd ways in which this admired artist gave animation to his sitters. For the present, kind reader, we shall leave him finishing the commodore, while we return to our proper studies.—*American Ornithology.*

ALBANIA AND ALI PACHA

[From an excellent work recently published, entitled, "Sketches in Greece and Turkey."]

EARLY in the spring of 1832, I visited, with one companion, the bleak and mountainous country on the eastern shore of the Adriatic Gulf, now known by the name of Albania. The wild and half savage character of its inhabitants—the dark and ferocious reputation of its late celebrated pacha—and perhaps still more, the description of its scenes which adorns the pages of "Childe Harold," combine to make this peculiar country one of the most interesting and romantic in Europe. We approached it from the Ionian Isles, on an evening most congenial to its cold and desolate character. The pestilential sirocco was blowing with great violence; and we sat on deck some hours after nightfall, watching the dark tempest as it slowly gathered on the snowy peaks of Chimari, and enjoying the bright flashes, as in quick succession they shot downwards to the shore, and the sublimity of the thunder, as it rolled in the distant gloom of the mountains.

The traveller who visits Albania must be satisfied with and thankful for whatever accommodations it may please Providence to provide him withal, and must not grumble even if occasionally he should find none at all. The first evening on our landing, we were hospitably received by some Albanians who farmed a little isolated custom-house on the shore; they assigned us our share of a small room or loft above the stable, and showed us every attention in their power. Being the first of their nation we had seen, their wild but eminently handsome countenances—their long black hair flowing down their shoulders—their large, shaggy, white capote—their voluminous kilts, or *fustinelle*, of white linen, reaching to the knees—their broad girdle, containing dagger, pistols, ramrod, and inkstand (which last must have been surprised to find itself in such company)—and the *ensemble* of their costume and appearance, afforded us much matter for interesting observation. They seemed to take equal pleasure in examining our persons and accoutrements; and after we had mutually gratified our curiosity, we spread our mattrasses in a corner, and lay down to sleep. Five of these savages slumbered around us, though the room was somewhat diminutive for so large a number; and a lamp was left faintly burning on the table. The wind entered our dormitory between every board of the floor, and almost every stone in the wall; the horses and mules kept up an incessant kicking and squealing below us; the moon intruded her rays through the broken tiles, which were substituted for a real roof; and when day appeared, the light broke in upon us (to use an expression of Mr Burke's) "not through well-contrived apertures and windows, but through gaps and chinks—through the yawning chasms of our ruin."

The following morning we pursued our journey to Janina, the capital, through a number of mountain passes, all of which were striking, and one of them singularly beautiful. The Albanese villages, of which we passed several, are for the most part picturesque, and even elegant, though not generally clean. The cottages, often extremely miserable, are not built in rows, but grouped at some distance from each other, with trees and greensward in the intervals; a plan which gives at a distance an interesting appearance even to the meanest hamlets. Those of the Albanese who do not live in villages, and who are more peculiarly shepherds and mountaineers, make themselves small hovels of straw in the form of tents, and generally about four or five feet high, which cost them nothing either to construct or to abandon when circumstances induce them to change their habitation.

The different tribes of the Albanians vary in the minor features of their character, but the general outlines are in all nearly the same. They are violent, ferocious, and turbulent; attached to predatory habits, and cursed with an insatiable passion for gold. They seem to have little or no religion, but are kind to strangers, and remarkable for the savage virtue of hospitality. The Turks and Greeks of these parts hold them in equal dread and abhorrence; and certainly their conduct since the days of Ali Pacha has been such as amply to justify both these sentiments. Personally, we found little reason to complain; but the character of a people must not be taken from the experience of a passing guest.

The second evening of our stay in Albania we rested at a wretchedly filthy and desolate *khan* among the mountains, where half a dozen natives had already taken up their quarters. We arranged our rude couches as well as we could, and amused ourselves with contemplating the wild scene before us. Ten of these fellows, all in full national costume, were squatting cross-legged round an immense fire, the smoke from which (as, of course, there was no chimney) curled in large volumes round the roof, in search of a legitimate exit. As the flame rose and fell, the red light glared fitfully across their savage features; and one of them roared out, for nearly an hour together, in a disagreeable nasal tone, one of their wild mountain songs, applying from time to time to the wine jug, which passed in rapid succession from hand to hand. I never saw a more characteristic or extraordinary scene. It was little different from that described in Childe Harold, cant. ii. st. 71.

We approached Janina in the evening. The rays of the setting sun gave a somewhat warmer tint to the snows of the mighty Pindus, and glimmered faintly along the still surface of the lake. This once celebrated city stands partly on the mainland, and partly on a promontory which projects into the lake, and contains the fortress. The minarets of twelve mosques enliven the scene, and form an agreeable contrast with the dark foliage of the cypresses which grow beside them. The scene at a distance is interesting and attractive, but the illusion vanishes as you approach. Two thousand houses of the most miserable construction, and a heap of ruins, are all that now remain of the seat of a powerful and wealthy government, which for a time was a rival to the Porte itself. The fort still exists, though in a ruinous condition; but the magnificent palaces of Ali and his two sons are a mere undistinguished mass of rubbish, and nearly three-fourths of the town are utterly swept away. The chief injury was committed at the time of Ali Pacha's assassination, in consequence of his obstinate resistance; but since his death, a period of eleven years, the city has been five times plundered by the Albanese, under the feeble sway of two successive pachas. The last time was in the autumn of 1830. In consequence of these repeated visitations, the city has lost all individual attraction; and it is now only interesting as having been the scene where, for many years, an extraordinary man exercised a barbarous but salutary dominion, and at length met with a tragical termination to his dark career.

The early part of Ali Pacha's history and government; the security of property which was afforded, and the excellent order which was established in every part of his jurisdiction; his avarice, ambition, and cunning; and the barbarous system which he pursued in order to augment and consolidate his power, and keep in check his wild and rebellious subjects, are already known to the public through the narratives of Dr Holland, Mr Hobhouse, and M. Pouqueville. In the latter years of his life, avarice and cruelty became his predominant passions, and increased to so inordinate a degree as to overpower his natural shrewdness and discernment, and altogether alienate the affections of his Albanese followers, who, as long as he had paid them liberally, were ardently devoted to his service, but whose fidelity was not proof against a diminution in the scale of their rewards. In the year 1820, the Porte, after being foiled in several attempts to release itself from this too powerful servant, set a price upon his head, and sent Reschid Pacha with a large army to take it. Janina was besieged, and reduced to great extremities. However, Ali's immense wealth, the fruit of half a century of rapacity, still afforded him great resources; and if he could only have resolved to distribute it with liberality, he might even then have turned away his fate. As it was, the siege was prolonged for several months, till at length the Albanians, disgusted with the increasing avarice of their master, deserted in great numbers. Ali then retired to a small fort which he had built on an island in the lake, leaving a faithful slave, with a loaded pistol and several barrels of gunpowder, in the cellars of his palace, where his treasures were concealed, with orders to blow up the building if he did not receive every day, at a certain hour, a written message from him to the contrary.

While on the island, Reschid Pacha continued to persuade the old rebel that he was his friend, and wished him well, and might perhaps be able, in case of immediate submission, to procure his pardon from the Porte. They had several interviews; and in the last of these, as Ali had accompanied his visitor to the door of the apartment, and was politely bowing him away, Reschid Pacha drew a pistol, and wounded Ali in the arm. Ali instantly drew his sabre, and made a cut at his assassin; but the weapon caught in the top of the door, and Reschid escaped. The unfortunate Pacha then shut the door, and retired to the divan, writhing with pain from his wound. He saw his hour was come, and, turning to Captain D'Anglos, an Englishman, who had been with him for some time, and was present at the scene, he requested him most earnestly to poison Vasilika, his favourite wife, that she might not fall into the hands of the enemy; and at the same time gave him his large diamond, said to be worth L.30,000, and desired him to pound it to pieces in his presence. Captain D'Anglos took the diamond, and, in the simplicity of his heart, began to pound away with great zeal and vigour; and it was not, he declared, till the gem was utterly destroyed, that he was struck with the idea how far more sensible it would have been to have put it into his waistcoat pocket, when there was no one near to see or to prevent him, and when Ali was lying on the divan almost insensible with pain.* He had not been long in this situation, when a shot which came through the floor below struck him in a vital part, and his assassins entering the room, cut off his head, and sent it, as is customary, to Constantinople. Ali's two sons, Muchtar and Veli, were soon after invited to Berat by Reschid Pacha, and there treacherously murdered. Vasilika his wife still survives; we saw her at Janina, as she was walking out to visit a friend.

Ali was certainly one of the most remarkable characters which have appeared in the present century. From a mere mountain robber, without money, influence, or friends, he raised himself to be absolute ruler of a large district, and, at the same time, elevated his province to an important political station among the secondary powers of Europe. By his shrewd intellect, and his vigorous and severe method of government, he established security and order through extensive dominions, which, both before and since, have been one incessant scene of anarchy and misrule. But his character was stained by two of the darkest vices which disgrace humanity. His avarice and cruelty brought about his ruin. He had collected enormous treasures, but he was too miserly to spend them, even when it became necessary for his own safety. His cruelty alienated the hearts of his most faithful followers, but for a time fear supplied the place of attachment. The number of persons he put to death judicially and publicly, is said to have been unexampled in the annals of any former vizier; and, as we were assured by those who had watched his whole career, even these were far exceeded by the victims whom he had secretly drowned in the lake, which, by all accounts, must be actually paved with carcasses. There is a small chasm or fissure in the island of which I have already spoken, which communicates with the lake. Of this Ali made frequent use. His victims were enticed to the spot, and then precipitated into the cave, where a boat was in waiting to convey them to the deepest part of the water. This cavern was the scene of a tragical story which is still current in Janina. Muchtar's wife complained to her father-in-law of her husband's infidelity, and pointed out eleven of the most beautiful women in the city as accomplices in his guilt. They were all seized the same night, and drowned near this cavern, according to the Turkish custom in such cases. These unfortunate victims belonged to some of the first families in Janina. These individual murders, and one or two massacres on a larger scale, have stamped the name of Ali with a character of ferocity, which, even in Turkey, is thought of with abhorrence.

IRON STEAM-BOATS.

VESSELS constructed of sheet-iron have been sometimes tried in this country, but it does not appear that any essential advantage was gained by the change, as the use of metal for wood has never extended beyond the first experiments, except for track-boats on canals, where the lightness of the structure seems to have recommended its adoption in some cases. In warm climates, however, the case is different; the superiority of iron over wood is there evinced in many essential circumstances, and it is so decided, that, in the course of time, it must cause a total revolution in ship-building for these countries. The great changes, from excessive drought to heavy rains, which take place in hot climates, have a powerful effect in destroying the joinings and frame-work of the best built ships, as well as in wasting their timber. Sometimes, during wet seasons, the rains pour down for days together, till the whole decks and frame of the vessel are soaked with moisture; the sun immediately after breaks out with a strong cloudless heat, and the planks, which had been swelled with wet, now shrink from the penetrating drought, till their joints separate from each other, and leave large gaps and seams. During the next heavy shower, perhaps, these give free entrance to rain, and the cabins below are frequently deluged, in such cases, like an open shed. This takes place particularly on the coast of Guinea, but it is felt to a painful extent by all coasting vessels in tropical climates. This, however, is not the only inconvenience: wood, it is well known, is a bad conductor of heat, so that whatever warmth is generated within a wooden vessel, is likely to remain there, and even to increase, within certain limits, so long as the cause continues to operate. The breath of the sailors, therefore, when they sleep below decks, and the heat communicated through the planks by the vertical sun, frequently make the hold of a ship in warm climates so insufferably hot, that it is almost suffocation to remain in it; and though there are contrivances (called windsails) which are used to send down a current of cool air, the heat and effluvia are still injurious to health. The same warmth, however, which is hurtful to mankind, makes the hold of these vessels a favourite shelter for all the noxious vermin of hot climates: scorpions, centipedes, rats, cockroaches, and all abominations, delight in their recesses. Henry Martin, a well-

* The unlucky captain was so overwhelmed with a sense of shame at his want of *savoir-faire*, that, as he subsequently avowed, the diamond haunted him in his dreams for months after.

known and benevolent chaplain of the East India Company, who made a short passage in one of the native vessels, could compare it to nothing, on this account, but a sepulchre, full of every thing unclean and poisonous. The unpacking of boxes which have been any time on board of such craft is sometimes a work of great danger, and a person has to stand by with a sharp instrument to prick the scorpions to death. The vermin are sometimes killed by introducing a tube from a steam-boiler, and filling the hold (which is well closed down in the meantime) with hot steam; this kills them, and boils them down to a pulp; but the vessel requires much cleaning afterwards. The chief cause of the preference shown by such vermin to the holds of ships, is the heat generated in the confined atmosphere, which the non-conducting properties of their wooden sides do not allow to escape. All this would be avoided by having vessels constructed of iron; that metal is so complete a conductor, that the heat generated within the hold would be transmitted instantly through the sides of the ship, and abstracted by the cool sea water; so that the interior air of the vessel, instead of being kept at a suffocating heat, would never become warmer than the surrounding water. This result is not matter of conjecture or speculation; the experiment has been tried in steam-vessels on the Ganges, and found to answer perfectly; and it is also now under trial in the case of the steam-boat which went out with Mr Lander to explore the river Niger, and its eastern tributary, the Quorra. Accounts have been received from this interesting expedition, which dwell particularly on the advantages derived from the coolness of their metal steam-vessel, and its capability of resisting the effects of a tropical climate. Indeed, had it not been for this invention, it seems likely that the heat generated by steam-engines would have been a powerful bar to the employment of that power in warm climates, at least in vessels coasting along the hot sultry shores and rivers, where the health of European seamen already suffers sufficiently from the temperature. It is singular to consider how science enables mankind to defy the extremes both of heat and cold, and to carry on their enterprises in safety, under the pole or the equator. When our ships were sent to make discoveries near the pole, they were lined with non-conductors, cork and double planking, in order to preserve within them all the heat that was generated either by the people or by the necessary fires; while, under the equator, on the other hand, where the heat is in excess, ships are made entirely of a conducting substance, in order to carry away the heat as fast as it is generated.

OXFORD FLYING COACH.

The following extract is from Antony Wood's Life, written by himself, and is curious in many respects. It may be remarked, that Oxford is about forty-seven miles west from London.—"Monday, 26th April 1669, was the first day that the flying coach went from Oxford to London in one day. A. W—— went in the same coach, having then a boot on each side. Among the six men that went, Mr Richard Holloway, a counsellor of Oxford (afterwards a judge), was one. They then (according to the vice-chancellor's order, stuck up in all public places) entered into the coach at the tavern door, against All Souls College, precisely at six of the clock in the morning, and at seven at night they were all set down at their inn at London." This journey was then accomplished in thirteen hours, and was esteemed, if not a great, a considerable effort. The same journey is now performed in less than half the time.

MARBLE CURIOUSLY STAINED.

In the Bodlevan Library are shown some specimens of marble representing landscapes and various figures. They are by many considered as *lusus naturæ*; but, in fact, they are nothing more than pieces of stained marble. This art was exercised in the seventeenth century by a Mr Bird, a stone-cutter in Oxford. Several were shown to Charles the Second soon after the restoration. They were broken in his presence, and found to correspond through the whole substance. Mr Wood's words are, "William Bird, of Hallywell, in the suburbs of Oxford, stone-cutter, did, in the latter end of this year (1657), find out the painting or staining of marble, a specimen of which he presented to the king after his restoration, as also to the queen, and, in 1669, to Cosmo Prince of Tuscany, when in Oxford."

SPICES.

In the rolls, or accounts of some ancient religious foundations, we frequently find a sum of money charged for spices used in their entertainments; for in those days *spiced wine* was a very fashionable beverage. It appears from a passage in Froissart, that the spice for this mixture was served often separately, in what they called a spice-plate. In the account of Maxtoke Priory, in the year 1447, we have the following curious entry in Latin, of which this is a translation:—'Paid for cretic wine (cretic wine is supposed to be raisin wine, or wine made of dried grapes), with comfits and spices, when Sir S. Montford's fool was here, and exhibited his merriments in the oriel chamber." An oriel was a recess in a chamber or hall, formed by the projection of a spacious bow window from top to bottom.

TABARD.

Stowe, in his survey of London, speaking of the inns in Southwark, says, "Amongst the which innes, the most ancient is the Tabard, so called of the sign, which, as we now term it, is of a jacket or sleeveless coat, whole before, open on both sides, with a square collar winged at the shoulders; a stately garment of old time, commonly worn by noblemen and others, both at home and abroad in the wars; but, then, to wit, in the wars their arms were embroidered, or otherwise depict upon them, that every man by his coat of arms might be known from others: but now these tabards are only worn by the heralds, and are called their coats of arms in service. For the Inn of the Tabard, the poet Chaucer, in the reign of Edward the Third, writeth thus—

> 'It befell, in that season, on a day,
> In Southwarke, at the Tabert as I lay,
> Ready to wend on my pilgrimage
> To Canterbury, with full devout courage.'

Within this inn was also the lodging of the abbot of Hide (by the city of Winchester), a fair house for him and his train when he came to the city to Parliament." The name of the Tabard Inn is now corrupted into Talbot.

CRANMER, RIDLEY, AND LATIMER.

Though these three eminent men were placed in separate lodgings, yet they were suffered sometimes to eat together in the prison of Bocardo. A book of their diet every dinner and supper is still preserved. The following is an extract from it:—

The first of October dinner

Bread and ale . . .	iid.
Item, oysters . . .	id.
Item, butter . . .	iid.
Item, eggs	iid.
Item, ling . . .	viiid.
Item, a piece of fresh salmon	xd.
Wine	iiid.
Cheese and pears . .	iid.

From this book of their expenses, these few observations may be made:—They ate constantly suppers as well as dinners. Their meals amounted to about three or four shillings, seldom exceeding four. Their bread and ale commonly came to twopence or threepence. They had constantly cheese and pears for their last dish, both at dinner and supper, and always wine, the price whereof was ever threepence, and no more. The prices of their provisions (it being now an extraordinary time) were as follow:—A goose, 14d.; a pig, 12d. or 13d.; a cony, 6d.; a woodcock, 3d., and sometimes 5d.; a couple of chickens, 6d.; three plovers, 10d.; half-a-dozen larks, 3d.; a dozen of larks and two plovers, 10d.; a breast of veal, 11d.; a shoulder of mutton, 10d.; roast beef, 12d. From this brief specimen the price of provisions in England about the middle of the sixteenth century may be learned.

RICHARD HAYDOCK, WHO PRETENDED TO PREACH IN HIS SLEEP.

The following extraordinary instance of cunning, combined with hypocrisy, is taken from Stow's Chronicle, continued by How, for the year 1605:—

Richard Haydock, a professed physician, pretended to preach in his sleep; and having an imperfection in his usual or daily speech, yet by his nightly practice in his private chamber, he attained a very good delivery of his mind, and carried himself so cunningly, that he would often seem in his private chamber to preach in his sleep: and being divers times heard by such as were near him, who, though they called or spake unto him never so oft or earnestly, yea, though they stirred or pulled him by the hands and feet, &c., yet would he make no manner of answer at all, but persist smoothly on, keeping his countenance; whereupon his fame was spread throughout the land, by the name of the sleeping preacher. At last King James commanded him to be brought to the court, where his majesty sat up the most part of the night, attending the event; and at length the seeming sleeper began to pray, then pronounced a text, made his division of his text, and applying to his purpose, for in his preaching he used to inveigh against the pope, against the cross in baptism, and against the last canons of the church of England; and having ended his sermon, seemed to continue sleeping. His majesty having thoroughly observed what he had there heard and seen, departed to his lodging; and within a few days after called the said Haydock before him. After some conference, the king in his princely wisdom discovered all his drifts and practice. The offender being no way able to justify himself, acknowledged his abuse unto God, to his majesty, and the world, and humbly besought mercy of his majesty. The king most graciously pardoned him conditionally, that in all places he acknowledge and confess his offence, because the people greatly supposed, and many verily believed, his nocturnal preaching was either by inspiration or by vision.

His confession is thus expressed:—"I do, in the naked simplicity of a thankful and most penitent heart, ingenuously confess and acknowledge that this use of my nocturnal discourse, seeming to be in a sound and deep sleep, when indeed I was waking, and had perfect sense of that I conceived and spoke, than when by day I attempted the same, was, from the beginning, a voluntary thing done with knowledge, upon a discovery in myself of a greater ability and freedom of invention, memory, and speech, in that mild, quiet, and silent repose of the night, than in the day time I found."

THE GUILLOTINE.

This instrument of judicial punishment in France derives its name from a Dr Guillotin, one of the most distinguished physicians in Paris, and a person who embraced with ardour the cause of the revolution, and was elected one of the Deputies to the National Assembly. It is supposed by many that Guillotin was one of the first sufferers by the instrument which bears his name; but it seems this was not the case. The following notice of him has been translated from the *Biographie Universelle*, by a writer in a London newspaper:—

"Guillotin conducted himself with moderation in the National Assembly: he directed his attention there to different objects of public utility, among others, to the plan for the organization of the Faculty of Medicine; and he took a part in the most remarkable resolutions of that body when it became the Constituent Assembly. After it had decided that crimes were *personal*, Guillotin proposed to substitute decapitation for other punishments, on the ground that, in the opinion of Frenchmen, that species of death did not attach infamy to the family of the criminal. The proposition was adopted: its author then pointed out a machine, which had been long known, as proper for the infliction of death, without giving any pain to the sufferer. Men of the best character at that time applauded the humane motives of the philanthropic deputy in selecting this instrument of punishment. Unfortunately for Guillotin, some wags gave his name to the machine, of which he was not the inventor, and which he had only brought into notice. Still more unfortunately, this machine became, in the hands of the ruffians who were masters of France during two years—the duration of which was equivalent to more than two centuries—the instrument of the most horrible vengeance, of the most odious crimes; and Guillotin, who was himself imprisoned, and ready to figure as a victim in the daily scenes of carnage with which our infamous tyrants glutted themselves, had a thousand times to grieve at seeing his name attached to the devastating axe with which the cannibals had armed their executioners. One feels astonished that Guillotin had not solicited permission from the government to relinquish a name which from that time must have been unsupportable to him. After the termination of his political career, Guillotin resumed the functions of a physician, which it would have been perhaps better for his own repose if he had never quitted. He enjoyed, up to his last moments, the esteem of all who knew him. Dr Guillotin died on the 26th of May 1814, aged seventy-six."

POLLY PARTAN,

A BALLAD.

O, pretty Polly Partan! she was a damsel gay,
And, with a creel upon her back, she every night would stray
To the market-cross of Edinburgh, where singing she would stand,
While the gayest lords in Edinburgh ate oysters from her hand.

O, such a beauty Polly was, she dang the fish-wives a'—
Her cheek was like the partan's back, her nose was like its claw
Oh how divinely did she look, when to her face there cam'
The blushes that accompany the taking of a dram!

Her love he was a sailor, a sailor on the sea,
And of a Greenland whaler the second mate was he:
But the Northern Sea now covers him beneath its icy wave,
And the ice-berg is the monument that lies upon his grave.

As pretty Polly Partan one night was going home,
And thinking of Tam Hallibuck and happy days to come,
Endeavouring to recollect if she was fou or not,
And counting that night's profits in her kilted petticoat.

She had not gone a mile, a mile down the Newhaven road,
When the spirit of Tam Hallibuck before poor Polly stood;
The hiccup rose unhiccuped through her amazed throat,
And the shilling dropt uncounted into her petticoat.

O, cold turned Polly Partan, but colder was the ghost,
Who shiver'd in his shirt as folks are apt to do in frost;
And while from out his cheek he spat the phantom of a quid
From the ghost of his tobacco-box he lifted off the lid

"Oh! Polly," cried the spirit, "you may weep nae mair for me,
For my body it lies cauld and deep beneath the frozen sea;
Oh! will ye be my bride, and go where sleeps your ain true lover,
The tangle-weed shall be your bed, the mighty waves its cover?"

"Oh, yes, I'll go!" cried Polly, "for I can lo'e nane but you;"
And she turn'd into a spirit, and away with Tam she flew:
And in her track, far to the north, a ghastly light there shone,
Her *coats* were like the comet's tail, her fish-creel like the moon.

And some folk about Buckhaven, that were lecturing that night
On th' aurora borealis and its beauties all so bright,
Saw the spiritual lovers, with the lightning's quickest motion,
Shoot down among the streamers like two stars into the ocean.

The first thirty-six numbers of the Journal, originally published in a folio shape, are now reprinted in the present small size, by which means sets of this work from the commencement may now be had, in every respect fitted for binding. A title-page and index are likewise prepared for the first volume, and may be purchased at the price of a number. Those who have not preserved their numbers as published, may have the first volume, done up in boards, from the publishers or their agents.

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS'S EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 77. SATURDAY, JULY 20, 1833. PRICE THREE HALFPENCE.

CALLS.

THE subject of calls, though of late much discussed in various quarters, is not yet by any means exhausted. It is a subject of great importance to the community, especially the female part of it, and deserves to be treated with all the reflection and carefulness that can be had. "My dear," said Mrs Balderstone to me one fine day, "I am shamefully behind in my calls. That 'ladies' work,' and one thing and another, have kept me pretty close to the house for the better part of half a year, and during all that time my arrears have been accumulating in such a way that I now hardly know how to face my friends. I declare it would take a full week to pay off all the calls that I am owing. And then, as for yourself, you know you never have once paid a morning visit since you were married. That endless *business* of yours occupies you so much, that you neglect every thing else, and your own health into the bargain. I really must have you pulled out of the house to-day, to take a walk with me. Suppose you just for once accompany me on a round of calls, and see two or three of those friends of mine who have so long expressed an anxiety to see you, but whom you have never been able to see, either in their houses or your own. Yes, yes, you *will* come. It will be *so* delightful to have *you* out for a day. See how fine the day is! You cannot resist: it *will* do you so much good," &c. There was no resisting blandishments like these, particularly as I really had nothing better at the time to do. I therefore dressed myself somewhat punctiliously, and sallied out with Mrs Balderstone, who seemed to enjoy excessively the conquest she supposed herself to have gained over my propensity to stay at home. Under my left arm went the good lady herself. In my right hand hung her reticule, and, at all the shady places, her parasol was also committed to my charge. "Where shall we go first?" inquired I. "Oh, just leave it all to me," responded my spouse, in her usual absolute manner—a style of speech, be it remarked, which, though I generally tolerate it in matters indifferent, would not be submitted to in others of a graver nature. Only, I am always of opinion that it is best to keep up one's powers of resistance till there is a real occasion for them. Well, away we went; the sun shone gaily out; the streets were well watered; the great fashionable street was in a stir; and it *was* "so" delightful. The chief scene of our intended inroads was in the distant part of the town; so we walked, and walked, and better walked, as the nursery stories say, till we were at length so much fatigued that we could hardly hold out any longer without both rest and refection. "It is *so* fortunate," remarked my wife, in reference to our exhausted condition, "the first call we have to make is upon honest old Mrs Davidson, who is never from home, and who always presses people to wine and cake. She is considered, you know, as a very plain kind of person; but she certainly *is* kind." No more respectable character could have at that moment been presented to me; and burning with prospective reverence for the good old woman, we approached her door. I had some notion of even taking the liberty of asking this worthy Christian for a glass of beer—that is, supposing that she should not herself offer it. What—what was our grief when we were informed that Mrs Davidson was from home! She had gone to spend a fortnight in the country, and was not to be back till Friday week. Friday week! echoed my spirit within me—or some other organ—the very idea of such a stretch of time before being able to partake of the anticipated hospitality, made me nearly faint upon her threshold. Women, however, are proverbially fertile in resources. "Though Mrs Davidson has failed us," said my spouse, "there is Mrs Galloway, my old school-companion—Jessy Carmichael, you know—she that was married last year—lives only two streets off; and though it is out of our line of march, I think we had better go there before calling any where else, for I think she is sure at least to offer us a glass of wine. She returned my first call about the New Year, and I have not seen her since. She will be thinking, I dare say, that we have cut acquaintance." Of course I had no objection to try Mrs Galloway, being quite indifferent as to the port we should make for, provided only that *port* should be found after all. Pleasing intelligence! Mrs Galloway was at home. We were shown into a drawing-room, bearing that appearance of exquisite arrangement and perfect lustre of polish which strikes the beholder, so invariably, with an idea the opposite of eating or drinking. Oh, thought I, there is nothing for us here. And I was right. Mrs Galloway, who soon appeared, received us in a manner not at all peculiar for any thing, and, after the usual chit-chat, permitted us to take our leave unregaled. We now called on some other friends, but all were from home. "Is there no one you are sure of?" inquired I. "Oh, yes," said Mrs Balderstone; "just come along to the next square, and see the Stewarts; they have a hot lunch every day, you know, exactly at two, and we are just upon the hour. This cannot fail us." I acknowledged that, if she were quite certain as to the habit of the lunch and the hour when it took place, we had a good chance in this case; and accordingly we were soon at the door of the Stewarts. Oh transport!—not only were the good folk at home, but, at the very moment the door was opened, we became as assured as the olfactory sense could make us, of the fact we had just been debating. The lunch of the Stewarts, like the French charter under Louis Philip, was a reality, and to all appearance a pretty substantial one. Well, we were shown up stairs—not into the family parlour, however, but into a small speak-a-word room, where, after we had remained for about three minutes, we were joined by Mrs Stewart, all in a flutter of apparent pleasure at the unusual honour of a visit from *Mr*, in addition to Mrs Balderstone. Now, thought I, now is the time. The lunch cannot keep long. You must ask us down. What, what! no invitation—still all talkee, talkee, and no eatee, eatee! Immortal powers, it was so! There did Mrs Stewart sit for ten minutes, without ever seeming to suppose that either we or herself had either taste or smell. Strange mischances sometimes occur in domestic matters. There may be visitors in one part of a house, whom you cannot bring into contact with others who have arrived later. And such might be the embarrassing case of this lady; yet it was strange, passing strange, and went to a degree above all common precedent, that we should have been coolly conducted through the notorious fumes of this hot lunch, and permitted to depart with appetites almost savage, to seek somewhere else for the solacement which we had there so confidently expected. I now saw that calls were a business which did not support itself, and I proposed to my amiable partner, that, before proceeding farther, we should refresh ourselves by the only mode which presented a perfect certainty of effect—that is to say, by adjourning to a restorateur's. She was piqued, however, to make out her case without resorting to that expedient, and entreated me to accompany her on just one other call, where she felt quite certain of success, as she was on such an intimate footing with the lady, that she could take the liberty of asking for something. I consented, and, after traversing another street or two, we arrived at the house in question. While I was knocking, Mrs Balderstone said, in an insinuating tone of voice, that, should this lady be from home, there were two others living within a few doors, upon whom she had intended to call, and who were equally certain to provide us with some refreshment. It was evident that my worthy spouse entertained little hope of my consenting to go any farther: she merely threw out the hint, intending to pull me on yet a little way, if I *would* go, but not otherwise. "Is Mrs Simpson at home?" inquired the dame. "No, Madam," answered the servant, "she is out." "Well, just one trial more. It is only across the street." I consented. Rat, tat, tat. "Is Mrs Paterson at home?" "No, madam, she is out." "Ay, ay," said I, after we had given our cards and retired, "and the children are out too, I could warrant, and the cat, and the dog, and the fire also. My dear," I added seriously, "it wont do any longer. This going about, leaving cards at doors, may answer very well for ladies; but men have something else to attend to. How it may be with you I know not; but I must fly to Doull's, or else I shall sink on the street." "Well well, go away," said Mrs Balderstone pettishly; "you men have no sense of what is required in society. For my part, I have at least ten other calls to make, and make them I will, though I should have to take a coach home. So adieu." We then parted, I to solace nature, and my wife to fulfil, as she called it, the ends of society. When we met again at dinner, I used some art to discover her adventures subsequent to our parting. It appeared that of the ten persons she had called upon, she had seen one, who, at her request, gave her a glass of wine. The other nine were all out, probably invited by that very excellence of the weather which had tempted forth Mrs Balderstone, and engaged, no doubt, in the same truly rational employment of leaving cards at the doors of all their missing acquaintance. Some of them had in fact been calling upon Mrs Balderstone in her absence, and I felt myself justified in forming a theory, that, on a fine day, all the world is abroad in the vain hope of finding each other at home. What was the most amusing thing of all, I discovered that there were a great many punctilious rules in the female world, in reference to this visionary kind of intercourse. The friends of a newly married lady call upon her first. She returns the visit as a matter of duty, after which, if the friend does not come again or invite the young couple to her house for a particular night, there is no more of it—the friendship is dropt. If it be proposed by the male friends of two ladies that they should become acquainted, the unmarried calls upon the married, or the junior upon the senior; that call is returned; after which, whether they actually saw each other or not, a friendship is supposed to be established: they have become friends by cartel. When a lady comes to reside for a time or permanently at a place where she knows several individuals of her own sex, those individuals are expected to pay her the first visit. And so forth. In fact, the political arrangements of the kingdom of Lilliput were not more amusing than the regulations of womankind on the subject of calls. A modern British lady walks literally by card, and the whole system resolves itself into a matter of pasteboard. Seeing how often the card represents the lady herself, she generally takes care to have it of the very finest foreign fashion, and the engraving in Kirkwood's best manner, so that her other self may bear an appearance as respectable, comparatively, as her own. Cards and women have thus become convertible ideas; and if the cards be only preserved, it probably will not matter much, ere long, although the whole female creation should become extinct.

Columns for Schoolboys.

OVID—VIRGIL.

The Roman poets now claim our attention, and of them the two here mentioned are those with whom schoolboys are generally most conversant; and concerning them, therefore, we shall now bring forward some observations, beginning with Ovid.

Publius Ovidius Naso, or, as he is called by us, Ovid, was born at Sulmo, a town in Italy, about ninety miles north-east from Rome, in the year 43 before Christ. He and Tibullus, the celebrated elegiac poet, are said to have been born on the same day. Ovid's parents were of equestrian rank, and in possession of a good estate; and, being thus able, it appears they bestowed upon him an excellent education. His uncommon progress in his studies was a natural consequence of great application, united with great genius. That levity, or rather dissoluteness of disposition, which disgraced his riper years, did not interfere with his youthful attainments in literary pursuits. He seems to have displayed his poetical vein at a very early period; and, like our Pope and Cowley, he may be said to have lisped in numbers. Warmth of affection and benevolence of heart, added to elegance of manners and brilliancy of wit, rendered him a most agreeable companion. His conversation was suited to all descriptions of men, cheerful, grave, lax, or rigid, according to the taste of those around him, or the train of thought prevalent in his own mind. The father of our poet appears to have been a man of strict morals, and his reproofs probably contributed to restrain the dissoluteness of his son. Intending him for the law, he directed his studies with that view; and to parental inclination, Ovid for a time submitted. His talents were no doubt well adapted for attaining to great eminence in that profession. Quickness of apprehension, felicity of language, and fluency of expression, which he certainly possessed in no ordinary degree, would have soon placed him high among Roman orators. But a few successful pleadings at the bar finished his career as an advocate; as the bent of his mind induced him to forsake every pursuit for the cultivation of poetry. From this period, in particular, the irregularity of his life is greatly to be lamented. The impurity of his mind appears in the indelicacy of his verses. It is impossible to read many of his poems, but with the deep regret inseparable from contemplating the prostitution of splendid talents to so vile and criminal a purpose. Who, without horror, can reflect on the character of that man, who has been wicked in proportion to the means which he had of excelling in virtue, and used the powers, which heaven had so abundantly conferred upon him, only to give allurements to vice, and lustre to crimes? He continued for a considerable time in great favour with the Emperor Augustus; but that monarch at last banished him to Tomos, a town situated in a very inhospitable region, in the country of Pontus, on the borders of the Black Sea. Ovid's fortitude entirely deserted him in adversity, and he meanly flattered Augustus to recal his edict; but neither the importunities of the poet, nor the urgent solicitations of his numerous and powerful friends, produced any alteration in the emperor's resolution. Nor did the accession of his successor, Tiberius, bring the smallest advantage to the unfortunate exile; as neither his effusions of sorrow, nor the claims of friendship, could procure his return, or even a change of residence. In justice to the natives of Tomos, it must not be forgotten that they treated the poet with every mark of respect, and exerted themselves to alleviate the miseries of his situation. After languishing among them for eight years and some months, grief and disappointment at length broke his heart, and he died in the fifty-ninth year of his age, and the seventeenth of the Christian era. The licentiousness of Ovid's verses was the ostensible reason why Augustus banished him, and treated him with such severity; but it is quite certain that this could not be the real cause of his punishment; and, accordingly, few events recorded by antiquity have oftener been subject of discussion than the true cause of Ovid's banishment. Some have alleged that it was his having made love to Augustus's daughter Julia; but this is quite uncertain, and, since he himself has not chosen to mention it, the truth of the matter will most probably never be discovered.

The works of Ovid are, The Metamorphoses, 15 books; The Fasti, 12 books; The Tristia, 5 books; The Heroides; Love, 3 books; The Art of Love, 3 books; The Remedies of Love, 1 book; Epistles from Pontus, 4 books; The Ibis; The Halieuticon, or Fishery; A Poem about Beautifying the Face; and Medea, a tragedy. Of the last only a few fragments remain. The former two are also imperfect, and six books of the Fasti are lost. All the rest have been transmitted, without mutilation, to modern times.

The Metamorphoses is undoubtedly the greatest of Ovid's works. That he intended to rest his reputation as a poet on this performance, is manifest from the lines with which it concludes. But he was compelled to leave his native country, and go into exile amongst barbarians, before he had given the work his last polish; and it is said, that before going away he destroyed his own copy; and had a friend not been in possession of another, that admirable production had been for ever lost. It ought, therefore, to be judged of with the leniency of a posthumous publication. He has performed, in this work, the difficult task of giving a connected account of the marvellous occurrences and adventures from the creation of the world to his own time; and this almost impossible task he has performed, without the appearance of art, in numbers extremely melodious, and in language highly poetical. The fertile genius of Ovid was requisite to form into a regular design histories so varied and insulated; yet this he has accomplished, in every instance, by one means or another, with almost mathematical precision. The felicity of invention, variety of imagery, exuberance of fancy, and adaptation of language, which the Metamorphoses display, cannot fail to command universal admiration. The diction and ideas are never at variance. He is equally master of the familiar, the sportive, the tender, the grand, the awful, and the sublime. His descriptions are not only lively, but enchanting; and he places the scene so distinctly before the reader, that he becomes, as it were, a witness of every action. The moral remarks are not very numerous, but they are both excellent and appropriate. He was a master of the passions; and it is to be regretted that his tragedy has not been handed down to posterity. We find him sometimes, however, weakening a noble idea by prolixity; and instances of false taste too often occur. Faults are also to be found not unfrequently in the structure of his verses; but this is to be attributed to the rapidity with which he composed; and the best Latin poets are perhaps chargeable with the like inaccuracy or negligence. These errors scarcely deserve notice in a work of so great and varied excellence. The first and second are perhaps the most finished books of the whole. His description of the creation is highly animated and poetical. Nor is this its sole merit. No philosopher of antiquity has given such a natural and rational account of chaos, the separation of the primitive elements, and the formation of things. It proves him to have been the best philosopher of the Roman poets; and it is evident that he must have read the works of Moses, most probably in the Greek translation of the Septuagint, as there is a striking coincidence between his account of the creation and that of the inspired writer. "After reading the first 415 lines of book first, it might form a very useful exercise to the young scholar to compare them with the first nine chapters of Genesis, and to point out the coincidence of sentiment and description between the inspired historian and the Roman poet."* Indeed, in his first five books are evidently contained, as well the account of creation, as other matters mentioned in the Book of Genesis, down to the building of Babel; and in the seventh there is an account of the flood, the whole being disguised with poetical licences and fictitious names to conceal what source he had it from. The sages of those times admitted that there were great mysteries contained under the emblems of Phœton, Niobe, Deucalion, and Pyrrha, which are introduced by Ovid into his Metamorphoses. Phœton, they said, represented the burning of Sodom; Niobe the turning of Lot's wife into a pillar of salt; the deluge of Deucalion was that of Noah; and Phoroneus was Pharoah drowned in the Red Sea. These were all historical truths derived from the Jews, and taught the inhabitants of Egypt and Greece, most of whom considered them as real events in Grecian history.

Publius Virgilius Maro, by us called Virgil, was born at Andes, a village near Mantua, about the 15th of October, in the year 69 before Christ. Nothing certain is known as to his parentage; but his father is said to have been a potter of the name of Maro, and his mother's name Maia. He seems to have spent the first seven years of his life at Mantua, whence he removed, first to Cremona, and afterwards to Milan; in which places he prosecuted his studies with great assiduity. After Augustus had defeated the republicans, he found it necessary to make allotments of land to his troops in lieu of their pay; and these were assigned to them principally in the neighbourhood of Mantua and Cremona. From his own writings, and the concurrent testimony of antiquity, there is no doubt that Virgil was deprived of his paternal lands by this unjust settlement. Soon after this expulsion he went to Rome, where he was introduced to Augustus, but by whom is uncertain. He seems to have succeeded completely in gaining the emperor's favour, however, as it is certain that Augustus dismissed him with great marks of esteem, and recommended the charge of Virgil's affairs to Pollio, who is much celebrated by him in his Eclogues, and was at that time lieutenant of the Cis-Alpine Gaul where our poet's patrimony lay. It is most probable that the emperor restored him his lands on account of the excellence of his poetry; and it has been alleged that he has shown his gratitude in his first Eclogue, where part of his own history is recorded under the character of Tityrus. Being thus relieved of his domestic cares, Virgil went on a journey to Naples, in the neighbourhood of which were many delightful villas of the Roman nobility, and particularly the town of Baiæ, which is much celebrated as a favourite summer residence of the emperors and grandees of Rome. His abode here contributed much to the re-establishment of his health, which was always delicate; and he here devoted himself entirely to the study of poetry, in preference to that of law, which, it appears, he had begun. In the cultivation of his poetical talent, he succeeded so well, that he formed an excellent style, and rendered himself master of that happy turn of verse, in which he is thought to surpass all the Latin poets, and, in a less advantageous language, to equal even Homer himself. It was during his residence at Naples that he is supposed to have composed his great work the Æneid. He visited Sicily, also, and frequently went to Rome, and other parts of Italy, along with the emperor, with whom he continued, through means of Mæcenas, the great patron of learned men of those days, in terms of the most intimate friendship and favour; but he always returned to his privacy at Naples. At length he took a resolution of travelling into Greece, with the intention of putting the last hand to his great poem the Æneid at Athens, and then proposing to devote the rest of his life to philosophy, which had always been his principal passion. At Megara he fell into a languishing distemper, and meeting with Augustus, who was returning from his eastern conquests, he accompanied him to Italy, and died at Brundisium, in the 51st year of his age, and in the year 19 before the Christian era. He was buried at Naples, according to his own desire.

Virgil's works consist of his Bucolics, or Pastoral Eclogues, of which there are ten; his Georgics, or Poetical Treatise on Rural Affairs, in four books; and his Æneid, or epic poem about Æneas, in twelve books. The refined excellence of the Pastorals of Virgil proves that they were not his first attempts at poetic composition. Both the language and the ideas rise greatly above the ordinary strain of pastoral poetry, and may be considered as a foretaste of the more laboured and finished strains of the Georgics, which is the most perfect poem of the didactic kind which the world has ever seen. He is said to have spent three years in writing the Pastorals, and seven years in the composition and revisal of the Georgics; which is very likely to have been the case, since elegance so consummate as is displayed in these poems can only be attained by frequent and patient revisals, directed by great taste and great genius. He most probably composed the Pastorals at the desire of his friend Pollio, who is celebrated in the third, and referred to also in the fourth, which is commonly inscribed Pollio. It is said that Mæcenas suggested the subject of the Georgics, in which there may be some truth; but the bent of Virgil's mind must have been naturally turned to rural affairs, of which he discovers most extensive and accurate knowledge, and, indeed, his mind seems quite absorbed in the points of which he there treats, and the splendour of many passages has scarcely any thing resembling it in the whole range of ancient and modern poetry.

Virgil is thought to have begun his Æneid when he had finished the Georgics, and when he was past forty years of age; but that work had been, in truth, the subject of much earlier meditation. In the Epic, as well as in the Pastoral, he had no predecessor in the Latin language. The writings of Homer presented him with a very perfect model of heroic poetry, and of this he has taken advantage in various parts of his work; but the design of the Æneid is still very different from that of the Iliad or the Odyssey. In the former, Homer sings the wrath of Achilles, and in the latter the voyages of Ulysses. The conception of the Mantuan bard, in dignity and national interest, surpasses both. His work bore anciently the title of the "Imperial Poem," or "Roman History;" and it certainly deserves the title, for all the most important affairs and persons of Rome are comprised in this poem. He deduces the history of Italy from before Saturn to the reign of king Latinus, and reckons up the successors of Æneas, who reigned at Alba for the space of three hundred years, down to the birth of Romulus; after which he speaks of the principal exploits of all the kings, till their expulsion, and the settling of the Commonwealth; and then the most remarkable occurrences of his own time, and particularly the exploits of Augustus, are recorded. Of the national vanity of the Romans, Virgil makes the happiest use, and interweaves with the destiny of his hero Æneas, who is conducted by the Fates from Troy to lay the foundation of the mighty Roman empire, a great many local, traditional, and family particulars, which commanded the attention and secured the favour of his fellow-countrymen. Happy in the subject of his poem, he was equally happy in its execution. In the numbers of Virgil the Latin language seems to assume a new form, and for the grandeur and sublimity of the Æneid, every other Latin writer may be searched in vain.

The characters of the Æneid, or the persons who form, as it were, the machinery of the poem, are Æneas, Turnus, Dido, Anna, Ascanius (the son of Æneas), Latinus, Lavinia, Amata, Juturna, Camilla, Evander, Pallas, Mezentius, Ufens, Messapus, and some others of less consequence. Of the celestials, Venus and Juno, the former in the interest of her son Æneas, and the latter against him, exert all their power, appealing in turn to Jupiter, and engaging others of the gods in their respective interests. The poem concludes with the death of Turnus, a Rutulian prince, whom Æneas kills in single combat, after a fierce war with the people of Latium, which forms the subject of the last six books, the first six being occupied with

* Dymock's "Bibliotheca Classica," Art. *Ovidius.*

the adventures of Æneas during his voyage from Troy to the coast of Italy.

Translations of the works of Virgil are quite common, and, therefore, it is entirely unnecessary to give any thing of the kind here. Dryden's translation is the most popular in English.

Virgil, in his last illness, ordered the Æneid to be burned, because he had not put his last hand to it; and the world must acknowledge obligations to the Emperor Augustus for not complying with this request. By his command it was revised by Varius and Tucca, two of Virgil's friends; but they had instructions not to add a single line, nor to cancel any one that they found defective, which accounts for the number of broken lines that occur in the Æneid.

SUPERSTITIOUS FEARS.

Fear is capable of producing the most distressing and irrational effects on the powers of man. Fear is a predisposer of the body to contagious disease, induces cowardice where nothing should be dreaded, and, under circumstances of great excitement, closes up the understanding. It is no less extraordinary than true, that fear arising from evident danger is less subduing than when produced by the powers of imagination. There are numerous occupations, surrounded by terrors, which lose their effect on the mind by frequency of recurrence. The pursuits of the soldier, the miner, the seaman, and others, will prove, that on hearts accustomed to look danger in the face, fear exercises no overwhelming powers, because, the senses being first to discover the danger, its effect is proportionate to the experience or intimacy with the cause. Ignorance is a cause of astonishment, and darkness heightens the effect of fear, only because the senses cannot act in conjunction with the understanding. If light be cast on the scene, the alarming objects, if there be any, are perceived, and resistance is calculated accordingly. That there are gradations of personal courage, is as certain as that there are various degrees of strength, or of experience; but timid persons, however they may have become so, have objects of terror ever prepared to destroy their powers of discernment. If an individual be selected, possessed of health, moral courage, and experience, in all cases of alarm his physical powers assist his mental energies, and he is not easily subdued: certainly there will be no evident prostration of his understanding. The cause of yielding to imaginary terrors, perhaps, may be traced through a morbid state of the nervous system, and an ignorance of the laws of nature, up to tales of supernatural appearances recited in the nursery, the effect of which is a mental slavery, and from which there is no relief, but in examinations of cause and effect in nature, as leading to a knowledge of nature's God, where it will be found there is so much to fill the mind with satisfaction and thankfulness, that there is no room for imaginary terrors, nothing to dread save doing wrong. Conscious in its integrity, the mind is unconquerable.

The following anecdote, founded on fact, may be related in illustration:—A young gentleman, whose name was Lowry, had been brought up without the intervention of a nursery-maid, because his parents had experienced the sad consequences of frightening children. They resolved that the dawn their son's reason should not be overcast by the night of superstition, and that he should not become the slave of imaginary terrors. He was watched by his mother, and instructed by his father, with the greatest attention, until the age of fourteen. He then passed into the world, and, as he grew up, occasionally heard, from the tongues of the ignorant, the avowal of fears to which he was a stranger. He smiled at their tales, and laughed at the most horrifying incidents; they passed lightly across his mind; the time was past for mental degradation to be fixed. A ghost was no more terrific than a fairy, a griffin, a sphynx, or a punch. They were all productions of various imaginations.

Mr Lowry, when about twenty years of age, chanced to be at Hampton Court at a time when the place was crowded to excess. It chanced, also, that the chambermaid at the Toy Inn had a relative who was left in care of a suit of apartments in the palace. The girl, to oblige Mr Lowry, and to put a trifle into her relation's pocket, arranged the affair. The suit of apartments was in the front, on the left of the ancient part built by Cardinal Wolsey. The entrance was by a stair, in the cloister surrounding the first quadrangle.

To this lodging, about midnight, Mr Lowry was conducted by the Boots of the inn, and delivered into the care of old Mary, the chambermaid's aunt, who, in order to render all comfortable as possible, had lighted a fire in the principal chamber, and placed a wax-light on the table. Mr Lowry was shown in, with assurances that all was perfectly aired, and bade good night. He proceeded to inspect his room, which was spacious, having tapestry in the different compartments of the walls, a lofty bed, with old-fashioned damask furniture, and the floor covered with modern carpeting. He sat down by the fire, and made a few notes in his pocket-book, during which he heard a noise, which he thought was occasioned by a movement of the bed-curtains: he looked around—all was quiet: he took the candle, examined round and under the bed—all quiet. He returned to his seat. The palace clock in the adjoining court struck twelve. He wound up his watch, and proceeded leisurely to undress; but as the moon was shining, he looked out at one of the ancient casements, and observed the shadows of the tall trees that grew in the front court, between the trunks of which he could see the recently painted wooden bridge that crosses the Thames to Moulsey: he felt the night air, and withdrew; put down the huge night-bolt at the door, and climbed into bed. He had not been accustomed to down, and therefore disliked being buried in luxuriance; but he was there, and anxious to sleep. A number of trivial circumstances presented themselves to his mind's eye, and prevented repose: in vain he endeavoured to free himself from the interruption—they passed and returned. He thought there might be too much bedclothes, and threw off a weighty counterpane; but, while composing himself, he heard a gentle tapping: he listened attentively, and concluded it came from the spider-like insect called a death-watch. While he yet listened, it became louder, or approached the bed. He sat up to ascertain this. Being vexed by the annoyance, he lay down on the ear with which he heard most distinctly. Still the tapping noise continued. He left the bed, lit the candle, and approached the spot whence the noise proceeded: he could see nothing to cause it, and retreated to his bed. The continuance of the tapping became disagreeable and irritating—he could not sleep. Again he examined minutely every part, in the hope to discover and crush his disturber. Nothing could he find. He put out the candle, and slowly retreated to his bed again, convinced the insect must be in the lock of the door, and there it might remain hammering. He would endure the disturbance, since it could not be prevented—when, to his surprise, the bed-curtain moved! He fixed his eyes on the object. The fire had burnt low; yet a dim light, with an occasional flicker, enabled him to ascertain the fact. The curtain moved again. Well, thought he, this is too bad. Weariness and vexation were making powerful attacks on the equanimity of his temper. He felt this. Again he left the bed, lighted the candle, and examined the room without discovering a cause. Simple as these circumstances were, they destroyed his rest, and he contemplated calling to the old woman; but, on reflecting that he could not be relieved by disturbing another, he desisted. On a closer investigation, he found an upper portion of an old casement had been left open, the air through which had waved the bed curtain; and that the tapping at the door was an action of a small ornament on the key-hole, occasioned by a draught of air. He thrust a bit of paper into the key-hole, closed the window, and again retired to bed, wishing he were at home. Before his head was on the pillow, he distinctly heard footsteps in the gallery! He presently saw a part of the tapestry open, and two figures slowly enter the room! Who are you? demanded Mr Lowry in a loud voice, springing off the bed to defend himself. They were two soldiers, who had been directed, by the corporal of the relief guard at the palace gate, to discover the cause of lights popping in and out at those apartments in the absence of the family. They had alarmed the old woman, who had, in her fear, conducted them to the door in the tapestry. Mr Lowry explained, and passed the remainder of the morning in tranquillity.

To such a mind as Mr Lowry possessed, the moving of a curtain, the tapping like a death-watch, or the sudden appearance of two figures in his bed-room at night, were disagreeable disturbers of repose; but no dread of supernatural agency affected him, and he was free to act as became a rational being. To an individual whose energies had been palsied, whose understanding had been strangled by dread of unearthly visitations, those circumstances under which Mr Lowry was placed might have been fraught with most melancholy consequences. The frightened man, void of moral courage, driven to his last extremity, struggling with fearful events and associations of chimeras dire, despairing yields, and becomes an idiot for the remainder of a miserable existence.

Parents, therefore, cannot be too cautious respecting persons to whom they entrust their infant offspring, since one breath of the mildew, superstition, may blight the fairest hope of manly understanding.

"THE MAN."

Every morning, either good or bad, both summer and winter, a personage passes our window, known by the significant term of "the man." I know not now for how long a period this has been the case; it has been for years, and custom has now so reconciled the periodical return of this object, that he is expected as regularly as the sun himself. Just as breakfast is finished, and while the tea equipage is in the act of being carried away, some member of the family loitering at the window is sure to exclaim "here goes the man." There can be no mistaking him—his dress, and figure, and gait, are invariably the same—his image is indelibly impressed upon the minds of all the household; nay, many pen-and-ink sketches of him, taken in playful hours, lie scattered about, or adorn the boards of portfolios. He is of a spare and rather tall figure, somewhat bent: his hat is worn somewhat slouched over his face, while the back rim is turned up by coming in contact with his coat collar: his coat is of a brownish hue, almost threadbare, long in the waist and tails, but bearing the marks of careful keeping: his vest is of the same: his under garments are drab colour, with gaiters of the same buttoned up to the knees: he invariably carries with him a large brown-coloured umbrella, with round turned handle—in fair weather, snugly folded under his arm—in rain, widely displayed over his head: he has a slouching gait, but walks steadily and uniformly onward at a moderate pace: his countenance is spare, with rather large features: his eye is turned neither to the right nor to the left, but constantly onward, or on the ground before him: his expression might be called pensive or melancholy, suiting either deep and serious thought, or the absence of thought altogether. There are in it, too, one would think, the lines of subdued meekness and benevolence, or perhaps the absence of all passion whatever. I have said he is to be thus seen every day in the world, and year after year, thus only, and always the same. There is no change whatever in the appearance of his dress—it has always that half-worn shabby-genteel look, and never gets older: whether any part of it is ever renewed, I cannot tell; but, if so, it must be done with admirable keeping, as a painter would say, for I never can discover, from his hat to his shoes, any indications of change.

Who can this "man" be? has often engaged our eager curiosity. He is always alone, and never seen to mix in the business, or bustle, or enjoyments of the multitude. If the agitation of some new, or strange, or joyful event, engages the busy crowd of the city, this man holds on the usual tenor of his way unmoved and unconcerned. I have seen him pass by the gayest pageants, and scenes of the most melancholy bereavement, alike imperturbed and unexcited. He neither pauses to moralize with the old and the serious; nor, when the young and chubby groups of children dance mid their sports before him, is his countenance brightened by the contagion of one buoyant innocent smile. Sunday and Saturday are alike to him. When the Sabbath bells toll for morning worship, and the people crowd to their devotions, dressed out in their holiday attire, he never mingles with the throng, nor is any change discernible in the invariable disposition of his habiliments. I must confess that curiosity to know something more of this being has occupied my mind more frequently than perhaps many would deem the matter required. Even this, too, has been heightened by the reports of some of the younger branches of my family, who, having repeatedly followed his path, have always lost sight of him by some mysterious means, and returned foiled in their pursuit of his haunts or his employments. More than once I have, on accidentally meeting him, broken off from the pursuit of graver avocations, and fairly joined in the train of discovery. My attempts, however, were uniformly abortive. I have followed him through innumerable obscure streets and lanes, through many windings and doublings, and, at last, when perhaps my attention was drawn for a moment to something else, he has suddenly disappeared, and I could see him no more. After tracing him through the windings of many intricate streets, I at last one day saw him enter an obscure coffee-room. I followed into the same place, and, finding him seated with a newspaper of the day, I took my seat to wait his departure. After perusing the paper for about half an hour, he rose up, paid a trifle to the waiter, and departed. When he was gone, I eagerly inquired at the attendant whether he knew any thing of the person just gone out. He said he knew nothing farther of him than that occasionally he came there, looked over the newspaper, paid his penny, and departed. I next asked what particular paper he generally read; but here also my answer was equally unsatisfactory. The waiter said he took up indiscriminately any paper that happened to be disengaged. He is no political partisan, then, thought I: he is neither Whig, Tory, nor Radical, else he would be more particular in his selection. He has been seen sometimes to pause in his travels, and stare

for some minutes with his hand in his pocket opposite to some shop window, where goods for sale are exhib. ed; but these were never the windows where objects of art, such as sculpture, or paintings, or engravings, were displayed, to attract the eye of taste. He more commonly lingered before those where dried fish, herrings, cheese, &c., were piled up in profusion; but even here he never could be traced entering or making the least advance towards a purchase. He must have no relish for the fine arts, however, or his taste may be so exquisite as to look with indifference on all minor efforts, or his philosophy so profound as to banish such fancies from his thoughts. Is he a sensualist, then, or is his stoicism such as even to suppress the natural demands of appetite, and to make him pass by with unconcern the window of the drysalter?

The only time in my life that I ever saw him in company with another human being was once. While yet I was at some distance, I saw him seated on a bench in one of the walks, apparently in companionship with an elderly man, who sat beside him. My heart beat with a degree of exultation. I almost shouted out *Eureka!*—I have found you out at last. Here you are, in social converse with a friendly being: some communicative talk must assuredly pass on both sides; and, once in my life, I determined on playing the eavesdropper. I walked slowly, laying my plans ere I advanced to them; and while yet at the distance of a few yards, by good luck they both rose up, and proceeded in company on before me. I walked up in breathless expectation, till I was close behind them, and, by good management, sometimes keeping a little behind, sometimes by their side, or a little in advance, I remained within reach of hearing, without exciting the least suspicion of listening. In this way the two friends jogged on at an easy pace; but not a single word was exchanged between them. I am positive that neither of their lips once opened, except on one occasion, when a single monosyllable escaped the stranger, and a mere sound or humph seemed to echo back a reply on the part of "the man." I was terribly chagrined; and my disappointment increased, when, on coming to the end of the walk, where two streets led different ways, this Castor and Pollux separated, with a mutual wave of the hand, and I never saw them together more.

Years passed on; and although it cannot be supposed that "the man" engaged our thoughts so continually as the connected incidents here brought together might lead one to imagine, yet it is astonishing how often he became the theme of speculation, starting up to the dallying thoughts somewhat like the apparitions of the romancers; and, to show the hold that, in all that respected us, this mere automaton had taken of our minds, I may just mention, before concluding, a single incident. During the prevalence of a late awful calamity, a friendly physician who often forms a guest in our family circle was detailing to us one of those heart-rending scenes which he had just witnessed, and with all those powers of vivid description and simple pathos which make his narratives infinitely more striking than the best written works of fancy. The case was perhaps one of the most singular and awful which the ravages of that dreadful pestilence but too often afforded, and was, moreover, attended with the most mysterious circumstances. From a description of one of the principal actors, or rather sufferers, the whole circle immediately exclaimed, "That must be THE MAN!"

"Impossible," said one; "we certainly saw him pass this morning."

Doubts were started whether he had been seen or not, and much discussion and excitement prevailed during the evening, and I do believe a sleepless anxiety prevailed among some until the usual hour next morning should decide the fate of "the man," whether his mortal career was finished or not. The hour came, and "the man," with his umbrella, slouched hat, and bent figure, passed on, with imperturbed countenance, as usual, to the no small satisfaction of the eagerly watching group.

"He must be proof against the most malignant fangs of disease," cried one, "or else the doctor has been mistaken for once, and yet we cannot believe the doctor was ever mistaken."

"What, in the name of wonder, can this man be?" have I often thought within myself. Indeed, I have sometimes given way to the idea that he must be some mysterious murderer—perhaps he that murdered Begbie—the remorseless villain, who, in a dark and narrow alley, stabbed the innocent man to the heart with one deep wound, and rifled him of the bank treasure he was carrying to its destination. But no, no—one look again into the placid, subdued, I may say really innocent-like countenance of "the man," made me check all such thoughts, as wronging, most likely, the guiltless. Is he then some misanthrope, who drags along with him disappointed hopes, injured feelings, rejected affections? Is he some great-souled being, whose thoughts are above the thoughts of ordinary men, and who prefers converse with the Deity and his own heart, to the hum and buzz of the giddy and frivolous multitude? Or is he some low, grovelling, soulless, and penurious wretch, who, perhaps, with a pittance sufficient to supply the absolute cravings of nature, lives to himself alone, and never extends a feeling to his brethren of humanity—who walks out mechanically, to dissipate the day in brute exercise—who retires at night to his den, eats his solitary meal in silence, chalks up day by day the computation of his expenditure, wrung out of his penurious heart by the demands of his landlady—who has gone on thus, and may yet continue to cumber life's busy scene of enjoyment, till one day he shall drop into the grave, unknown and unregarded, and the world shall never miss him from its active, energetic, and bustling millions?

CHELSEA.

After visiting Greenwich, and ruminating on the architectural beauty of its hospital, and the pleasing appearance of its ancient mariners, there quietly anchored for the remainder of their lives, the stranger naturally wishes to pay a similar visit to Chelsea, an establishment adapted to the reception and maintenance of old invalid soldiers. But while Greenwich affords every thing to please, Chelsea offers little to admire or attract particular attention. The village of Chelsea, situated near the north bank of the Thames in a westerly direction from the metropolis, was once surrounded by open fields and gardens, having between it and the houses of Westminster an open heath famous from the number of its footpads and robberies, and interesting, in a newspaper point of view, for the murders committed at the "bloody bridge," as it is called, which crosses the dark rivulet as you enter the village. But all this is changed: London is now gone quite out of town, and projects its splendid stuccoed "streets," "places," and "terraces," across the heath, quite to the gates of Chelsea; and what with lines of iron railings, and police officers, the road has been divested of all pretensions to romance.

Chelsea Hospital, or College, is situated on a flat stretch of ground between the village and the Thames, though not so near the margin of the stream as the structures of Greenwich. The river is here still of considerable breadth, if at high water, and is enlivened by small boats with parties of young men sailing to and fro; but it wants the bustle of traffic which is seen below the city; the grounds do not rise into woody knolls as behind Greenwich; there is no proper landing-place for those who approach by water; and you are warned by an inscription, that those who enter the precincts of this military domain from the river will be prosecuted. As you enter the village, you speedily perceive, that, though not without good houses and streets, it has, generally speaking, a mean, dirty appearance, and is very unlike the sweet villages and neat small towns of the south. As you approach the hospital, through a street evidently far gone in a state of disrepute, you will most likely see drunkenness manifested in various stages, and hear sounds of revelry and debauch from the throngs in the numberless tap-rooms, bringing to your remembrance that you are not among a body of men conspicuous for their moral discipline, wherever they may be found.

To pass from this digression: the stranger now enters the gateway of the institution, within which he finds all decorum, neatness, and civility. The inmates, who do not number 500, are all old soldiers, having an air of considerable antiquity in their appearance. Individually, they are dressed in clothes entirely of a red colour, with a coat so large and flowing in the skirts as to put you in mind of the pictures of the battle of the Boyne, where the flaps of the coats of William's troops, as they pass the river, are seen floating on the stream; while their plaited queues are also perceived to hang down the back, and touch the surface of the water. Such is the impression conveyed by these old military garbs, that one could almost imagine the wearers had every one been at least in Marlborough's wars, or seen the siege of Namur. The hospital, which was planned by Sir Christopher Wren, consists chiefly of one large edifice of red brick, several stories in height, forming a centre and two wings, or three sides of a square, with the open side towards the bank of the Thames. On the north, where is the main entrance, the style of architecture is simple, being ornamented with only a plain portico. The inner part of the centre building is more decorated, there being here a piazza of good proportions, suitable to yield protection from the weather. In the centre of the open square interval stands a statue of Charles the Second, a monarch whose figure, in painting and sculpture, is repeated to satiety here as well as elsewhere. The only parts of the house considered worthy to be shown to strangers are the chapel and old dining-hall, both in the centre building. The chapel is neat and plain in appearance, the rows of benches being furnished with prayer books and hassocks, and the floor being paved with marble in alternate black and white squares. The pulpit and communion table, at the east end, have been recently decorated with splendid covers of purple velvet, fringed with gold lace, presented to the establishment by his present majesty, William the Fourth. Above the communion table there is a painting of the ascension, containing some good figures. The dining-hall is equally spacious, but is now disused as a refectory, though the tables stand ready covered for use. At the upper end there is a painting by Cooke, representing Charles the Second, with devices expressive of various attributes hardly historically correct.

The usual accounts of Chelsea mention that the ordinary number of in-pensioners is 476, and of out-pensioners not fewer than 80,000, who reside in all parts of the United Kingdom. The former are provided with all necessaries, and the latter have each pensions varying from L.7, 12s. to L.54, 15s. yearly.

THE NEW KNOWLEDGE.*

'Shall it be 'we,' then?"——Story of the Organ-Blower.

"The Press" is a phrase occasionally applied, we believe, by persons little acquainted with the world, to the machine which prints all kinds of literary matter whatever, whether it be sheets of books, or sheets of newspapers, or sheets of any other kind of periodical work, from the highest to the lowest price. Individuals who know better what is what, limit the application of this phrase to the newspapers alone, as being the only part of literature which really deserves to be called the Press—seeing that no other kind of sheet does the least good to mankind, but might just as well remain in its pristine state of whiteness. On the same principle, when sensible people speak of "taxes on knowledge," they never think of the tax on paper, or the tax on pamphlets, or any other kind of tax than the stamp duty on newspapers—seeing that newspapers, in reality, are the only vehicles in the world, of a literary kind, for communicating knowledge. Some foolish people may have a recollection of certain books which they read in youth, and which they believed to contain something like knowledge; but these persons are altogether in a mistake. There is nothing worthy of the term "knowledge" except what is in newspapers; and it is really a shame, after the newspapers themselves have been so long endeavouring to impress the fact upon mankind, that any body should still be ignorant of it.

There used to prevail among our ancestors an absurd taste for what was called history, by which was meant the narration of past events, for the purpose of instructing nations as to their behaviour for the future. This same thing then called history was considered as a branch of human knowledge. There were other things, called geography, geometry, chemistry, natural philosophy, and so forth, which were also esteemed as knowledge by our forefathers; but all this proceeded from the ignorance in which these worthy people lived as to newspapers. They did not know what real knowledge was till they got newspapers into their hands. They then found that all the chit-chat about Julius Cæsar and William the Conqueror, and all the prate about solids, and fluids, and machinery, and this thing and that thing, were mere stuff compared to what was now placed within their grasp. What was past history to present? What were the foundations of our constitution to the beautiful gingerbread pinnacles which are every day rising upon it? And then they were admitted by the newspapers into a familiar acquaintance with all the mysteries of the state, and all the relations of foreign cabinets to our own, and all the intentions of ministers about various matters, before even ministers themselves, in some cases, knew what they intended. It is true, these same instructors often found it necessary to contradict the half of what they had said. But what was that?—they had erred only from their excessive desire of sending forth knowledge as soon as possible to the people. Knowledge, they thought, was the most precious of all things, and better give it in a somewhat crude state than let it get cool, and so disgust the people. There was even a kind of rivalry among these generous men, as to priority of intelligence; and when one was able to give

* This *jeu d'esprit* on the newspapers is called forth by the pretensions of that class of publications to be considered as exclusively liable to what are called taxes on knowledge. It would not, however, have been published in the Edinburgh Journal (which is generally devoted to so much more useful purposes), but for the burlesques and misrepresentations which are constantly issued, respecting our unpretending publications, by the political journals. In return for falsehood and burlesque together, we give only burlesque, which must be considered as no very immoderate revenge; while we have a sincere hope that the exposure of some of the weak and reprehensible points in these self-called "best of all instructors," may lead to their reformation. It may at the same time be stated, that, as the defence of our own integrity is all that is sought for, we should be sorry if any of the respectable persons connected with the political press, who have never attempted to injure us, should feel aggrieved by our remarks. The uses of a newspaper press, where it is conducted on honourable principles, are universally acknowledged; and it is only to be wished that in some particulars it had itself a better sense of its own dignity

notice of an intended marriage between Lord Noodle and Lady Doodle before any of his brethren, what a triumph to his noble mind! what a depression to the equally noble minds of his neighbours! The desire of conveying knowledge became, in fact, an enthusiasm among them. In order, for instance, to be the first to communicate in London the important fact that a particular horse had won at Epsom or Doncaster, these great public instructors would put twenty horses to their speed, and spare no expenditure of money or trouble. To have been the first by two hours to tell such a fact, was enough for a newspaper to boast of for life. It could not be expected that the public would ever forget so splendid a benefit.

Entitled as the newspaper press is to be considered as the only real press, they would not hold that honour by such a powerful tenure, if they did not also decide in a schoolmasterly and authoritative manner as to the merits of the public questions which come before them. The newspapers, in reality, though they generally like to hear what the public thinks first, and do not consider themselves the worse of knowing which kind of opinions is permanently to be uppermost, are amazingly clever in giving their sentiments upon all kinds of subjects. Sometimes it will happen that the ministers—the very men that the king has chosen as the wisest of his subjects—will consider and consult, and consult and consider, about a thing for several months; and when they think they have got it all right, they will bring it forward for public discussion. Is it not astonishing?—the newspapers, who never heard of the thing before, and are completely ignorant of all the statistical facts on which it is grounded, will in a night or two, nay sometimes in a few minutes, come out with such a triumphant condemnation of the whole affair, that the ministers, who *did* know all about it, will pull it back with shame and confusion of face, and resolve to be a great deal more cautious for the future. What truly sage people these newspaper men are! And yet observe how, with the characteristic modesty of real wisdom, they never seek for any advantage to themselves—never even let themselves be personally known. It is all the public good they consult: they wish for nothing but porter, and the good of their country. It is fortunate, however, that the world does not permit their disinterestedness to wrong them. Those which tell the faults of statesmen most boldly, and are most zealous for the popular interest, are always very properly the best supported in return by the public. What a pity it would be if these sagacious and ingenious men, by whom alone the lamp of human knowledge is now sustained, were to be themselves left with an empty cruise! I am afraid, in that case, both their own cruises and the lamp of human knowledge would soon die out.

Having decided that the knowledge of passing events is the only knowledge in the world, the newspapers are surprisingly vigilant to let nothing, however small, escape them. Far from confining their attention to state affairs, they think nothing beneath their notice, even should it be the breaking of a poor man's leg upon a slippery street. If a chimney-sweep fall from a house-top, his bruises are immediately made known over the empire with the speed of lightning, so that his fate is perhaps exciting contemporaneous sighs on the banks of the Thames and amidst the highlands of Ross-shire. If a dissenting minister at eighty pounds a-year has a prospect of acceding to a congregation which will yield him ninety, the invaluable fact is caught up by these public instructors, and published for the edification of the whole of the three British nations. Does a thief break into the back window of a family who have gone to live in the country—does a new actor appear on the boards of a provincial theatre—does butter fall a halfpenny in the pound—does the king ride out an hour before dinner—is a bridge carried off any where by a flood—the newspapers at once seize upon the event, and in a moment make it part of the grand stock of human knowledge. When a great land-proprietor marries, or is blessed with a son and heir, or that son attains his majority, how eagerly the newspapers grasp at the important truth! and at what length, and with what unction, do they chronicle it! When two human beings meet together, and fight for three or four hours, for the amusement of other human beings that look on, then do the newspapers take care that all who were so unfortunate as not to be present shall fully know every thing that took place, not a bruise being left unrecorded. When some small city official gets his neighbours bored into making him a present of a silver snuff-box, as a testimony of their gratitude and esteem, how carefully the newspapers instruct the public as to the mighty fact! When a few gentlemen choose to dine together under some general designation, with what attention do the newspapers note the circumstance—so important to those who were not there—that the dinner was well served, and the wines excellent! When any public body, however trifling, meets together to consult about its procedure, those vigilant instructors send an emissary to hear what goes on, and they would suffer much before they would keep the world ignorant for a single day of what that association means to do. Every thing, in fact, is sure to find a place in these depositories of knowledge, provided that it only be a thing of recent date—for knowledge, it will be observed, is very evanescent, and ceases altogether to be knowledge, whenever it gets the least musty, or, in other words, exceeds in age the space between the last publication of any newspaper and the present.

In their vehement desire of informing the people, the newspapers often take it upon them to advise their readers very strenuously to buy particular books—not that they believe that there is any such thing as knowledge in the books, for there is no knowledge any where except in newspapers, but because the publishers of those books support the newspapers, the only real fountains of knowledge, by giving and paying for advertisements. Thus, in correspondence with the advertisements, which generally appear in a page by themselves, there is always a train of little paragraphs, in which the editor assures the public that the books are excellent: he has not, perhaps, read, or even seen the volumes, but he knows very well that no bookseller who can occasionally advertise, ever publishes a bad book. At the very worst, if a number of people be deceived into buying a few wretched books, and thus cheated of a little cash, it is all in the way of good, nevertheless; for will not the perusal of these trashy volumes just serve to convince them the more effectually that the newspapers are the only publications now worth reading?—an issue eminently conducive to the support of real knowledge. On the same principle as the above, the conductor of a newspaper will pledge his credit for far more equivocal things than books. He will praise the wares of a puffing spectacle-dealer, as if he had the eyes of Argus, and every pair of a different age, to prove the value of each particular kind of the article referred to. He will recommend all the quack medicines that you choose to advertise, as if he had tried the efficacy of every one of them upon some particular disease in his own person. There is no adventurer, or showman, or travelling artist—no stuff, from Warren's renowned blacking to "thine incomparable oil, Macassar," whom or which he will not magnify in any terms that may be desired, if in the first place the party concerned shall prove his respectability, and show his generosity towards the cause of knowledge, by paying some half-crown for an advertisement. He will admit into his pages announcements the most shameless, the most demoralising: the delicacy of females, the morals of youth, may be blighted by the odious page; but what is morality to "knowledge!" Knowledge is now the chief, or rather the only good on earth; and provided that the newspapers, which alone contain it, be supported, society is perfectly safe from every kind of injury.

Take them for all in all, the newspapers are decidedly at the head of mortal affairs in this and every other well-regulated country: pity it is that the gentlemen conducting them should personally hold a rank so obscure, so unimportant, and even in many respects so despised, in comparison with the influence which they exert over society with their pens! Look at one of these mighty and noble men, as he appears in his sheet, pronouncing, with intuitive wisdom, upon the merits of kings, statesmen, authors, actors, artists, and every other sort of public persons—a concentration, in brief, of all earthly talent, taste, and knowledge—a man who makes it his noble ambition to aid in the selling of estates, and blacking, and books, and the thinning of a monstrously superabundant population by quack medicines—a man who, for his sagacity, might evidently make a far better premier than any we have yet known, and whose lightest word, wherever it goes, produces sensations among mankind of the most powerful kind, particularly when (as generally happens) he takes care to say nothing but what mankind already think, or what is pretty sure to square with their amiable prepossessions. Look at the man in this his great ideal character—mark his absolute "*we*"—and then turn to him as he sits, the night before publication, in his humble den, a porter jug at one hand, and a pen in the other! Alas, unhappy man! He is seldom able to live in a style superior to that of a second or third-rate shopkeeper, and, prostrate as mankind are before his written word, his spoken one is rarely so weighty as that of a citizen of two hundred a-year. It is a disgrace to mankind that they should, day after day, imbibe invaluable knowledge from its sole existing sources, and yet leave the sages who create that knowledge in so low a condition that they tremble at the loss of a single subscriber to their papers, and, in fact, are, in the most of cases, the slaves of popular passion and opinion. The nation should make a simultaneous rush to the foot of the king's throne, and implore his royal wisdom for once to do right, by selecting a ministry from the newspaper conductors by rotation, and thereby at once do honour to himself and to the cause of knowledge, save himself from all snarling about his measures, and secure, by the only possible means, the right guidance of the national affairs.

LITHOGRAPHY.

(Second article.)

By Samuel Leith, Esq. Banff.

It has already been shown, in a former article on this subject, that, for a series of years, Senefelder's patience and perseverance, under the most disadvantageous circumstances, were truly astonishing; and we shall now proceed briefly to detail such other particulars in further illustration of the preceding remarks, as may be deemed necessary for completing this part of our subject.

Satisfied as to the originality of his new discovery, Senefelder became anxious to turn it to account, by laying it before the world; and in order to raise the necessary funds for at once effecting this object, we find him, when all other means had failed, offering himself as a substitute for a friend who was then a soldier in the service of the elector of Bavaria, but with his usual want of success; for, on presenting himself at Ingolstadt for the purpose of being enrolled, it was discovered that he was not a native of the electorate, and, consequently, inadmissible to its army. His last hope seemed now to have failed him, and he describes his feelings as being at this time in a state "bordering on despair." However, it was not long ere his prospects began again to brighten a little; and he at length succeeded in publishing, in conjunction with the composer, a collection of music, the execution of which was greatly admired, and which obtained for him the patronage of the elector, and a promise of an exclusive privilege.

About this time, another candidate for the honour of having discovered the new art came forward in the person of M. Schmidt, professor of the Royal College; and although, for a time, the station which this gentleman filled helped to support his pretensions against his less fortunate rival, public opinion by degrees became less divided, and ultimately there prevailed but one belief on the subject.

It was not till after having laboured a considerable time in his new profession, and experiencing innumerable inconveniences from being compelled to execute all his writings on the stone backwards, that he commenced another series of experiments, the object of which was to obviate the necessity of *writing* on the stone, by previously doing it on paper, and then transferring it from the paper to the stone, *reversed*. Some thousands of experiments were made before he was enabled to produce a composition for preparing the surface of the paper suited for all the purposes which he had in view, and it was this property of the new art which more particularly attracted public notice, from the incalculable benefits which it was foreseen would be conferred on all kinds of business when fairly brought into general practice. It was about this time also that he invented the lever press, which added greatly to the comfort and certainty of the operations in the printing department of lithography.

Having at length obtained an exclusive privilege for exercising his art in Bavaria, he did not consider it any longer necessary to keep the process a secret, and it soon spread over the greater part of Germany; but his experience enabled him for several years to outstrip all his competitors in so far as the execution of his work was concerned, although, in every other respect, he seemed to be almost the only one in whose hands the art did not give ample returns both for money and labour. In no other way can this uniform want of success be accounted for, than by supposing, that, while others were making the most of what he had already discovered, he was devoting much of his time to the *experimental* part of the business. This in fact was the case.

About the year 1800, Senefelder went to London for the purpose of establishing himself there as a lithographer, but a few months sufficed to convince him that he had little chance of succeeding in his undertaking; and he returned to his own country, where, on his arrival, he found that many attempts had been made in his absence to deprive him of the benefit of his privilege. Amongst the most forward in this scheme were two of his brothers, to whom he had communicated all the secrets of the art, and it took some time to counteract the bad effects of their ungenerous conduct. Finding that, in his native place (Munich), others were reaping many of the advantages which by right should have been the reward of his own industry, he was induced to go to Vienna, for the purpose of superintending a calico-printing establishment, the operations of which were to be conducted on the principles of the new art; and here, for the space of several years, his talents were entirely devoted to this new undertaking; but, at the end of which time, from a variety of causes over which he had no control, he was again thrown upon the world, destitute of every thing save the resources of

his own genius. It was not till about the year 1809 that Senefelder was extricated from the difficulties of his situation, by being appointed inspector of the royal lithographic establishment at Munich, which at once placed him above the necessity of exercising his profession as a means for gaining his daily subsistence, and enabled him to devote a portion of his time to the improvement of such branches of the art, as, in his former circumstances, he had never found it possible to effect.

In conclusion, it may not be out of place to remark, that, in the case of Senefelder, we have another instance to the many recorded facts in the lives of eminent men, of the successful pursuit of knowledge under extraordinary difficulties—presenting an example worthy of our highest admiration and respect.

BIOGRAPHIC SKETCHES.

ROBERT HERON.

THE life of Robert Heron, a miscellaneous writer at the beginning of the present century, is not one of those examples of positive virtue and good conduct which we generally select for this department of our paper. It forms, however, an entertaining article, and cannot fail to have a good effect *negatively*, as showing the uselessness of talent where it is not guided by prudence, and the misery which must invariably result from an irregular and reckless course of life.

This extraordinary man was born in the town of New Galloway, in the south-west of Scotland, on the 6th November 1764. His father, John Heron, was a weaver, generally respected for his persevering industry and exemplary piety. By his grandmother, Margaret Murray, aunt of the late Dr Alexander Murray, he claimed no very distant relationship to that profound philologist. He was early instructed in his letters under the careful eye of a fond parent, and was not sent to the school of the parish until he had reached his ninth year. He soon became remarkable for the love he showed for learning, and the unwearied anxiety with which he pursued his inquiries after every point connected with his studies. This being early perceived by his parents, they resolved to give him the benefit of a liberal education as far as their means would allow. He had scarcely remained two years at school, when, at the age of eleven, he contrived to maintain and educate himself by mingling with his studies the labour of teaching and writing. From his own savings out of a very limited income, and a small assistance from his parents, he was enabled to remove to the University of Edinburgh at the end of the year 1780.

His hopes of preferment at that time being centred in the church, he first applied himself to the course of study which that profession requires. While attending the college, he was still obliged to devote a considerable portion of his time to private teaching, as well as writing occasional essays for newspapers and magazines, in order to provide for his subsistence. To quote his own words, "he taught and assisted young persons at all periods in the course of education, from the alphabet to the highest branches of science and literature." Being well grounded in a knowledge of the French language, he found constant employment from booksellers in translating foreign works. His first literary production, published with his name, appeared in 1789, "A Critique on the Genius and Writings of Thomson," prefixed to a small edition of the Seasons. It was highly spoken of, and reflected much credit on the judgment and taste of the author. His next work was a version of Fourcroy's Chemistry, from the French, followed by Savary's Travels in Greece, Dumourier's Letters, Gesner's Idylls in part, an abstract of Zimmerman on Solitude, and several abridgements of Oriental Tales.

In 1790-1, he says he "read lectures on the law of nature, the law of nations, the Jewish, Grecian, Roman, feudal, and canon law, and then on the several forms of municipal jurisprudence established in modern Europe." These lectures, he says, were to assist gentlemen who did not study professionally in the *understanding of history*. Though he devoted much time and study to prepare these lectures, he was afterwards unfortunate in not being able to obtain a sufficient audience to repay him for their composition—they were consequently soon discontinued. A syllabus of the entire course was afterwards published. Still the sums of money he continued to receive from his publishers were amply sufficient to maintain him in a respectable manner, if managed with prudence and discretion; but his unfortunate peculiarity of temper, and extravagant desire of supporting a style of living which nothing but a liberal and certain income would admit of, frequently reduced him to distress, and finally to the jail. He might have long remained in confinement, but that some worthy friends interceded; and, on their suggestion, he engaged himself to write a History of Scotland, for which Messrs Morrisons of Perth were to pay him at the rate of three guineas a sheet, his creditors, at the same time, agreeing to release him for fifteen shillings in the pound, to be secured on two-thirds of the copyright. Before this arrangement was fully concluded, melancholy to relate, nearly the whole of the first volume of the History of Scotland was written in jail. It appeared in 1793, and one volume of the work was published every year successively, until the whole six were completed. During that period he went on a tour through the western parts of Scotland, and from notes taken on the road, he compiled a work in two volumes octavo, called "A Journey through the Western Parts of Scotland." He also gave to the world "A Topographical Account of Scotland," "A New and Complete System of Universal Geography," "A Memoir of Robert Burns," besides many contributions to magazines and other periodical works. He was also engaged by Sir John Sinclair to superintend the publication of his Statistical Account of Scotland. He had now acquired great facility in the use of his pen, and, being extremely vain of the versatility of his genius, he flattered himself there was no range in literature, however high, that was not within the scope of his powers. Impressed with these ideas, he made an attempt at dramatic composition, and having some influence with the manager of the theatre, he contrived to get introduced on the stage an after-piece, written, as he says, in great haste, called, "St Kilda in Edinburgh; or, News from Camperdown;"—but as if to verify the adage, "things done in a haste are never done well," so it turned out with St Kilda. Being devoid of every thing like interest, and violating in many parts the common rules of decency, it was justly condemned before it reached the second act.

Our author's vanity must have on this occasion received a deep wound, being present in the house at the time. Overwhelmed with disappointment, he flew to his lodgings, and confined himself to bed for several days. Still blinded by vanity in the midst of his mental sufferings, he imputed the failure of his play to the machinations of his enemies. He therefore determined on "shaming the rogues" by printing. It is needless to say, it neither sold nor was talked of. The most amusing part of this affair was the mode in which he persisted in forcing his production on the public. We shall present our readers with an extract from his highly inflated preface. It commences with a quotation from Sterne's Tristram Shandy. "The learned Bishop Hall tells us in one of his decades, at the end of his Divine Meditations, that it is an abominable thing for a man to *commend himself*, and verily I think so; and yet, on the other hand, when a thing is executed in a *masterly* kind of fashion, which thing is not likely to be found out, I think it is fully as abominable that a man should lose the honour of it. This is exactly my situation." In the following he quotes Swift:—"When a *true genius* appears in the world, you may know him by this sign—that the *dunces* are all in confederacy against him." Yet, though blinded by folly and weighed down by distress, still his filial affections were alive; and although he could not afford his parents any permanent support, he seemed anxious to promote the education of their family; which the following extracts from his letters will sufficiently prove:—

"**I hope by living more pious and carefully**, by managing my income frugally, and appropriating a part of it to the service of you and my sisters, and by living with you in future at least a third part of the year, to reconcile your affections more entirely to me, and give you more comfort than I have yet done. O forget and forgive my follies; look on me as a son who will anxiously strive to comfort and please you, and, after all your misfortunes, to render the evening of your days as happy as possible." And again—"We will endeavour," says he, "to settle our dear Grace comfortably in life, and to educate our dear little Betty and Mary aright." He brought his eldest brother, John, to Edinburgh, to study at the university, with the view of his entering the church; he was a youth of promising abilities, but of weak constitution, and sank into an early grave in 1790. As the other children increased in years, faithful to his promise he brought his favourite sister, Mary, to live with him in Edinburgh to complete her education. His irregularities, and consequent embarrassments, made her situation in town any thing but an enviable one. Her mortifications, however, in this life were not of long duration, as she died at his lodgings in 1798. To a mind of his quick sensibility this was a dreadful shock. Almost frantic with grief at the loss he experienced, he gave himself up to the wildest despair: every unkind action or word he made use of towards her rushed to his distracted memory, until life itself was almost insupportable. Neither the sympathy of friends, nor the consolations of religion, could mitigate his woes. At the same time his means of subsistence became every day more precarious; his literary labours were ceasing to pay, so that, added to his other misfortunes, starvation and a jail were hourly staring him in the face. Shunning as much as possible all his former companions, he might now be seen wandering about the suburbs of the city, with wasted cheek and sunken eye, a miserable victim of want and care. By degrees, however, he was recalled to a better state of mind, when, finding his views not likely to succeed any longer in Scotland, he was induced to go to London in 1799. For the first few years of his residence there, it appears he found good employment, and his application to study being very great, his profits and prospects were alike cheering. In a letter written to his father about the time we are speaking of, he says—

"My whole income, earned by full sixteen hours a-day of close application to reading, writing, observation, and study, is but very little more than three hundred pounds a-year. But this is sufficient to my wants, and is earned in a manner which I know to be the most useful and honourable—that is, by teaching beneficial truths, and discountenancing vice and folly more effectually and more extensively than I could in any other way. This I am here always sure to earn, while I can give the necessary application; and if I were able to execute more literary labour, I might readily obtain more money."

He for a time pursued his literary vocations with an unwearied industry, and there was scarcely a publication then in London of any note but contained some of his fugitive writings. He realized in consequence a good income, but, unfortunately, for no great length of time. His former bad habits returned, and while money continued to flow in, he indulged in the wildest extravagance. Wishing to be thought an independent man of fortune, he would carry his folly so far as at times to keep a pair of horses, with a groom in livery. All this time his pen was laid aside; and until warned of his fate by the appearance of his last shilling, he seemed altogether devoid of reflection. Then he would betake himself to his work, as an enthusiast in every thing, confining himself for weeks to his chamber, dressed only in his shirt and morning gown, and commonly with a green veil over his eyes, which were weak, and inflamed by such fits of ill-regulated study.

In 1806, he addressed a letter to Mr Wilberforce on the *Justice and Expediency of the Slave Trade*. He wrote a short system of chemistry, and, a few months previous to his death, he published a small work called the *Comforts of Life*, which, it appears, met with a ready sale.

The last years of his life were spent in the deepest misery. His friends and associates by degrees deserted him—some offended at his total want of steadiness, others worn out by constant importunities, and not a few disgusted at the vanity and envy he displayed on too many occasions; added to all this, his employers found they could place no dependence on his promises, as he would only resume his pen when urged to it by stern necessity, so that he found, at last, it was with great difficulty he could procure even a scanty subsistence. Deep in debt, and harassed by his creditors, who were all exasperated at his constant want of faith, he was at last consigned to the jail of Newgate, where he dragged on a miserable existence for many months. From that vile prison he wrote the following pathetic appeal to the Literary Fund, which we derive from a most appropriate source, D'Israeli's "Calamities of Authors."

"Ever since I was eleven years of age, I have mingled with my studies the labour of teaching or writing to support and educate myself. During about twenty years, while I was in constant and occasional attendance at the University of Edinburgh, I taught and assisted young persons at all periods in the course of education, from the alphabet to the highest branches of science and literature. I read lectures on the law of nature, the law of nations, the Jewish, the Grecian, the Roman, and the canon law, and then on the feudal law, and on the several forms of municipal jurisprudence established in modern Europe. I printed a syllabus of these lectures, which was approved; they were as introductory to the professional study of law, and to assist gentlemen who did not study it professionally in the understanding of history. I translated Fourcroy's Chemistry twice, Savary's Travels in Greece, Dumourier's Letters, Gesner's Idylls in part, an abstract of Zimmerman on Solitude, and a great diversity of smaller pieces. I wrote a Journey through the Western Parts of Scotland, which has passed through two editions; a History of Scotland in six volumes 8vo; a Topographical Account of Scotland, which has been several times reprinted; a number of communications in the Edinburgh Magazine; many prefaces and critiques. A Memoir of the Life of Burns, which suggested and promoted the subscription for his family, has been reprinted, and formed the basis of Dr Currie's life of him, as I learned by a letter from the doctor to one of his friends; a variety of *jeux d'esprit*, in verse and prose, and many abridgements of large works. In the beginning of 1799, I was encouraged to come to London. Here I have written a great multiplicity of articles in almost every branch of literature, my education in Edinburgh having comprehended them all. The London Review, the Agricultural Magazine, the Universal Magazine, the Anti-Jacobin Review, the Public Characters, the Annual Necrology, with several other periodical works, contain many of my communications. In such of these publications as have been received, I can show that my anonymous pieces have been distinguished with very high praise. I have written also a short system of chemistry, and I published a few weeks since a small work, called the *Comforts of Life*, of which the first edition was sold in one week, and the second edition is now in rapid sale. In the newspapers, The Oracle, The Porcupine, when it existed, The General Evening Post, The Morning Post, The British Press, The Courier, &c., I have published my reports of the debates in parliament, and I believe a greater variety of fugitive pieces than I know to have been written by any one person. I have written also a great variety of compositions in Latin and French, in favour of which I have been honoured with the testimonials of liberal approbation.

"I have invariably written to serve the cause of religion and morality, pious Christian education, and good order, in the most direct manner. I have considered what I have written as mere trifles, and I have incessantly studied to qualify myself for something

better. I can prove that I have for many years read and written one day with another from twelve to sixteen hours a-day. As a human being I have not been free from follies and errors; but the tenor of my life has been temperate, laborious, humble, quiet, and, to the utmost of my power, beneficent. I can prove the general tenor of my writings to be candid, and ever adapted to exhibit the most favourable views of the abilities, dispositions, and exertions of others. For the last ten months I have been brought to the very extremity of bodily and pecuniary distress.

"I shudder at the thoughts of perishing in a jail.

"92, Chancery Lane, Feb. 2, 1807. (In confinement."

The life of this accomplished writer was now fast drawing to a close. With a mind bowed down by want and despair, and a body emaciated from increasing disease, he was incapable of farther exertion; and being removed to an hospital as his last and only hope, in one week after his entrance there he breathed his last, on the 13th of April 1807, without a friend to console or assist him. Thus perished Robert Heron in the prime of life, with talents and acquirements of a very rare description, which, if governed by prudence, were eminently calculated to gain for him an honourable independence in the world. It is difficult to estimate the true depth of his genius by his miscellaneous publications in prose; his style was of a mixed description—sometimes pompous and declamatory, at other times chaste and elegant. But it must be considered he was seldom allowed the choice of a subject, being all his life under the dictates of a publisher. He composed with great rapidity, and seldom made any corrections but in his proof sheets. His appearance was at most times impressive and dignified; his figure above the middle size, stately and erect, and his countenance had a benevolent expression, though pale and care-worn from study and confinement.

With all his faults he had still many redeeming virtues, and, above all, a strong sense of the respect which is due to religion and morality; but he committed the fatal error of being more a lover than a practiser of virtue, and his memoir affords a striking instance of the impossibility of shielding genius from poverty and disgrace when blinded by passion or perverted by eccentricity.—*Scottish Biographical Dict.*

MOO-WAT-TIN.

Some part of the continent of New Holland was discovered by the Dutch in the year 1616, but little was known respecting it or its inhabitants till 1770, when the eastern part, which has since been called New South Wales, was discovered by Captain James Cook, the celebrated British navigator. The climate of this extensive island or continent is temperate and healthy. Frost is rarely known to produce any effect on vegetation: plants and shrubs attain a great degree of perfection; they are all evergreens, blooming at all seasons of the year, and, like the woods, display an astonishing luxuriance and magnificence: the level parts, or plains, are fertile and well watered: the hills are covered with lofty trees, their trunks closely interwoven with underwood: the precipices are tremendous; and, except where European industry has commenced, the country is an immensity of wilderness and exuberance, which the hand of nature alone could display.

The natives of this climate are slight made, from five feet four to five feet nine inches high, with projecting brows, broad noses, wide mouths, and thick lips; hair short and curly: altogether, their appearance is preferable to that of the African, yet inferior to that of the European. They are such strangers to cleanliness, that the true colour of their skin is rarely to be seen: it is, however, of a rich chocolate colour: some of the females are considerably lighter than others. Many of their ceremonies are discontinued, such as extracting the two foremost teeth from the right side of the upper jaw of the males, at the age of puberty, and the amputation of the little finger of the left hand of the females at their birth. When scarification is used, it is performed by cutting two lines through the skin, parallel to each other, and stripping off the intermediate skin: this operation is repeated till the flesh rises above the surrounding parts; it is then permitted to heal, and is considered very ornamental. Their expertness with the spear is remarkable: they construct this weapon of the stem of the yellow gum-plant, which often grows ten or twelve feet high; this is polished with great care, and barbs of shell or bone are inserted, five, six, or seven inches from the point, and each variety of spear has its name. To impel the spear with increased velocity, they use a short stick, with its end a little hooked, to fit a hollow formed in the base of the spear.

When the native is in the act of launching his spear, this stick is held firmly in the right hand, the finger and thumb supporting the spear in a line above it; the left hand directs the elevation; and instantly the aim is taken, the spear rushes on its object. It is usual for them to bring down a bird, or an opossum, at a distance of sixty yards! The natives are dexterous in taking the kangaroo, of which they are very solicitous, because the size of the animal affords a plenteous repast; it is found amid high grass or underwood, but so timid, that it is with great good management approached near enough for a spear to be thrown with effect. The method by which the natives take the opossum, kangaroo-rat, flying squirrel, and various smaller animals found in hollow trees, is always attended with success. One of the party ascends the trunk to the upper outlet, and there waits with his club raised, while others below place burning reeds or grass to the lower opening, the smoke of which compels the animals to attempt an escape, in which they are dispatched by the club above, or by the spears below. The blue gum-tree, in which these animals often take refuge, affords the native scope for dexterity by the means he must adopt to ascend. The shaft of this tree will measure forty or fifty feet of smooth surface. His first and second notches are cut as he stands on the ground; when he is going to ascend, his hatchet is held in his mouth, his toes and fingers being inserted in the notches as his ladder: then he cuts a notch above on the right for the foot, on the left for the hand, alternately, raising himself from one to the other with surprising agility. The branches of the tree being gained, the animals are taken, or, if driven from the tree, are speared by his companions below. Catching fish with the hook and line is generally the occupation of the females. The hook is made with infinite labour from the pearly part of shells, but not barbed. The lines are made from the tough inner rind of trees, bruised with a stone until fibrous; the finer threads are then twisted into strands, and joined to the required length. The canoes are constructed of the bark carefully separated from the tree, securely fastened at the extremities; stretchers regulate the different widths, and the whole is cemented with gum. These canoes are managed by the natives very dexterously: both men and women are expert swimmers. When the men fish, they take an instrument which can be increased by joints to any manageable length, having at its point several prongs all barbed; with this, prepared to strike, one man lies across the canoe, with his head beneath the water; the other man, balancing by projecting himself on the opposite side, they rarely fail to secure a fish that glides within the striker's reach. Should a fish be speared too large to be hauled into the canoe, it is directly paddled into shallow water, and necessary assistance procured.

Notwithstanding the seeming facilities for obtaining food, the natives are frequently driven to such extremities as to satisfy their hunger with a species of worm or grub, fern roots, and berries of various plants. They have no idea of providing for the morrow, but eat so long as there remains any food, and then, stretching themselves in the sun, sleep till hunger calls them again into action. A branch of a species of fir is always to be found burning with every party, because they have great difficulty in recovering fire, should the fir stick be extinguished. Their amusements are few: amongst them dancing holds no distinguished place, for they have no regulated steps, no expression, no character, unless the imitation of the kangaroo may be called *a kangaroo dance*, in which all their actions appear to be the result of hilarity alone. When a number of the natives are assembled, an individual will start from amongst the others, leaping, bounding, and throwing his arms about in violent gesticulation and antic positions, till, from fatigue, he can stand no longer. Meanwhile, others have been singing songs, commencing at the top of the voice, the modulations lowering as long as the breath will permit. The lungs are then inflated with considerable noise, and the modulations repeated till hoarseness renders farther articulation impossible. On these occasions, the natives ornament themselves with red and white clay, by stripes on the forehead, circles round the eyes, waving lines on the breast and arms, and spots on various parts of the body.

On their warlike expeditions, they stripe the body with white clay in such a manner as to represent a skeleton. The head is decorated with grease, and covered with white down, feathers, and shells. On these occasions they are equipped with their best spears and shields; and though each tribe has its chief, instances have occurred where a great body of men have placed themselves under the direction of a youthful leader, not more than eighteen or twenty years of age, obeying him implicitly, because his previous conduct had evinced remarkable vigour of body, or intrepidity of mind, characteristics which qualified him for the highest honour and marked distinction. The skill in the use of the club, and the dexterity in throwing the spear, are their greatest acquirements. Agility in attack or defence, and the fortitude with which they endure sufferings, are first among their concerns of life, and confer on the possessors the greatest superiority. Injury or insult is ever resented on principles of retaliation. In their single combats, attention to points of honour is observed, and animosity ceases when satisfaction is obtained. When a native has selected a wife, who is generally of a different tribe, with the greatest secrecy he steals upon her when unprotected, stupifies her with blows, and drags her violently to a place of security. The females are indeed treated with great barbarity: instances have occurred where a native has speared his wife for an imaginary infidelity, and she has been left to perish without the least concern being shown by any of the tribe. Their attachment to savage life is unconquerable: wherever the colonists establish themselves, the natives retire. They have an utter abhorrence to restraint of any kind: no reward can induce them to prefer domestic enjoyment to roving in their native woods and dells. Their indolence is equalled only by their heedlessness; at night they will supplicate for a covering, and cast it from them immediately the sun has risen. The idea of their being the original possessors of the country has long since ceased to be acted upon, yet there are evidences that the knowledge of it is retained with an intensity of feeling.

Two instances have occurred of natives having been brought to England—one, whose name was Be-ne-long, in 1793, another in 1811, whose name was Moo-wat-tin. The general conduct of these men was so similar, that the particulars relating to the last-mentioned individual may be sufficient to show the character and disposition of both, perhaps of all. Moo-wat-tin was a chief, and, though acting occasionally as a servant while in England, never forgot a seeming consciousness of importance. Moo-wat-tin spoke English so well as to excite surprise at the power with which he would use the monosyllables. He became an object of great curiosity to many, and was closely observed during several visits he made with the gentleman who brought him to England. On some occasions ladies were of the party, who were pleased with the decorum, or it may be said, the politeness with which the savage chief from New South Wales behaved. At the dinner-table he was desirous to oblige others, by passing what might be required; was never confused, but acted as though he had been accustomed to the routine of mixed society. He ate and drank very moderately, preferring sherry to any other wine, of which he never took more than three glasses. It was supposed he had received directions for his conduct, or that he was merely an imitator of others; however this might be, his behaviour was such as to command approbation. He was particularly pleased at hearing a lady sing "No, my love, no." He sat with strongly marked expressions of attention and delight, and when asked to sing, consented with a smile. His articulation seemed indistinct, the sounds having great similarity to each other, as, rah-rah tah, wha-rah rah, bah-hah tah-rah hah. The tune was occasionally changed; the ditty was divided into three parts or verses; the latter was particularly hurried and exulting. On being requested to put this song into English, he replied, "not well to do; but first we take fish, next take kangaroo, then take wife:" the particulars he declined translating. He always smiled at being waited upon by the servant, yet instantly resumed the knowledge that he was one of the company. He slightly bent when any attention was shown to him; and though numberless questions were put to him, he always replied with an evident desire to gratify, and, in his endeavour, never evinced the least impatience. He expressed great surprise at the extent of London; thought there were too many houses; trees were much wanted; could not imagine how all the people got food; thought the weather was "*sower cold*;" clouds too near the ground; horses fine, the men strong, the women beautiful; said none of his tribe would believe him when he told of what he had seen; that it would be of no use to take any thing to them except they could eat it; declared he would spear a native who had hurt a *woman*—this was expressed with powerfully-marked ferocity—and while one of the company was endeavouring to dissuade him from such an act, he sat with his hands grasping each other between his knees, his eyes bent on the ground, his teeth visible from an evidently assumed smile; after a pause he started, saying, "I *must* spear him, he hurt my *mother*." This was found to be a painful subject, and was discontinued; but it was some time before his emotion subsided. He seemed to appreciate the value of such trifling presents as are called keepsakes, and has been often heard to call them by the names of the donors. When the time arrived for him to sail, he made the round of his intimacies, and appeared to feel mental agony at separation, uttering, "Never forget, never forget." Moo-wat-tin was deemed by some persons a bright specimen of the natives of New South Wales. His observation was remarkably keen: a curved brow would distress him, a smile would elevate him, but a grasp of the hand enraptured him; by it he seemed to become one of a society amongst which he was anxious to be acknowledged, and which he strove to become by every means in his power. Although Moo-wat-tin might have been tutored to some extent, and though much may be attributed to his habit of mimicry, yet the tenderness and understanding he has so often displayed must have been the dictations of his own natural goodness of heart. These particulars are perhaps dwelt upon more than may seem necessary, the subject being so insignificant as a *savage* from New South Wales; yet he produced in the minds of many, who observed him while in England, very favourable impressions. They could not imagine him incapable of receiving the highest degree of cultivation.

The gentleman with whom Moo-wat-tin came to England had been a free settler under the auspices of the late Sir Joseph Banks. He remarked to some friends while here, that, during an intercourse of twenty years with the natives of New South Wales, he never saw an act or circumstance that partook of indelicacy. All other observances in well-regulated society were disregarded, or perhaps unknown to this inferior race of beings.

As in the case of his predecessor Be-ne-long, Moo-

wat-tin, for some time after his return to New South Wales, retained the manners of a European. He treated those of his tribe with the greatest disdain, and seemed to cultivate a friendly intercourse with the free settlers; but he possessed no habits of industry, and nature could not be subdued. Liberty amongst his native woods and wilds had charms that rendered irksome the kindness of strangers, and dulled every sense of the superior enjoyments of civilization. He returned to his original pursuits, to a state of nakedness and of precarious existence, and has rarely been seen since by any of the settlers in the colony.

SCRAPS IN NATURAL HISTORY.

THE COW-TREE.

Mr Laet was the first person who made known in Europe one of the most curious vegetable productions of the equinoctial regions—a tree which yields a kind of milk entirely analogous to that of a cow, and which, for that reason, has been called cow-tree. This singular juice, on account of its similitude to the milk of animals—in the place of which Baron Humboldt has seen it used for every domestic purpose on the farm of Barbula—has been admired by every traveller.

This vegetable milk possesses all the physical properties of the milk of animals, only it is a little thicker, and mixes easily with water; it also becomes yellow, and thickens on the surface like cream. When boiled, it does not coagulate, but a thick yellow pellicle is formed on the surface. Acids do not form with this milk any coagulum, as with that of the cow.

If the juice of this valuable tree is so pleasant and nutritive to the natives, how much more grateful must it be to the traveller who penetrates to these high mountainous regions, when exhausted by fatigue, hunger, and thirst! On the road from Patito to Puerto-Cabello all the trees of this species which are met with exhibit numerous incisions, made by travellers, who anxiously search for them during a journey through these parts. But it is not for this pleasant and nutritious fluid alone that the cow-tree is valuable; because nature, ever bountiful, has given it a doubly useful property; for, besides the fibrin, it likewise contains in abundance an exquisite kind of wax, which may be extracted with great facility.

The cow-tree appears to belong to the family of *Sapotæ*, and is plentiful on the road from Ourmase to the north-west of Maracovy, on the northern declivities of the Andes, in South America. It does not, however, appear to be peculiar to the Andes on this side of Caraccas, as it is said to be equally luxuriant in Choco.

This milk, when exposed to the action of the air, is altered, and acquires an unpleasant smell similar to that of sour milk; and a pellicle is formed on the surface, which, triturated with caustic potash, exhales ammonia. If some drops of an acid are added to this milk, it may be exposed to the air for a long time, without any alteration; if kept in a bottle with a crystal stopper, it does not decompose, but becomes only thicker; and if a bottle of water is added to this milk, it regains all its properties. In this manner it may be preserved for a considerable time. When this liquid is put on the fire, it presents exactly the same appearance as cows' milk, a pellicle forming on its surface, which prevents the expansion of aqueous vapours.

By repeatedly boiling this vegetable milk with alcohol, a white fibrous substance is produced, possessing the same properties as common fibrin; and although it may appear singular to meet, in a vegetable product, a substance which has usually been considered as peculiar to animal matter, it nevertheless does not differ from it in any thing; and although not identical with the fibrin extracted from animal matters, it seems to have the same relation to it as vegetable albumen has to animal albumen.

Recently a substance has been extracted from the fresh juice of the *Carcèa papaya*, which appears to be similar to that from the milk of the cow-tree.

SPIRITUOUS LIQUORS DERIVED FROM TREES.

Among the trees of India we observe the mowah, or *Bossia lutyræa*. It attains the height of an English oak; the beauty of the foliage and flowers makes it very ornamental to the plains; and its wood is precious on account of its being capable of withstanding the depredations of the white ants. The flowers of the mowah are dried, and are much used for acidulating dishes, and especially for the distillation of arrack. They give a great degree of strength to this liquor, and arrack made with these flowers is distinguished by the name of *mowah arrack*. In a favourable season, a good mowah tree produces from two to three hundred pounds of flowers. A thick oil-like butter is obtained from the fruit, and used for domestic purposes.

The barb, or pamyra, grows upon the banks of the Nerbuddah, and other rivers of the Guzzerat. A good tree of this species furnishes daily forty-three quarts of tars, or palm wine, for which a pound of *gaggaria*, or coarse sugar, may be got. The sugar-cane is cultivated in several parts of this country; but in place of manufacturing sugar from it, they are contented with selling daily in the market the canes, of the juice of which the Hindoos are very fond.

The celebrated Danish chemist, M. Oerstad, shows that, of all the fruits which grow in Denmark, the apple is that which, together with a good quantity of sugar, produces the drink approaching nearest to wine.

The sap of the trunk of the birch is, of all vegetable substances, that which furnishes the best means of imitating champagne. This wine is adulterated in London and Hamburgh, in the manufactories, with different sorts of berries, and especially with whortles.

THE VARNISH TREE.

This tree has been termed by botanists the *Stagmaria verniciflua*. It is a native of the East Indian islands, and also Sumatra, and grows to a considerable size. Its wood, Dr Jack says, is of a fine dark colour towards the centre, and lighter coloured near the circumference. From the bark is exuded a resin, which is extremely acrid, and, applied to the skin, causes excoriations and blisters. The natives of these islands consider it dangerous to handle any part of the tree, and even to sit or sleep under its shade. This resin, on exposure to the air, soon assumes a black colour, and becomes very hard and durable. It is collected and employed as a varnish, and sells for this purpose at a very high price. The celebrated naturalist Rumphius, who flourished about one hundred and thirty years ago, was of opinion that this was the tree which yielded the celebrated Japan lacquer, or varnish, and he considers it the same with that of Siam and Tonquin. Loureiro, however, who had better opportunities of observing the latter, represents the varnish of these countries as the produce of a different tree, which he has described under the name *Augie*. The varnish of Siam and Cochin-China is probably the best; but that of Celebes and Java—which is the produce of this tree—is also employed for the same purposes, and cannot be much inferior, as it bears a high price.

SAYINGS OF THE ANCIENTS.

When Ptolemy the Second, king of Egypt, looked forth one day from his palace window, afflicted as he was at the time with the gout, the consequence of his luxurious indulgences, and distracted with kingly anxieties, he observed a multitude of his poorer subjects reclining in festal ease on the sandy banks of the Nile—"Miserable fate," said the monarch, "that my fate hath not allowed me to be one of them!"

Anaxagoras, the Clazomenian philosopher, and preceptor of Socrates, being asked for what purpose he conceived he had come into the world, answered, "To see sun, moon, and stars!" The same philosopher, being utterly negligent regarding the politics of his town of Clazomene, was twitted for his indifference on that subject by some one of his more zealous fellow-citizens, who asked him whether he entertained no concern for his native country? "For my country," replied the sage, "I have always a great concern. My native city," pointing to the heavens, "is perpetually the subject of my thoughts."

Chilon, the sage of Sparta, inquired of Æsop what was Jupiter's employment—what was his regular daily business in the skies? "To humble those that are elevated, and elevate those that are humble," said the fabulist.

Anacharsis, though a Scythian, uttered sentiments as beautiful as those of Plato himself. Among his fine sayings is the one—"The vine bears three grapes: the first is that of pleasure; the second is that of drunkenness; the third is that of sorrow." A certain Greek poet, in a very ingenious distribution, gave the first bowl, or crater, to the Graces, Hours, and Bacchus; the second to other heathen deities; the third to Mischief.

When Mark Antony was fast fleeing from his conqueror, after the battle of Mutina, one of his acquaintances gave as a reply to some person that inquired of him what his master was about, "He is doing what dogs do in Egypt when pursued by the crocodile—drinking and running."

Crœsus, king of Lydia, who felt presumptuously proud on account of his power and his riches, had dressed himself one day in his utmost splendour of apparel and royal ornament, and, seating himself on his throne, exhibited his person to Solon, as comprehending within itself the substance and sum of all worldly glory. "Have you ever beheld," said he to the Grecian sage, "a spectacle more august?" "I have," was the answer: "there is neither a pheasant in our fields, nor a peacock in our court-yard, nor a cock on our dunghill, that does not surpass you in glory!"

THE PROSE STYLE OF POETS.

Mr Robert Pollok, a Scottish poet, while a student of theology, once delivered a trial discourse before the Secession Divinity Hall, Glasgow, the subject of which was SIN. His manner of treating it, in the opinion of his fellow-students, was rather turgid, and at those passages which they considered to be particularly outrageous, they did not scruple to give audible symptoms of the amusement they derived from Mr Pollok's high-flown phrases; at last one flight was so extravagant that the professor himself was fairly obliged to give way—and smiled. At this point the young preacher was just upon the point of a climax expressing the dreadful evils which sin had brought into the world, and he closed it with the following remark: "And had it not been for sin, the smile of folly had ne'er been seen upon the brows of wisdom." This anecdote is related upon the authority of a person who was present; but it may be remarked that, perhaps, if Mr Pollok's discourse had been listened to with that decorum which the gravity of the occasion demanded, it might not, to an unprejudiced auditor, have seemed deserving of the derisive reception it met with; but when the speaker became sensible that his compeers were making merry at his expense, it must have produced in his manner a degree of confusion, or perhaps of vehemence, by which language and ideas, in themselves not inappropriate, might be rendered ridiculous. It is also to be kept in view that Pollok was not popular among his fellow-students; so that they may be supposed to have been on the watch for an opportunity to testify their dislike of him.

The incident is a curious one, if it were for nothing but because a somewhat similar one—similar at least in as far as its indication of the bent of the young men's minds is concerned—is related of two other poets, at the same stage of their career. "One of his fellow-students," says Sir William Forbes, in his *Life of Dr Beattie* (p. 19), "has informed me that, during their attendance at the Divinity Hall, he heard Beattie deliver a discourse, which met with much commendation, but of which it was remarked by the audience, that he spoke poetry in prose. It is told in the same manner of Thomson, who had also been a student of divinity, that when he produced as a probationary exercise the explanation of a psalm, the professor reproved him for speaking a language that would be altogether unintelligible to a popular audience; which so disgusted Thomson with theological pursuits, that he resolved to betake himself entirely to the cultivation of his poetical talents, by which he afterwards rose to such distinguished eminence."

The reader is requested to observe, that the whole of the present number of the Journal is the composition of the Editors, or of authors whom they employ, none of the articles having ever before been in print, with the exception of the Biographic Sketch, which is abridged from a work edited by one of the conductors of the present publication. This notice as to the originality of the articles of the Journal is found necessary in consequence of an impression which certain illiberal newspapers are assiduous in conveying to their readers, to the effect that the matter of the present work is week after week borrowed without acknowledgment from other works, and that its cheapness is solely owing to this supposed system of plagiarism. So far from this being the case, the Editors systematically refuse the gratuitous contributions which many able and ingenious persons throughout the country are in the habit of offering to them—having found it necessary, in order to accomplish the objects they have in view, to employ either their own pens, or those of some other practised writers, who, acting under their express direction, shape their labours to the peculiar nature and purposes of the Journal. In every case, they repeat, where quotation is not made—and these cases are now very rare—the articles are compositions prepared expressly for the work.

A fortnightly sheet, similar in appearance and price to the Journal, is published under the title of "CHAMBERS'S INFORMATION FOR THE PEOPLE," of which the following ten numbers have already appeared:—

1. EMIGRATION TO CANADA, being a complete body of information on that country for the use of Emigrants, and precluding, in a great measure, the necessity of consulting other works.
2. HISTORY OF THE ISLAND OF GREAT BRITAIN, down to the commencement of the Civil War—to be continued. The object of this sheet is to afford such a view of British History as may be suitable to the tastes and opportunities of the people at large.
3. HISTORY OF MANKIND—a view of the progress of the Human Race, and of the peculiarities of the various divisions of Mankind.
4. EMIGRATION TO NOVA SCOTIA, NEW BRUNSWICK, CAPE BRETON, &c.
5. EMIGRATION TO THE UNITED STATES.
6. ACCOUNT OF THE GLOBE—a complete view of the internal and external Structure of the Globe, comprising all the discoveries of modern geologists.
7. THE COTTON, WOOLLEN, SILK, AND LINEN MANUFACTURES—a condensed account of the progress and present state of those essential branches of our national industry.
8. AN ACCOUNT OF THE HUMAN BODY, being a Popular Sketch of the Physiological Structure of Man.
9. STORY OF THE FRENCH REVOLUTION.
10. EMIGRATION TO NEW SOUTH WALES.

Articles are also in preparation on a variety of subjects generally interesting to the people, and will in due course appear. Every article is a *careful original composition*, generally the production of the Editors themselves, or of some other literary gentlemen of established character in the departments respectively assigned to them. In Edinburgh, as in the case of the Journal, it is regularly left every alternate Wednesday at the houses of subscribers, and it may be had of every bookseller and newsman throughout the United Kingdom.

LONDON: Published, with Permission of the Proprietors, by WILLIAM ORR, Paternoster-row; G. BERGER, Holywell-street, Strand; A. DOUGLAS, Portman-street, Portman Square; BANCKS & Co., Manchester; WRIGHTSON & WEBB, Birmingham; WILLMER & SMITH, Liverpool; W. E. SOMERSCALE, Leeds; C. N. WRIGHT, Nottingham; WRIGHT & BAGNELL, Bristol; S. SIMMS, Bath; J. JOHNSON, Cambridge; PENNY and Co., Exeter; J. PURDON, Hull; G. RIDGE, Sheffield; H. BELLERBY, York; J. TAYLOR, Brighton; and sold by all Booksellers, Newsmen, &c. in town and country.

An Edition is published by W. and R. CHAMBERS, Edinburgh, for circulation throughout Scotland; and another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, 9, Upper Sackville Street, Dublin, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS, and stereotyped by A. KIRKWOOD, Edinburgh.

Printed by BRADBURY and EVANS, Bouverie Street, London.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 78. SATURDAY, JULY 27, 1833. PRICE THREE HALFPENCE.

"HE THAT THOLES, OVERCOMES."

ONE can go nowhere without gaining wisdom, if he only hold himself open to receive it. The above sagacious aphorism is inscribed, in contracted and hardly intelligible characters, over the door of a very ancient house in the West Bow of Edinburgh, a street where we might expect to meet nothing now-a-days but spectacles of misery and vice.* He that tholes—that is, he who endures without flinching—overcomes: he who, however sorely afflicted, however sorely tried with calamity, suffers his pains with patience and manly fortitude, triumphs over them, and is in reality the same as if it were not his fate to be so tried. How profoundly philosophical is this maxim, or, to use a French phrase literally, which is applied metaphorically to something slightly different, this wisdom of the streets!† What, we cannot help reflecting, must have been those personal circumstances which induced the man who built this house—probably a burgher of the sixteenth century—to inscribe his property with a phrase breathing such a spirit! Whether he conceived it in his own mind, or adopted it from some other source, he must have been himself, one would suppose, a singular and conspicuous instance of the victory which patience ever achieves over all trials, those of the body as well as those of the mind. Perhaps the acquisition of the wealth which enabled him to build this house, was the result of some remarkable exertion of his powers of endurance; and, looking upon the house as the best monument of his achievement, he thus inscribed it in a modest spirit of triumph, and with the hope, perhaps, that a maxim enforced by such a story as his would occasionally prove a support to the sinking spirits of future sufferers. If such were his views, they have long been frustrated by the treachery of time; for not only is the history of this man now unknown, but the inscription is so obscure, both in language and orthography, that it must be a mystery to almost all who are in the habit of seeing it, notwithstanding that its sense could never have been so useful or requisite as in these latter times, when the house and all around it are inhabited by an infinitely poorer class of people than at any former period. It is for the purpose of reversing its fate, and rendering it as clear to the world as ever, that we have taken notice of it in this place.

At all periods of life we are liable to troubles, some of which we can partly obviate and alleviate by prudent management, while others are so entirely beyond our control, that we can neither prevent them from coming upon us, nor obtain relief from them after they have taken effect. The commercial schemes, which we have planned with the most guarded caution, and watched over with unremitting care, may be blasted by some casualty, either unforeseen, or which we had to lay our account with, at the commencement, as incidental to the mode which had been assigned to us of gaining our daily bread. Hopes still tenderer to the heart may be crushed and blighted: beings who were dearer to us than our own life may be reft from us by sudden or by slow decay: sickness may befall ourselves, or our frames may be stricken with some of those severe calamities which medical science can only look upon and despair. To such and to many other calamities are we, in this imperfect state of being, daily and hourly exposed. Let us never forget, however, that all affliction is capable of being increased or diminished by the way in which we receive it; the weak suffering much additional distress from the reverberation of pain, so to speak, within their own agitated minds, while those possessed of fortitude, like travellers who stare a beast of prey out of countenance, turn off a great part of the danger by boldly encountering it. Do not yield to evils, says the classic maxim, but go the more daringly against them. In fact, the philosophy of this question is the same as that of a great battle, where there is always less aggregate danger to the party which stands firm than to that which gives way; the cowards being always cut down ingloriously in the flight. It may be said that many are not so framed as to encounter evils with firmness; but this is liable to great error. No one knows what degree of firmness he possesses till he musters it up by an exertion of the understanding. If he do not attempt to muster it up, he may sink needlessly into despair, and, consequently, into greater evils, for want of that which he really has. There can be no doubt that in these cases the will can be forced, if we will only try; for (if we may be allowed such an illustration) there is hardly any instance of a malefactor, who, timid in ordinary circumstances, did not display the most perfect resignation to the last award of the law, when assured that there was no hope of its being reversed. If the worst of evils can call up this firmness, why should we permit lesser distresses to overpower us? It is fairly allowable in such cases, we think, to call in the aid even of vanity, and, seeking applause from our fellow-creatures for the heroism with which we meet our trials, gain that patience of which the reverse is often called up through the same means. But it were better if we could uniformly derive our powers of endurance from an inward and unostentatious constancy of spirit, which, based upon conscious rectitude of intentions, regards calamity as only a trial of the better part of man. And, after all, there is no evil in the world, excepting remorse, for which there is not some immediate, and often a corresponding palliative. The genius of human suffering resembles the serpent, which is said to be always closely attended by another creature, bearing a balsam to cure its bites. As this stern spirit walks over the earth, casting her darts here and there, numberless beneficent genii hover over her path, whose duty it is to pour balm into the wounds which she has made. Wherever there is a deficiency in these remedial processes, it may be supplied by a religious patience, which is always at the command of a well-regulated mind, and the want of which may be described as almost the only calamity that is really to be deplored.

The maxim may be not only enforced in this general way, but there are many special circumstances in human life, and many classes of human beings, to whom its moral might be specially applied. We would particularly instance the young, who, from their ardent and effervescent character, are not apt to have much power of *tholing*. In this large and interesting class of persons, there are many whose natural sagacity and perseverance enable them to bear up with much patience against the obstacles with which almost every young man is tried before he can vindicate his title to consideration and employment. But, on the other hand, many more are of a soft, self-indulgent, and self-admiring character; and if they do not find every difficulty give way at *their* approach, their pride takes offence, they sink back into sloth or into equally fatal indecision, and perhaps are lost for ever. It should be impressed on every young person, that, in general, much must be done, and long delay must be endured, before they can be even put into the way of accomplishing what they desire. There is no "Open Sesame," as they may imagine, to make the portals of prosperity fly open to them; but fortune must be wooed with a solicitude and a patience proportioned to her proverbial character as the most coy and coquettish of all beings, real or imaginary, who ever bore the female form. Far more is done in the world, by negative qualities, than they could suppose. Only hold on—*thole*—living as moderately in the meantime as possible—and it cannot fail that, as others die off, some vacancy will occur into which you will be admitted: or you will gradually be acquiring a preference, and accumulating reputation and respect, by mere *standing*, which is much the same thing. Every one must have observed that the brightest abilities at twenty have no chance against the consolidated reputation which may attend very moderate abilities at forty. This superiority, it is easy to see, has only been gained by *tholing*.

The precipitancy of youth is often shown in a very amusing manner in their affairs of the heart. When the human being arrives at about twenty, he gets dreadfully afraid that the world will run past him unenjoyed. As he grows older, he always becomes the more sensible that there is plenty of time for all the enjoyments of life, and therefore the less eager does he become to grasp them. Hence no bachelor at thirty-six is nearly so much afraid that he will be late in *settling in life*, as the generality of those who number exactly half that amount of years. And hence, after thirty-six, the chances of a bachelor changing his condition—at least in a way that will not excite the ridicule of society—always become less and less. This excessive eagerness in youth ought to be by all means controlled, so far as it does not conduce to real advancement in the world, for it is but too apt to be inconsistent with that patience which, without doubt, is the best part of the battle of life.

* It is necessary, for the sake of the greater part of our readers, to mention, that, in the older part of the Scottish capital, many of the houses exhibit pious inscriptions over the doorways, generally texts of Scripture. The above is of a rare character, being a moral apothegm: it is noticed in "Traditions of Edinburgh," vol. i. 142.

† The French speak of what we understand by the term "common sense," as *le sens qui court les rues*—the sense which runs the streets.

HAMPTON COURT.

IT is a beautiful morning in June; scarcely one little soft white cloud rests on the wide blue horizon; the smoke rising from the great world of houses, after hovering in mid air, is gradually dispersing in an easterly direction; the ladies assure you that the weather is delightful and settled, and that the party is certain to have a most beautiful day to go to Hampton Court. So off we set. One, two, three, four—we are all in the coach; the steps are drawn up, the door closed, and in a minute we find ourselves whirled along towards one of the western outlets of the town. In a westerly direction from London, the roads are excellent and pleasant: the long dull lines of brick streets cease, but detached houses and villages succeed in apparently endless variety for a distance of many miles, as if there were a struggle betwixt town and country for supremacy.

Hampton Court is one of the royal residences of England, and being situated at the distance of only thirteen miles from London, in a very beautiful part of the country, on the north bank of the Thames, it is a fit object of interest to be visited by strangers in the metropolis. In about an hour and a half after leaving town, you enter the village of Hampton Court, which consists of a few houses of brick, large and small, with barracks for horse soldiers; the whole being overhung and environed with tall trees, mostly horse-chestnuts, whose broad green leaves and shadowy recesses give a sylvan aspect to a scene essentially English. After alighting at the "King's Arms,"

where, I have no doubt, you will take care to bespeak dinner against the time you return from your walk through the royal domain, you proceed towards the palace by one of the large gateways, from which, through some fine shadowy shrubberies and open walks, you are introduced to the centre of the grounds, where the royal structure is situated.

The palace of Hampton Court, in external appearance, is a lofty and magnificent structure of red brick, ornamented with pale freestone cornices and edgings to the doors and windows, a row of the latter above the first floor being circular; and the whole contour conveying the idea of a house of William the Third's reign, in which time the edifice underwent nearly a total renovation and a very considerable extension. The palace altogether consists of three grand quadrangles, with open courts, one of which bears a close resemblance to, and I believe formed a model for, the inner court of Holyroodhouse at Edinburgh. Around this court are piazzas, with stone pillars, and from which covered way, passages ascend to the apartments above. The grand staircase is one of the widest any where to be met with. The walls and roof are covered with continuous paintings of emblematic figures, illustrative of allegorical subjects, as well as representing the Roman Cæsars in their proper costume, but so gross and stupid in their appearance, that they would disgrace the walls of the meanest dwelling.

The visitor now enters a suite of lofty and large apartments, mostly panelled and floored with oak, and containing hardly any furniture. The only seats are a kind of footstools; the ample fire-places are destitute of grates, but in some the ancient fire-irons, called *dogs*, for the support of logs of wood, are still extant. What are called the "presence-chambers," or rooms in which levées are held, are decorated in better style, with wide canopies over the chairs of state. The beds in the royal sleeping apartments are lofty structures, with coverlets, hangings, and other furniture, of rich satin or silk, and velvet, of different colours. All these, and other apartments shown to strangers, form a suite going round the building, each room entering from the other without the intervention of passages, that is, not reckoning the numerous secret and partly concealed doors leading to various back stairs and private entrances.

You are first introduced into the guard-room, the walls of which are ornamented with ancient warlike instruments, and paintings of a number of English admirals, by Kneller and Dahl. In the next apartment are seen portraits of various beauties of the court of England, painted also by Kneller, who has here depicted several lovely countenances, though a sameness runs through the whole, and none are so striking as to leave any impression. In the third room is seen what we esteem the finest painting in the house—a portrait of Charles the First on horseback, by Vandyke—and which ought to be seen, in order to have a just appreciation of that great master's admirable style. There is also an excellent painting of Bandinelli in his studio, by Corregio. The third room, or audience chamber, has also some good pictures; among others, a painting of the family of Louis Cornaro, a person celebrated for his extraordinary temperance. The picture, which is from an original, by Titian, shows Cornaro and three generations of descendants, who appear in the act of adoration at a shrine. There are likewise portraits of Titian and his uncle, done by Titian himself, and a spirited battle piece, by Julio Romano.

The fourth apartment, or king's drawing-room, is enriched with an exceedingly fine painting of Charles the First, a whole length, by Vandyke, esteemed the best likeness we have of that monarch. It has been copied and engraved by Sir Robert Strange, a distinguished Scottish artist, who, though a staunch Jacobite and adherent of Prince Charles Stuart in 1745, had the good fortune to be warmly patronised by George the Third. In the next room, or state bed-chamber, the visitor will see a beautiful portrait of Anne Hyde, daughter of Hyde, Earl of Clarendon, and mother of the successive queens, Mary and Anne. The king's dressing-room and writing-closet, and Queen Mary's state bed-chamber, which follow, contain many fine pictures, by Holbein, Sir Peter Lely, Sebastian del Piombo, Louis da Vinci, Albert Duror, and others.

After having traversed these stately and silent halls, the visitor is led out through a long, dreary, ill-lighted apartment, the walls of which are ornamented with what at first sight he may suppose very wretched daubs of painting. Yet these faded colourless pictures are the famous cartoons of Raffaelle—productions whose praises have resounded over the whole civilized world.* Whatever may be the merits of these famous paintings, they are quickly going to decay; and if not restored by applications necessary to preserve them, will ere long fall in tatters from the walls, or at least lose all character as emanations of the mind of him who has been enthusiastically termed "the Divine Raffaelle."†

Hampton Court palace was originally built by Cardinal Wolsey, and a portion of the structure which he reared is still extant in the northern quadrangle. Here was the scene of the humiliation and forfeiture of that favourite of Henry the Eighth, who at this place often held his court, and made it the scene of his Christmas festivities—here Edward the Sixth was born—here were held the masques, and mummeries, and tournaments of Philip and Mary, and Elizabeth—here James the First held his court and famous meeting of controversialists—here Charles the First was immured as a state prisoner, and took leave of his children—here was celebrated the marriage of Cromwell's daughter and Lord Falconberg—here Charles the Second had occasionally his impure residence—here lived William and Mary after the revolution of 1688—and here, till the reign of George the Second, royal courts were sometimes held. In the present day, the private apartments are the residence of certain impoverished ladies of quality, and others connected with the royal household.

In front of the palace, to the south and westward towards the Thames, which flows in a sweep round the domain within a short distance, the grounds are laid out in extensive broad walks and parterres, having an air of courtly grace peculiar to some of the old baronial gardens. There are also various extensive avenues of tall leafy trees, which, in their cool shade, offer an acceptable relief from the glare of a summer sun on the flat gravel walks and borders. Just within one of the outer gateways is a labyrinth, formed by hedge-rows, and, by extending a mile in length in an almost inextricable though regular maze, affords an exquisite amusement to the parties of Londoners who come hither to spend a holiday.

THE OUTCAST,

A TALE.

Such of our Scottish readers as were personally familiar with the transactions and incidents during the late war, may remember a small building that stood at the end of one of the streets of Leith, at the door of which the union jack was seen flying from morning till night. It was the rendezvous of the "press-gang," whilst employed in their revolting occupation ashore, and where they were regularly locked in every night, to prevent the risk of collision between them and the citizens, to whom they were, as a matter of course, particularly obnoxious.

The commanding officer on the station, at the period of the following incident, was a man peculiarly unfitted, by *inclination* at least, for the duties imposed on him in the impressment proceedings, being of a most humane and kind disposition. He was, besides, a native of Leith, where he resided in a house of his own, unless when his presence was necessarily required on board. He had also a private room in the round-house (as it may be termed) above mentioned, where he attended with great punctuality, in order that his presence might prove a check to the brutal and licentious natures of the "press-gang"—the most reckless and desperate characters amongst the crew being, as is well known, always selected for the worse than slave-traffic in which they were employed.

In the above room, then, Captain Gillespie was seated one evening, when he was informed that a gentleman desired to speak with him, and, at his desire, the stranger was introduced. He was evidently a mere youth, slightly and elegantly made, and was very fashionably dressed. Captain Gillespie was particularly struck with the handsome, and, as he thought, feminine cast of his features—a peculiarity that corresponded well with the soft and silvery tones of his voice, when, after considerable hesitation, he stated the purpose of his visit. This was no other than to request that he might be taken on board a man-of-war to serve as a common sailor! Captain Gillespie expressed no little astonishment at one of his tender age and elegant appearance having adopted so strange a resolution, and begged to question him as to his motives for so doing—whether he had reflected sufficiently on the consequences of such a step, the hardships he must endure, and so forth. The youth declined giving any explanation on these points, and merely reiterated his determination of entering the navy. The worthy officer was exceedingly moved at the youth's situation. He was evidently of a superior rank in life, had been carefully and delicately brought up; and his replies showed that he knew nothing at all of the world. The captain, however, secretly felt more compassion than surprise at the circumstance. He knew that instances were then of frequent occurrence, of young men of the very best families, whose ardent and untutored imaginations were blown into enthusiasm by the inflated and high-coloured accounts every day put forth of our splendid naval triumphs, and with heads filled with visions of glory, and hearts with patriotism, leaving all the comforts and elegancies of home behind, little dreaming of the rough ordeal they must undergo in the path to eminence or glory.

Such an instance did the kind-hearted officer conclude was now before him; and knowing from experience all the rough realities of his profession, he endeavoured to persuade the young enthusiast to abandon, or at least postpone, his resolution; but finding all his arguments unavailing, he determined to give him a foretaste, at least, of the sort of company he would have to associate with on board. When the junior officer, therefore, came on shore to relieve him for the night, he ordered him to lock the young man into the same apartment with the rascals of the press-gang; and directed, also, that he should be brought to his house next morning at breakfast time.

The youth accordingly appeared at the appointed hour, and Captain Gillespie saw, at a glance, that the experiment he had tried had not been without its effect, or rather that it had succeeded much beyond what he had intended. In fact, he was shocked at the alteration which he saw in the young man's features since the preceding evening, and almost repented the plan he had put in practice. He shook him kindly by the hand, and then, in as indifferent a tone as he could assume, requested to know if he still adhered to his determination of becoming a sailor. For a while the young man sat mute and rigid as marble, and seemed totally unconscious of the meaning of the words addressed to him, but at last fell on his knees before Captain Gillespie, and in a passion of tears and sobs, so violent as seemed almost to rend his frame, disclosed—what his compassionate hearer had already begun distantly to suspect—that the unhappy young creature before him was—a female!

Captain Gillespie raised the suppliant before him, and endeavoured to soothe her by all the persuasion he was master of, but it was long before he succeeded. When at length she became composed enough to speak, she frankly told her short and simple tale:—She was the youngest daughter of a gentleman of considerable property in a neighbouring county. About six months previous to the indiscretion of which she had been guilty, a young relative, a lieutenant in the navy, had obtained leave for a short visit to her father's house. The young officer had but lately obtained his commission, was consequently in high spirits, and being quite an enthusiast in his profession, could speak of nothing else but the scenes and battles—for he had already seen a deal of hard fighting—in which he had been engaged, depicting them, of course, in the most glowing colours that a young and ardent imagination could suggest. In these details, although listened to with due attention, and perhaps interest, by the rest of the family, the young sailor found none who evidently sympathised, as it were, with his own feelings, but the youngest of his cousins, of whom there were four, all daughters. It was natural, therefore, that he should show a preference to her company in comparison with her sisters, although his predilection arose solely from the vain-glorious pleasure of having a ready, a delighted listener. Any thing like love-addresses he had never once offered to her (and it afterwards, indeed, appeared that his affections were pre-engaged), but his buoyant spirits, and joyous language—his aspirations after naval fame—his handsome and animated countenance, together with the decided partiality he displayed for her society—all these wrought upon the young and simple girl's imagination, to a degree of which she was not herself conscious until he was gone. It was then, and for the first time, she felt how much her happiness was at the disposal of another, and what a dreary blank the world appeared without his presence. Time, perhaps, might have enabled her to regain her equanimity, but she was subjected to distress from other sources. Her father—a cold, austere man, a stern disciplinarian in his family, and who regarded any unbending from that rigid demeanour of stately and ceremonious reserve which was the rule of his own deportment, as alike an infraction of moral propriety and a derogation from his rank—had observed with swelling indignation his daughter's artless admiration of her cousin, and, at the departure of the latter, let loose the full measure of his wrath upon her. Her sisters, too, whose minds were formed on their father's model, and burned, moreover, with spite and jealousy at the preference shown by any eligible and marriageable man to one younger than themselves, persecuted her without mercy. The poor girl's life soon became so wretched, between her domestic troubles and her love for her absent cousin, that she at last determined to fly from her father's house, and follow her lover to sea. So ignorant was she of worldly matters, that, hearing that a "frigate of war" was lying in Leith roads, the name of which she never had heard of except from the lips of her cousin, she simply concluded he must be there, and had accordingly applied, as we have seen, to be accepted as his shipmate.

Such was the simple story of the poor girl, who

* They are called *cartoons*, because they are done on paper, the Latin name of which is *charta*.

† Unfortunately for the visitor of taste, little time is allowed to inspect these and the other works of art. To a pampered and mercenary menial, who does not even deign to look towards the portraits, which she coolly indicates with a key, the trunchcon of her office, the duty of exhibiting this British gallery of paintings seems to have been committed. The visitor is not allowed to depart without paying a certain fee; and such is the rapidity with which party succeeds party, that we would estimate five pounds an hour as the ordinary product. We do not by any means infer by this that a small sum should not in every instance be paid by visitors to this and other public edifices worthy of inspection, but we would humbly suggest that the amount should be appropriated to some beneficiary or really useful purpose. As the custom now is, we find waiting-women, doorkeepers, and others, persons of the meanest capacity, and without responsibility, drawing thousands of pounds a-year, though whether for their own benefit, or that of those who appoint them, we are certainly not aware. We have great pleasure in mentioning, that the palace of the Duke of Buccleuch, at Dalkeith, which contains a good gallery of paintings, is an honourable exception, being freely shown to respectable strangers without the usual extortion of a fee.

seemed overwhelmed with shame and remorse at her folly, and with despair at the probable consequences of it. Captain Gillespie said all he could to console her; promised to write to her father for his forgiveness, which he was sure she would obtain; and tried to cheer her, by saying that her foolish prank would soon be forgotten. But her agitation and distress only broke out afresh. She knew, she said, her father too well to think there was any hope of his mercy; and even if he did forgive her, her sisters would break her heart with their taunts and reproaches. No other course, however, was left to her new and kind-hearted friend; and he accordingly wrote off the same day to Mr Hume (for such was his name), informing him of his daughter's situation, and urging all he could to deprecate his indignation, and palliate his daughter's conduct, which, he assured him, she most deeply repented. He also had the weeping runaway removed immediately to the house of a female relation in the neighbourhood, where every attention was paid her.

Captain Gillespie waited anxiously for a reply to his letter, which he felt quite confident would be in the person of Mr Hume himself, rejoiced to discover and to take back his erring daughter to his arms. The answer, indeed, came punctually by return of post—his own letter enclosed in a blank cover! Captain Gillespie was thunderstruck. His honest and unsophisticated mind was quite unable to comprehend the possibility of such a thing. It presented human nature to him in a light which was perfectly new to him; and he examined his own letter and the envelope more than once, to make sure that the fact was really true. A parent to refuse forgiveness to a penitent child for such a mere act of youthful folly! Was it in the heart of erring man to do it? It was impossible. There must be some mistake—some misconception: he would write again. He wrote again accordingly, repeating what he had stated in his former letter, and adding every thing else he could think of in mitigation of his fair charge's indiscretion. He concluded by remarking—which was the fact—that she seemed fast sinking under her misery; and begged him, as a Christian and a parent, to hasten to her relief, and save her life by pronouncing his forgiveness. It was in vain. His letter was again returned to him as before, with, however, the following laconic note in the envelope:—"Mr Hume knows no such individual as that referred to in the enclosed, and begs that no more communications may be sent to him regarding that individual." Captain Gillespie was staggered at this epistle, and certain suspicions began to arise in his mind. Could she be an impostor? Was it possible that one so young, so modest, and so heart-broken, could be deceiving him with a fabricated story? This he could not bring his mind to believe; but, on the other hand, reckoned it still more improbable that a parent could thus abandon his child to starvation or infamy. Was it that she had been guilty of some worse indiscretion than she had confessed, and was afraid to reveal it to him? He was puzzled for some time what to do or think, but he felt he had proceeded too far to let the matter rest where it was; and he concluded by determining to sift it to the bottom, and that without delay. He immediately made arrangements, therefore, for a day's absence from duty, and set out in a post-chaise for Mr Hume's residence.

He found that gentleman at home, and was received by him with that cold civility of aspect and manner with which he would have welcomed equally his warmest friend and his bitterest foe.

"My name is Captain Gillespie, of his Majesty's frigate the Wasp, stationed at Leith."

"Ah!—pray be seated, sir."

"I have written to you twice within the last week, upon a very painful subject to you, I dare say, Mr Hume. May I ask if you received my letters?"

"I did, sir."

'And pray, sir, may I beg to know what answer you have to make to them?"

"I have already answered them, sir."

"A blank sheet of paper is no answer, Mr Hume."

"There was something more than that accompanying your last returned epistle, sir."

"Then am I to understand that this young person has been imposing on me, and that you are really not her parent?"

"That I *was* her father, sir, I grieve to acknowledge; but I now disclaim the title. She is no longer a daughter of mine."

"Sir!—Why, that is strange doctrine, and quite beyond my understanding. Pray, sir, if she *was* your daughter, how do you make out that she is not so *now*?"

"Her own conduct, sir, is a sufficient explanation of the paradox."

"Then it is her conduct, Mr Hume, that I wish to get explained. Let us understand one another, sir, on that point, before saying another word, and allow me, in the first place, to relate to you the statement made to me by the unhappy girl herself of the circumstances which induced her to act so indiscreetly as she has done."

The worthy officer then recapitulated faithfully the story told him by Miss Hume, softening nothing that related to her own thoughtlessness or folly, but touching as slightly as possible on her statements respecting her father's severe reproaches for her partiality to her cousin, in order not to irritate his auditor. He concluded by asking if the narrative were true or false.

"It seems to be all very correct, sir," was the cold reply.

"And was there no aggravating circumstance connected with it, previous to her leaving your house?"

"None, sir, that I am aware of."

"Had she not previously been guilty of any flagrant misconduct to call down your anger?"

"Never, sir; she had always behaved as a daughter ought to do."

"And, in the name of all that is sacred, do you consider yourself warranted, by this single act of youthful imprudence, to cast off your own child for ever!"

"She cast *me* off, sir, and may, therefore, find a home and a father where she may. But, sir," continued Mr Hume, rising from his seat, "I will not submit to have my conduct questioned by any one, far less by a stranger. If your visit had reference to nothing else but this topic, I have to beg that it may terminate."

"Do you not consider yourself bound, sir," pursued Captain Gillespie, also rising, but with a swelling heart and a glowing cheek—"are you not bound, sir, by the ties of nature, by the mere sense of decency, to take back your erring child to your heart? Should you not reflect, sir, that her present folly may perhaps be owing to some neglect on your part in the training of her young mind, and that it is only the more imperative upon you, from what has now happened, to endeavour to instruct her understanding, confirm her principles, and, by parental lenity and kindness, to make her penitence for her error more lasting and salutary? She is yet pure and unspotted as when she left her mother's bosom. Surely, surely, sir, you make some distinction between folly and crime?"

"You have my answer, sir," was the only reply.

"And do you really mean to abandon her thus to the mercy—to the cruelty and villany rather—of the world, without protection, without subsistence?"

"I see every reason for believing," replied the other, in a significant tone, "that she will be at no loss for either."

The honest-hearted sailor started at the insinuation conveyed by these words, as if a shell had exploded at his feet.

"Sir," said he, unable to repress his indignation, "but for these grey hairs I would strike you beneath my feet! But you say right, sir," continued he, recovering himself; "yon poor mourner shall not suffer for the cruelty of her unnatural parent. While it is in my power, she shall neither want assistance nor protection; nor shall it be my fault if she does not cease to forget that she owed her being to so callous-hearted a monster as you have proved yourself to be!"

And he kept his word. Upon his return home, he imparted the result of his interview to the unfortunate girl in as gentle terms as possible, and begged her, at the same time, to look to him as her future parent. The poor outcast could but sob her gratitude.

Captain Gillespie in a few weeks received orders to proceed to a foreign station; and seeing the daily decreasing health of his charge, he sought out a residence for her in a respectable family in a country town not many miles from the metropolis; and, at the same time, aware of the uncertainty of life in a profession like his, he deposited sufficient funds to secure the unfortunate a comfortable maintenance for life. He set sail, and never saw her more, having, subsequently to his return from abroad, married, and settled in England. The object of his benevolence lived for many years afterwards, but gradually declined, and at last sunk into the grave, there can be little doubt, from the effects of a broken heart. Not one of her relatives had ever deigned to inquire after her—and they even carried their vindictiveness beyond the grave. Upon being informed of her death, her generous benefactor hastened down to Scotland, for the purpose of seeing the last rites paid to her remains, and thought it but his duty to send a notification of the event to her parent, who was still alive; but no notice was taken of the intimation. Captain Gillespie, therefore, laid her head in the grave himself, assisted by a few friends, who were aware of all the circumstances that originated the connection between them, and who pitied the dead no less than they honoured the living.

It was from one of these mourners that we learned the particulars of this mournful tale, which in every part is related exactly as it reached us. In saying so, we are not practising one of those arts by which the writers of narratives, probable and otherwise, so often attempt to abuse the confidence of their readers. The story is positively true, and such, in our opinion, is its chief value, as its publicity in this place may perhaps raise a feeling of repentance in THAT UNNATURAL HEART, hitherto so obdurate. Such an anecdote cannot fail to suggest in every mind a reflection upon the guilt which may occasionally attach to a character, in every common respect held as above impeachment. A man may be, in the sense of the world, respectable, for the discharge of almost every obligation of life—may be, in fact, both moral and religious to the full degree required by the eye of the world; and yet he may, in a mere excess of certain feelings, which, in a moderate degree, might be laudable and beneficial, do that which all ordinary men would shudder at, or, as in the present case, make such omissions of duty, as, in a later and better state of heart, are fit to raise within him the most exquisite tortures of remorse and despair. At the same time, the moral may be fitly drawn by the young and inexperienced, that one false step in life—one trifling aberration from the strictest rules of propriety, may be visited with a degree of punishment which no previous calculation could have anticipated, and which even on general principles of justice may be condemned.

THE DRAMA IN OLD TIMES.

SOPHOCLES.

THE Greek drama seems to have got such an impulse from Æschylus, that, in the very next age, it attained its greatest degree of perfection. During this period, although the country was distracted with the Peloponnesian war, which lasted nearly thirty years, there flourished two tragic writers of the greatest eminence, Sophocles and Euripides, besides Aristophanes, Cratinus, and Eupolis, as writers of comedies, which was a new style of dramatic composition, that now became conspicuous among the Athenians. At the same troubled period appeared Herodotus and Thucydides among the historians, and Socrates among the philosophers. Within the space of about half a century from the time when the regular drama commenced with Æschylus, there appeared Sophocles, Euripides, Cherillus, Aristarchus, Empedocles, Ion, Nomachus, and Cephedorus, who disputed for the prizes of tragic genius at the Olympic games before assembled Greece. The fertility of the genius of these writers appears immense, when we are told that Æschylus wrote seventy or eighty plays, Sophocles a hundred and twenty, Euripides ninety, Cherillus a hundred and fifty, and their rivals above mentioned nearly as many. The entire works of none of those authors have come down to posterity; but from those which have reached us of the three first, the great masters of the art, the general opinion has assigned the palm of sublimity to Æschylus, of pathos and sentiment to Sophocles, and of tragic art to Euripides.

Sophocles, the second of these great masters, was born at Calone, a village in the neighbourhood of Athens, about 497 years before Christ. His father, Sophilus, it appears, exercised the humble occupation of a blacksmith; but the education of his son was not neglected, as his early indications of genius were fostered, and his remarkable aptitude for the higher branches of literature were duly submitted to cultivation. At the same time, he devoted himself much to the accomplishments of music and dancing, in both of which arts he distinguished himself greatly, particularly at the time of the battle of Salamis, when, at the age of seventeen, he led a chorus of youths, in their musical performance, round a trophy erected in honour of that victory. At the usual age he chose the profession of arms, as being at that time more honourable, and probably more advantageous than any other, and had the honour to serve in the army under the celebrated commander Pericles. Here he soon became eminent for his valour and good conduct, so that he was appointed to a high military dignity, and is understood to have shared with his former leader, in several battles, the chief command of the Athenian armies. His services in the field were duly appreciated and rewarded by his fellow-citizens, who raised him to the high office of *Archon*, or chief magistrate of Athens, the duties of which he executed in a most efficient and creditable manner.

The first appearance of Sophocles as a dramatic writer left no room for doubting the splendour of his talents. The Athenians had captured the island of Scyros; and in order to celebrate that great event, a yearly contest for tragedy was instituted. Sophocles on this occasion, although he was but twenty-nine years of age, obtained the prize over many experienced competitors, in the number of whom was Æschylus, his former friend and preceptor. In domestic life he was not so fortunate as in his public career. His children, from an eager desire to get possession of his property, summoned him before the judges, for the purpose of proving him to be in dotage, and utterly incapable of managing his affairs. The old man appeared in court to repel this charge; and producing the tragedy of Œdipus Coloneus, which he had just finished, asked his judges if the author of such a work could be justly taxed with insanity. The judges, indignant at the imputation which had been preferred against him, confirmed him in the possession of his rights: his ungrateful children were covered with shame and confusion; and the people who were present conducted him home in triumph. He died at the age of ninety-one, 406 years before the Christian era, and his death is said to have been caused by excessive joy at the success of his last piece, which gained the prize at the Olympic games—as his master Æschylus is reported to have died of grief for being foiled by him in his first. Lucian, the Greek writer of Dialogues of the Dead, however, says that Sophocles died by being accidentally choked with a grape-stone.

Of one hundred and twenty tragedies which Sophocles is said to have written, only seven are now remaining, viz. Ajax, Electra, Philoctetes, Antigone, Truchiniæ, Œdipus Tyrannus, and Œdipus Coloneus.

In his dramas we trace a wonderful progress of the art, from its crude though sublime immaturity in the works of Æschylus. His plays have a noble, not a desolate, simplicity, like those of Æschylus; and he is far more happy in the conduct of his plots, which he rendered more interesting by being more artful, so as to waken attention, and keep it alive by tender, as well as terrible, emotions. It is remarked that he never acted himself in any of his plays, as Æschylus and Euripides were accustomed to do, his voice being too weak and low for the stage; though he attended always at the representation of his dramas, and on these occasions received invariably the applauses of the audience. He was crowned twenty times; and though, like his brother poets, he often suffered from unjust censure, yet he never could be prevailed on, as his rivals were, to quit his native country, for which he always showed an attachment of the most devoted kind.

The drama is indebted to this great man for the important improvement of a third speaker to the dialogue, into which his genius infused greater ease and elegance. He likewise added the decoration of painted scenery; and he enhanced the effect of the drama much, by paying a stricter attention to probability and natural incident. From the sweetness of his style, he received among the ancients the appellation of the *attic bee;* and the Athenians erected a sumptuous monument to his memory, on which was engraved a swarm of bees, in allusion to the above name given to him on account of his verses, which are indeed wonderfully soft and harmonious.

THE LAND OF SCOTT.

SECOND ARTICLE.

The small vale of Borthwick Water, which starts off from the strath of the Teviot a little above Hawick, contains a scene which cannot well be overlooked in an article bearing such a title as the present—namely, Harden Castle, the original though now deserted seat of the family of Scott of Harden, from which, through the Raeburn branch, Sir Walter Scott was descended. This, though neglected alike by its proprietor and by tourists, is one of the most remarkable pieces of scenery which we, who have travelled over nearly the whole of Scotland, have yet seen within its shores. Conceive, first, the lonely pastoral beauty of the vale of Borthwick; next, a minor vale receding from its northern side, full of old and emaciated, but still beautiful wood: penetrating this recess for a little way, the traveller sees, perched upon a lofty height in front, and beaming perhaps in the sun, a house which, though not picturesque in its outline, derives that quality in a high degree from its situation and accompaniments. This is Harden House or Castle; but, though apparently near it, the wayfarer has yet to walk a long way around the height before he can wind his way into its immediate presence. When arrived at the platform whereon the house stands, he finds it degraded into a farm-house; its court forming perhaps a temporary cattle-yard; every ornament disgraced; every memorial of former grandeur seen through a slough of plebeian utility and homeliness, or broken into ruin. A pavement of black and white diced marble is found in the vestibule, every square of which is bruised to pieces, and the whole strewed with the details of a dairy. The dining-room, a large apartment with a richly ornamented stucco roof, is now used as the farmer's kitchen. Other parts of the house, still bearing the arms and initials of Walter Scott, Earl of Tarras, great-grandfather of the present Mr Scott of Harden, and of his second wife, Helen Hepburn, are sunk in a scarcely less proportion. This nobleman was at first married to Mary Countess of Buccleuch, who died, however, without issue, leaving the succession open to her sister Anne, who became the wife of the unfortunate Duke of Monmouth, eldest natural son of Charles the Second. Through this family connection, the Earl of Tarras was induced to join in the conspiracy which usually bears the name of the Rye-house Plot, for which he was attainted, only saving his life by giving evidence against his more steadfast companion, Baillie of Jerviswood, the great-grandfather of another Scottish proprietor, who happens to be an immediate neighbour of Harden. It may be asked why Mr Scott does not inherit the title of his ancestor: the answer is, that it was only thought necessary to invest the husband of the Countess of Buccleuch with a title for his own life—which proves that the hereditary character of the peerage has not always been observed in our constitution. While all of this scene that springs from art is degraded and wretched, it is striking to see that its natural grandeur suffers no defalcation. The wide-sweeping hills stretch off grandly on all hands, and the celebrated *den*, from which the place has taken its name, still retains the features which have rendered it so remarkable a natural curiosity. This is a large abyss in the earth, as it may be called, immediately under the walls of the house, and altogether unpervaded by running water—the banks clothed with trees of all kinds, and one side opening to the vale, though the bottom is much beneath the level of the surrounding ground. Old Wat of Harden—such is the popular name of an aged marauder, celebrated in the Minstrelsy of the Scottish Border—used to keep the large herds which he had draughted out of the northern counties of England, in this strange hollow; and it seems to have been admirably adapted for the purpose. It was this border hero of whom the story is told somewhere by his illustrious descendant, that, coming once homeward with a goodly prey of cattle, and seeing a large hay-stack standing in a farm-yard by the way, he could not help saying, with some bitterness, "By my saul, an ye had four feet, ye should gang too!"

The house of Abbotsford, where Sir Walter Scott chiefly spent the last twenty years of his life, may be assumed as the centre of a great part of that region which we have styled *his*. This "romance in stone and lime," as some Frenchman termed it, is situated on the south bank of the Tweed, at that part of its course where the river bursts forth from the mountainous region of the forest, into the more open country of Roxburghshire; two or three miles above the abbey of Melrose, and six-and-thirty from Edinburgh. Though upon a small scale, the Gothic battlements and turrets have a good effect, and would have a still better, if the site of the house were not somewhat straitened by the bank rising above it, and by the too close neighbourhood of the public road. Descriptions of the house, with its armoury, its library, its curiosities, and other particular features, have been given in so many different publications, that even a work circulating fifty thousand copies can hardly hope to find a reader to whom a new one would not be a bore. We shall, therefore, spare it. The house, if it be properly preserved, will certainly be perused by future generations as only a different kind of emanation of the genius of this wonderful man—though, preserve it as you will, it will probably be, of all his works, the soonest to perish.

All around Abbotsford, and what gave it a great part of its value in his eyes, are the scenes commemorated in Border history, and tradition, and song. The property itself comprises the spot on which the last feudal battle was fought in this part of the country. The abbeys of Melrose and Dryburgh, the latter of which now contains the revered dust of the minstrel; the Eildon Hills, renowned in the annals of superstition; Selkirk, whose brave burghers won glory in the field where so much was lost by others, namely, at Flodden; Ettrick Forest, with its lone and storied dales; and Yarrow, whose stream and "dowie dens" are not to be surveyed without involuntary poetry; are all in the near neighbourhood of the spot. The love, the deep, heart-felt love, which Scott bore to the land which contains these places, was such as no stranger can appreciate. It was a passion absorbing many others which might have been expected to hold sway over him, and it survived to the last. We can, indeed, form no idea in connection with the decease of this great man, so very painful and so truly touching, as that of his parting with these fondly appreciated scenes. The sense that his eye must soon close for ever upon the hallowed region, which, from his earliest boyhood, he had surveyed with so many ardent feelings, was perhaps, to himself, a thought more deeply melancholy than almost any other which beset him during the rapidly closing evening of life.

There is a romantic point in the life of Sir Walter Scott, which has never yet been made known, even by a hint, to the public. This was his marriage—an event which was attended by circumstances entirely out of common life, and in themselves forming something like a novel. Owing to the distance of time, and the delicacy which was observed respecting many of these circumstances, there are now very few persons in life who possess any knowledge upon the subject: the following narrative, therefore, which is derived almost directly from one of the individuals principally concerned, will probably be read with interest.

THE MARRIAGE OF SIR WALTER SCOTT.

To begin at the beginning:—When the Marquis of Downshire, about fifty years ago, was about to proceed upon his travels, he begged some letters of introduction, amongst others, from the Reverend Mr Burd, Dean of Carlisle, who had been his early friend. This gentleman communicated to his lordship one letter, recommending him to the favourable notice of almost his only continental acquaintance, Monsieur Carpentier of Paris, an individual who held the lucrative office of provider of post-horses to the royal family of France. The unhappy result of this new association was the elopement of Madame Carpentier, a very beautiful woman, in company with his lordship. The only step taken by the husband in this case was to transmit his two children, a boy and girl, to his frail wife, with a desire, signified or implied, that she would undertake the duty of bringing them up. The children, accordingly, lived for some years with their mother, under the general protection of Lord Downshire, till at length the lady died, and the young nobleman found himself burdened with a responsibility which he probably had not calculated upon at the time of his quitting Paris. However, he placed the girl in a French convent for her education, and soon after, by an exertion of patronage, had the boy sent out on a lucrative appointment to India, his name having been previously changed, on his naturalization as a British subject, to Carpenter. It was a stipulation before the young man received his appointment, that two hundred pounds of his annual salary should fall regularly every year to his sister, of whose support Lord Downshire was thus cleared, though he continued to consider himself as her guardian. Miss Carpenter in time returned to London, and was placed under the charge of a governess named Miss Nicholson, who, however, could not prevent her from forming an attachment to a youthful admirer, whose addresses were not agreeable to the marquis. His lordship, having learned that a change of scene was necessary, wrote hastily to Mr Burd, requesting him to seek for a cottage in his own neighbourhood among the Cumberland lakes, fit for the reception of two young ladies who could spend two hundred a-year. Mr Burd, having made the desired inquiries, wrote to inform his lordship that there was such a place near his own house, but that it would require a certain time to put it into repair. He heard no more of the matter, till, a few days after, as he and Mrs Burd were on the point of setting out for Gilsland Wells, on account of the delicate health of the latter individual, they were surprised by the arrival of two young ladies at their door in a post-chaise, being the persons alluded to by the marquis. His lordship had found it convenient to send them off to the care of Mr Burd, even at the hazard of the house not being ready for their reception. This was at the end of the month of August, or beginning of September, 1797. The dilemma occasioned by the unexpected arrival of the young ladies was of a very distressing kind, and Mrs Burd was afraid that it would, for one thing, put a stop to her intended expedition to Gilsland. Her husband, however, finally determined that their journey thither should still hold good, and that, to place his guests above inconvenience, they should join the party proceeding to the Spa.

Having duly arrived at Gilsland, which is situated near the borders of Scotland, they took up their residence at the inn, where, according to the custom of such places, they were placed, as the latest guests, at the bottom of the table. It chanced that a young Scotch gentleman had arrived the same afternoon, though only as a passing traveller, and he, being also placed at the bottom of the table, came into close contact with the party of Mr Burd. Enough of conversation took place during dinner to let the latter individuals understand that the gentleman was a Scotchman, and this was in itself the cause of the acquaintance being protracted. Mrs Burd was intimate with a Scotch military gentleman, a Major Riddell, whose regiment was then in Scotland; and as there had been a collision between the military and the people at Tranent, on account of the militia act,* she was anxious to know if her friend had been among those present, or if he had received any hurt. After dinner, therefore, as they were rising from table, Mrs Burd requested her husband to ask the Scotch gentleman if he knew any thing of the late riots, and particularly if a Major Riddell had been concerned in suppressing them. On these questions being put, it was found that the stranger knew Major Riddell intimately, and he was able to assure them, in very courteous terms, that his friend was quite well. From a desire to prolong the conversation on this point, the Burds invited their informant to drink tea with them in their own room, to which he very readily consented, notwithstanding that he had previously ordered his horse to be brought to the door in order to proceed upon his journey. At tea, their common acquaintance with Major Riddell furnished much pleasant conversation, and the parties became so agreeable to each other, that, in a subsequent walk to the Wells, the stranger still accompanied Mr Burd's party. He had now ordered his horse back to the stable, and talked no more of continuing his journey. It may be easily imagined that a desire of discussing the major was not *now* the sole bond of union between the parties. Mr Scott—for so he gave his name—had been impressed, during the earlier part of the evening, with the elegant and fascinating appearance of Miss Carpenter, and it was on her account that he was lingering at Gilsland. Of this young lady, it will be observed, he could have previously known nothing: she was hardly known even to the respectable persons under whose protection she appeared to be living. She was simply a lovely woman, and a young poet was struck with her charms.

Next day Mr Scott was still found at the Wells—and the next—and the next—in short, every day for a fortnight. He was as much in the company of Mr Burd and his family as the equivocal foundation of their acquaintance would allow; and by affecting an intention of speedily visiting the lakes, he even contrived to obtain an invitation to the dean's country house in that part of England. In the course of this fortnight, the impression made upon his heart by the young Frenchwoman was gradually deepened; and it is not improbable, notwithstanding the girlish love affair in which Miss Carpenter had been recently en-

* The Tranent riots took place August 28, 1797.

gaged, that the effect was already in some degree reciprocal. He only tore himself away, in consequence of a call to attend certain imperative matters of business at Edinburgh.

It was not long ere he made his appearance at Mr Burd's house, where, though the dean had only contemplated a passing visit, as from a tourist, he contrived to enjoy another fortnight of Miss Carpenter's society. In order to give a plausible appearance to his intercourse with the young lady, he was perpetually talking to her in French, for the ostensible purpose of perfecting his pronunciation of that language under the instructions of one to whom it was a vernacular. Though delighted with the lively conversation of the young Scotchman, Mr and Mrs Burd could not now help feeling uneasy about his proceedings, being apprehensive as to the construction which Lord Downshire would put upon them, as well as upon their own conduct in admitting a person of whom they knew so little to the acquaintance of his ward. Miss Nicholson's sentiments were, if possible, of a still more painful kind, as, indeed, her responsibility was more onerous and delicate. In this dilemma, it was resolved by Mrs Burd to write to a friend in Edinburgh, in order to learn something of the character and status of their guest. The answer returned was to the effect, that Mr Scott was a respectable young man, and rising at the bar. It chanced at the same time that one of Mr Scott's female friends, who did not, however, entertain this respectful notion of him, hearing of some love adventure in which he had been entangled at Gilsland, wrote to this very Mrs Burd, with whom she was acquainted, inquiring if she had heard of such a thing, and "what kind of a young lady was it, who was going to take Watty Scott?" The poet soon after found means to conciliate Lord Downshire to his views in reference to Miss Carpenter, and the marriage took place at Carlisle within four months of the first acquaintance of the parties.

The match, made up under such extraordinary circumstances, was a happy one; a kind and gentle nature resided in the bosoms of both parties, and they lived accordingly in the utmost peace and amity. The bounteous but unostentatious beneficence of Lady Scott will long be remembered in the rural circle where she presided; and though her foreign education gave a tinge of oddity to her manners, she formed an excellent mistress to the household of her illustrious husband, and an equally excellent mother to his children. One of the last acts of Sir Walter Scott, before the illness which carried her to the tomb, was to discharge an attached and valued servant who had forgot himself one day so far as to speak disrespectfully to his mistress. He lamented the necessity of parting with such a servant, and one who had been so long with him; but he could not overlook an insult to one whom he held so dear.

SKETCHES OF NORWAY.

To many, the name of Norway will convey only ideas of a bleak wintry region, almost deprived of every comfort, and fit only for the residence of a half civilized unrefined people. But ideas of this description, however natural they may be, from the general ignorance which prevails regarding the country, will be greatly modified or dispelled on perusing the Narrative of a Journey through Norway and part of Sweden, performed by Mr H. D. Inglis, a young Scotsman, who, under the fictitious designation of Derwent Conway, has presented the world with a very amusing work, forming one of the volumes of Constable's Miscellany. By way of extending still more widely a knowledge of this interesting portion of the north of Europe, we take the liberty of condensing the following details from the publication to which we refer:—

Norway is a mountainous, and mostly a pastoral, country,* with extensive forests of huge timber, once a staple article of export to this country, and well known for its excellent properties. Its people are a Scandinavian or Gothic race, characterized for those simple virtues common to nations holding little intercourse with the more polished kingdoms in their neighbourhood. Still retaining many of the ancient superstitious usages of their pagan ancestors, and being warmly attached to their country, they possess a variety of customs and peculiarities highly interesting to those who are unacquainted with them. Most people who have heard any thing of the state of manners of the northern nations, assign to them the practice of drinking deeply; and this, our traveller admits, is still the case among the Norwegians. All ranks, he tells us, drink freely, and the lower orders to excess. But it would appear that this originates, in a great measure, first, from the extraordinary cheapness of liquors, and, second, from the devoted patriotism of all classes of the people. In the enthusiastic love of country, every nation must yield to Norway. A Norwegian loves, reveres all that belongs to and distinguishes his native land—his mountains, his rocks, his forests, he would not exchange for the richest plains of the south. To a Norwegian, the words *Gamlé Norgé*, which signify *Old Norway*, have a spell in them immediate and powerful. On festive occasions they cannot be resisted. *Gamlé Norgé* is heard in an instant repeated by every voice; the glasses are filled, raised, and drained; not a drop is left; and then bursts forth the simultaneous chorus, "*For Norgé!*" the national song of Norway. In Scotland, "the Land of Cakes" is nearly an equivalent; but though Scotsmen drain their glasses to the patriotic toast, they do not, like the warm-hearted Norwegians, start to their feet, nor give that burst of enthusiasm which no circumstances have power to restrain.

The Norwegians possess in a high degree the primitive virtue of hospitality to strangers, and is described by our traveller as without a parallel. It is, in fact, looked upon as a national duty; and I believe, says he, that he who should omit to practise it, would be regarded by others in the same light as that in which a man is looked upon in England who commits an offence against the established proprieties of life. The hospitality of even the Highlands of Scotland—and to that we, at least, can bear ample testimony—he adds, cannot be compared with that of Norway, not only in the country, but in towns and cities. The arrival of a stranger in a town makes universal holiday; and the subject of deliberation is not "when shall we invite Mr ——, for of course we must invite him," but "what contrivances can we fall upon to make this stranger recollect his stay in our town as the happiest time he ever passed." The cultivated tone of society in Christiana, the capital of Norway, is at the same time described as certainly quite equal to that which is met with in the cities of the south. It is here as invariable a rule not to appear at a party in which there are ladies, unless in full dress, as it is in the first circles in England. The Norwegians, however, have a custom at entertainments, which at first sight seems scarcely accordant with a refined state of society: it is that of every guest, as he rises from the table, saying, as he bows to the lady of the mansion, *tacke for maden*—thanks for your entertainment. And if any circumstance should have prevented the guest from making this acknowledgment, it is not forgotten by him for a week or weeks afterwards—the first time, in short, he may happen to see his entertainer—and is received as a thing expected.

The condition of the Norwegian ladies is described as being by no means enviable. Eating and drinking being the great business of life, the females in all ranks are reduced to the character of cooks and scullions. The greater the establishment the greater the slavery. The servants of the household are merely the assistants of the mistress. It is she who cooks and dresses the immense loads of victuals; it is she (or the daughters) who carries the dishes to the table; she who changes the plates, wipes the knives, waits upon the guests, and performs other duties elsewhere committed to servants. All this seems odd, but the Norwegian ladies consider their occupations as agreeable, and not inconsistent with the ordinary and polite amusements of society.

The Norwegians, as appears from the author before us, are not what we would consider as a people attached to the observances of Christianity; partly because their country, until very recent times, was under the delusions and idolatries of a hideous mythology, and partly from the scarcity both of an intelligent clergy and of bibles. The parishes are so large, and the country so rough and difficult, that the mass of the inhabitants have few opportunities of public edification; while in some places the price of a single bible is as much as a pound sterling, which, from the scarcity of money in Norway, is perhaps equivalent to ten pounds in this country. Yet there is no want of good morals among the people; and their honesty and other virtues would shame those who live in more highly favoured lands.

The following account of the climate and seasons in Norway is among the happiest pieces in the volume:—"There is one respect in which Norway possesses an advantage to the traveller over every other country in Europe: it is this, the variety of season in Norway; and, consequently, the various aspects under which nature presents herself in these seasons may all be witnessed by the traveller in the course of four months, June, July, August, and September. The spring in Norway does not extend beyond one month, summer occupies two, and autumn about six weeks. The mild weather, from the middle of April till towards the middle of May, serves only to melt the snows. The change from winter to spring is like the work of enchantment; for the disappearance of snow is not, as it is in England, followed by weeks of gradual growth, but rather seems to be but the lifting up of a veil, beneath which earth's green and flowery carpet has been concealed. From spring to summer, and from summer to autumn, the change, though not so apparently miraculous, is yet infinitely surprising. The fruit trees bud, blossom, and bend beneath the burden of fruit, all within three months; and the corn springs up, and waves a golden harvest, in considerably less time. From autumn to winter, the transition is as rapid as from winter to spring. September is generally calm, and its frosty nights change the hue of the trees, and wither the stalks. One day, the woods stand in full foliage, changed in nothing from their summer aspect but in their hues; the next, a rushing wind comes from the north, strips them of their leafy glories, and perhaps even changes their summer vesture to the raiment of winter. In England, we are apt to form very exaggerated notions of the degree of cold which is experienced in the northern countries. When there is little or no wind, intense cold is scarcely felt to be an inconvenience, provided one be suitably clothed; and during by far the greater part of winter, the weather is calm, so that even when the thermometer stands below *zero*, one is able to move about comfortably, and even to enjoy the fine weather which so generally attends intense frost. I have suffered ten times the degree of cold travelling on a stage-coach in England, in the face of a north-east wind, than ever I suffered in a sledge in Norway, when the thermometer has been forty-seven degrees below the freezing point. Sometimes, indeed, the frost is accompanied by wind, and then it is scarcely possible to stir out of doors; but in the southern parts of Norway the combination of a very intense frost and a scarifying wind, is scarcely ever felt. It is true also, that, in the depth of winter, the shortness of the days does not allow many hours of clear bright sunshine; but then the houses are not built like summer houses, as many are in England; and stoves in the towns, and great wood fires in the country, and sometimes both, effectually oppose the power of the elements. There is not, in fact, a more comfortable abode than that of a substantial landowner or a thriving merchant on a winter's day in Norway. There are no cross airs blowing through the house, as in many of the unsubstantial dwellings in England; nor does one know what it is to have one part of the body scorched with the fire, while the other is suffering under the influence of cold; and I scarcely know any thing which can be compared to the luxury of sleeping between two eider-down beds." The purity of the atmosphere in Norway, and the exercise taken by the people, keep at a distance many of the complaints common to our population. Common coughs and colds, as well as rheumatic complaints, are extremely rare, which we esteem as a blessed peculiarity of any country; for *colds* are the commencement of a vast proportion of the diseases and deaths which occur in this island. It is further related, that the air has the effect of giving a keen appetite; and though the consumption of victuals is carried to a greater excess than in England, indigestion with its train of evils is unknown. The cure for diseases in Norway is simpler for fever, and every species of indisposition for which there is no definite name, the universal remedy is brandy, with a quantity of pepper mixed in it. If a man recover from a fever, it is the brandy and pepper that has accomplished the cure; if he die, his friends console themselves with the idea, that, if he had drunk it faster, or in greater quantities, he would still have lived. Hard drinking, it seems, does no injury to the hardy Scandinavian, who lives to a hale old age, till the last quaffing cups of his favourite brandy, and conscientiously believing that in every cup there is a drop of the true elixir of life.

Such is the character of the Norwegian climate, which, it is perceived, is much more pleasant and productive of longevity than is generally supposed. It is also remarkable that here garden fruits and vegetables come to high perfection, especially in sheltered situations. The most favourite, and one of the most useful fruits in Norway, is the cherry, the crop of which is scarcely ever known to fail: when ripe, the cherries are preserved in great quantities, for condiments and culinary purposes. Agriculture is still conducted in a slovenly manner; consequently the crops of corn are generally poor, and the quantity produced is very much diminished by the landowners devoting a considerable proportion to the distillation of what they term corn-brandy—a liquor in extensive requisition. Near Christiana, the district is fertile, and much better cultivated, a large portion of the land being under tillage, indicating abundance and industry. Many of the vallies in this quarter are described as presenting as rich harvest prospects as are to be seen in Wilts or Somersetshire.

Nothing astonishes a stranger in Norway so much as the extreme cheapness of various articles, especially edibles. In the neat and beautifully situated city of Christiana, which stands on an arm of the sea, studded with pretty woody islands, in the most pleasant part of the country, the expense of housekeeping bears no comparison with what is experienced in any part of Great Britain. For instance, we are informed that mutton is sold at from 3d. to 4d. per lb.; beef, 4d. to 5d.; butter, 8d.; a capon, 8d.; a hare, 4d.; a pheasant, 1s.; a wild duck, 6d.; eggs, 4d. a-dozen; salmon no more than a penny or a penny farthing per lb., and the salmon is delicious in flavour at this low price; sea fish is still lower; apples of the best quality 8d. per 100. As for the best French brandy, it can be had for 1s. per bottle, and common brandy at half that price. Game is abundant, and there being no game laws of any kind, it is always a cheap article of food; indeed, every peasant may enjoy it if he pleases. Vegetables, while in season, are also very low in price. We have heard not a little of the various places of cheap living in different quarters of the United Kingdom and on the Continent, but no place can come into comparison with the capital of Norway in this respect. This is certainly a place suited above all others for the residence of retired annuitants, whose incomes are limited, and who are not bound to reside in any

* It is bounded on the west and north by the Northern Ocean, and extends from 57 to 71 degrees north latitude. Politically, it is now joined to Sweden, of which Bernadotte is king.

particular part of the world. Here an excellent and commodious house, fit for the residence of a genteel English family, may be had at a rent of L.20 per annum, without almost any vestige of additional taxation. We presume that for L.100 a-year, a family might live as well in Christiana, or its charming environs, as they do in an English town at more than double that sum. In the remote parts of Norway, especially where fish abounds, the general charges are much lower. The outlays in travelling over this romantic region are not less reasonable. The charge for a couple of horses is about threepence an English mile, and a third in addition to the driver; so that we may post with two horses a hundred miles for 33s., instead of upwards of L.10, which it would cost in England. To those fond of wandering with a dog and gun, or who take delight in the sports of the field, Norway, of course, offers additional advantage.

The stranger in Norway will not find those comforts in travelling which he experiences in this country, but neither will he see that mercenary spirit exercised, which every where predominates in England. For less than what he would here have to give the servants of an inn, he will pay the whole expenses of the road, and, if necessity requires, his application for shelter in the cottage of the peasant will not be answered gruffly, or refused. The Norwegians are an ingenious and worthy people, though too much addicted to the ancient and unprofitable practices of their forefathers. "A Norwegian (says our author), in his own cottage, with his few goats, his cow, his rye-field, his potato patch, and, above all, his fir log, is an industrious and ingenious member of society. One day you will find him building or repairing his boat; another day, constructing a little cart, or a sledge; a third day, he will be employed making a table, or carving a bowl, or thatching the roof of his cottage with turf or bark, or making a pair of boots, or mending a jacket, or embroidering a button-hole; or, if not in his cottage, or at the door, he is employed in the culture of his bit of land, or feeding his live stock, or catching fish for dinner. The Norwegian peasant possesses little of that knowledge which in England would be esteemed proof of the 'march of intellect.' He knows no theory that he cannot practise; but he can practise every thing that is requisite for his comfort. He can build his house, and construct hedges, and make his implements of husbandry, and yet he knows no principle of architecture, no problem in geometry, nor the name of any one of the five mechanical powers. He can distil his corn-brandy, and birch-wine, and make dye and use it; yet he knows nothing of chemistry." Such are the peasantry in this interesting northern land.

We conclude these sketches with a recommendation to our readers to procure and read the volume from whence they are drawn, being convinced that its perusal will afford them much both of entertainment and instruction.

BIOGRAPHIC SKETCHES.

DAVID RITTENHOUSE.

THE object of the present sketch was by birth an American, and, like his contemporary and countryman Benjamin Franklin, whose philosophical pursuits were somewhat akin to his own, he deserves the attention of our youthful readers, from the circumstance of his having risen by application, and the strength of his genius, from an obscure station in society, to take an honourable place among the most distinguished men of his day.

David Rittenhouse, whose name has been celebrated in the annals of astronomical science, was born near Germantown, Pennsylvania, on the 8th of April 1732. His family, which was of Dutch extraction, were the first who engaged in the manufacture of paper in this country. The father of David Rittenhouse abandoned the occupation of a paper-maker, when about twenty-nine years of age, and commenced the business of a farmer, on a piece of land which he had purchased in the township of Norriton, about twenty miles from the city of Philadelphia. It seems that he very early designed his son for this useful and respectable employment. Accordingly, as soon as the boy arrived at a sufficient age to assist in conducting the affairs of the farm, he was occupied as a husbandman. This kind of occupation appears to have commenced at an early period of his life. About the fourteenth year of his age, he was employed in ploughing in his father's fields. His brother Benjamin relates, that while David was thus engaged at the plough, he (the informant), then a young boy, was frequently sent to call him to his meals; at which times he repeatedly observed, that not only the fences at the head of many of the furrows, but even his ploughs and its handles, were covered over with chalked numerical figures. Astronomy was a favourite pursuit. He also applied himself industriously to the study of optics, the mechanical powers, &c., without the advantages of the least instruction. About the seventeenth year of his age, he made a wooden clock, of very ingenious workmanship; and soon after, he constructed one of the same materials that compose the common four-and-twenty hour clock, and upon the same principles. He had, much earlier in life exhibited proofs of his mechanical genius, by making, when only seven or eight years old, a complete water-mill in miniature.

With many valuable traits of character, old Mr Rittenhouse had no claims to what is termed genius. Hence he did not properly appreciate the early specimens of talent which appeared in his son David. He was for some time opposed to the young man's earnest desire to renounce agricultural employments, for the purpose of devoting himself altogether to philosophical pursuits, in connection with some such mechanical profession as might best comport with useful objects of natural philosophy, and be most likely, at the same time, to afford him the means of a comfortable subsistence. At length, however, the father yielded his own inclinations, in order to gratify what was manifestly the irresistible impulse of his son's genius. He supplied him with money to purchase, in Philadelphia, such tools as were more immediately necessary for commencing the clock-making business, which the son then adopted as his profession. About the same time, young Mr Rittenhouse erected, on the side of a public road and on his father's land, in the township of Norriton, a small but commodious workshop; and after having made many implements of the trade with his own hands, to supply the deficiency in his purchased stock, he set out in good earnest, as a clock and mathematical instrument maker. From the age of eighteen or nineteen to twenty-five, Mr Rittenhouse applied himself unremittingly, both to his trade and his studies. Employed throughout the day in his attention to the former, he devoted much of his nights to the latter. Indeed, he deprived himself of the necessary hours of rest; for it was his almost invariable practice to sit up at his books until midnight, sometimes much later.

When Mr Rittenhouse's father established his residence at Norriton, and during the minority of the son, there were no schools in the vicinity at which any thing more was taught than reading and writing in the English language, and the simplest rules of arithmetic. Young Rittenhouse's school education was therefore necessarily bounded by very narrow limits. He was in truth *taught* nothing beyond those very circumscribed studies which have been named, prior to his nineteenth year. The zeal with which he pursued his studies will be seen from the following extract of a letter, written in September 1756, being then little more than twenty-four years of age. "I have not health for a soldier" (the country was then engaged in war), "and as I have no expectation of serving my country in that way, I am spending my time in the old trifling manner, and am so taken with optics, that I do not know whether, if the enemy should invade this part of the country, as Archimedes was slain while making geometrical figures on the sand, so I should die making a telescope."

It was during the residence of Rittenhouse with his father at Norriton, that he made himself master of Sir Isaac Newton's Principia, which he read in the English translation of Mr Motte. It was here, likewise, that he became acquainted with the science of fluxions, of which sublime invention he believed himself for a while to be the author; nor did he know for some years afterwards that a contest had been carried on between Sir Isaac Newton and Leibnitz, for the honour of that great and useful discovery. Mr Rittenhouse's early zeal of his practical researches into astronomy, prompted him to desire the greatest possible accuracy in the construction of time-pieces adapted to astronomical purposes; and uniting, as he did, operative skill with a thorough knowledge of the principles upon which their construction depends, he was enabled, by his own mechanical ingenuity, to gain a near approach to the perfection to which the pendulum-chronometer may be brought.

The great accuracy and exquisite workmanship displayed in every thing belonging to the profession which Mr Rittenhouse pursued, that came through his hands, soon became extensively known in that portion of the United States where he lived. This knowledge of his mechanical abilities, assisted by the reputation which he had already acquired as a mathematician and astronomer, in a short time procured him the friendship and patronage of some eminent scientific men. In mechanics he was entirely *self-taught*. He never received the least instruction from any person, in any mechanic art whatever. If he were to be considered merely as an excellent artist, in an occupation intimately connected with the science of mechanics, *untutored* as he was in any art or science, he would deservedly be deemed an extraordinary man.

In the year 1767, among other things he contrived and made a very ingenious thermometer, constructed on the principle of the expansion and contraction of metals by heat and cold respectively.

About this time also he made a very ingenious orrery. Though no description in words can give an adequate idea, yet we subjoin a part of the philosopher's own account of it. "This machine is intended to have three faces standing perpendicular to the horizon; that in the front to be four feet square, made of sheet brass, curiously polished, silvered, and painted, in proper places, and otherwise properly ornamented. From the centre arises an axis, to support a gilded brass ball, intended to represent the sun. Round this ball move others, made of brass or ivory, to represent the planets. They are to move in elliptical orbits, having the central ball in one focus; and their motions to be sometimes swifter, and sometimes slower, as nearly according to the true law of an equable description of areas as possible, without too great a complication of wheel-work. The orbit of each planet is likewise to be properly inclined to those of the others; and their aphelia and nodes justly placed; and their velocities so accurately adjusted as not to differ sensibly from the tables of astronomy in some thousands of years.

"For the greater beauty of the instrument, the balls representing the planets are to be of considerable bigness, but so contrived that they may be taken off at pleasure, and others, much smaller, and fitter for some purposes, put in their places.

"When the machine is put in motion, by the turning of a winch, there are three indexes which point out the hour of the day, the day of the month, and the year answering to that situation of the heavenly bodies which is there represented; and so continually, for a period of five thousand years, either forwards or backwards."

Another most important service which he rendered for the world was the observation of the *transit of Venus* over the sun's disc, which took place on the 3d of June 1769. There had been but one of these transits of Venus over the sun during the course of about one hundred and thirty years preceding that of 1769; and for upwards of seven centuries, antecedently to the commencement of that period, the same planet had passed over the sun's disc no more than thirteen times. The next transit of Venus will take place on the 8th of December 1874.

The great use of the observation of the transit of Venus is to determine the sun's parallax, or apparent change of its place. Only two of these phenomena had been *observed* since the creation of the world, and the first had been seen by only two persons—Jeremiah Horrox and William Crabtree, two Englishmen. As the time approached when this extraordinary phenomenon was to manifest itself, the public expectation and anxiety were greatly excited. The American Philosophical Society appointed thirteen gentlemen, to be distributed into three committees, for the purpose of making observations. The Rev. Dr Ewing had the principal direction of the observatory in the city of Philadelphia; Mr Owen Biddle had the charge of superintending the observations at Cape Henlopen, and Mr Rittenhouse those at Norriton, near his own residence, on an elevated piece of ground, commanding a good range of horizontal view. It was completely furnished with the necessary instruments, owing very much to the liberality of some scientific gentlemen in England.

"We are naturally led," says Dr Rush, in his eulogium, "to take a view of our philosopher, with his associates, in their preparations to observe a phenomenon which had never been seen but twice before by any inhabitant of our earth, which would never be seen again by any person then living, and on which depended very important astronomical consequences. The night before the long-expected day was probably passed in a degree of solicitude which precluded sleep. How great must have been their joy when they beheld the morning sun, and the 'whole horizon without a cloud!' for such is the description of the day given by Mr Rittenhouse, in his report to Dr Smith. In pensive silence and trembling anxiety, they waited for the predicted moment of observation; it came, and brought with it all that had been wished for, and expected, by those who saw it. In our philosopher, in the instant of one of the contacts of the planet with the sun, there was an emotion of delight so exquisite and powerful as to induce fainting; such was the extent of that pleasure which attends the discovery or first perception of truth."

The observations of Mr Rittenhouse were received with great favour by the whole philosophical world. Mr Ludlam, one of the vice-presidents of the Philosophical Society of London, and an eminent astronomer, thus writes:—"No astronomers could better deserve all possible encouragement, whether we consider their care and diligence in making their observations, their fidelity in relating what was done, or the clearness and accuracy of their reasoning on this curious and difficult subject. The more I read the transactions of your society (the American Philosophical), the more I honour and esteem the members of it. *There is not another society in the world that can boast of a member such as Mr Rittenhouse;* theorist enough to encounter the problems of determining, from a few observations, the orbit of a comet, and also mechanic enough to make with his own hands an equal-altitude instrument, a transit-telescope, and a time-piece."

Rittenhouse now pursued an honourable and distinguished carreer as an astronomer. As a testimony of the high sense which the legislature of Pennsylvania entertained of his mathematical genius and mechanical abilities, it presented him the sum of three hundred pounds. In 1791, on the death of Dr Franklin, he was elected president of the American Philosophical Society, and in 1795 he was elected a member of the Royal Society of London. But he did not live long to enjoy his distinguished honours. He died in June 1796, soon after his entrance upon his sixty-fifth year. He was a very modest and unassuming man, and in this strikingly resembled Sir Isaac Newton, for whose character and works he had the highest veneration. His usefulness, though great, was considerably circumscribed by his want of an early education. In consequence of this, he felt an unbecoming diffidence in his own powers, and failed to commit his discoveries and thoughts to writing, which, in a

published form, would doubtless have eminently increased his usefulness, and the honour of the country which gave him birth.*

NATURAL HISTORY.

THE DOG.

The services of this truly valuable animal have been so eminently useful to the domestic interests of man in all ages of the world, that to give a history of the dog would be little less than to trace mankind back to their original state of simplicity and freedom, to mark the progress of civilization through the various changes of the world, and to follow attentively the gradual advancement of that order which placed man at the head of the animal kingdom, and gave him a manifest superiority over every part of the brute creation.

Of all animals, the dog seems most susceptible of change, and most easily modified by difference of climate, food, and education. Not only the figure of his body, but his faculties, habits, and dispositions, vary in a surprising manner. Nothing appears constant in them but their internal conformation, which is alike in all; in every other respect they are dissimilar: they vary in size, in figure, in length of the nose and shape of the head, in the length and direction of the ears and tail, in the colour, quality, and quantity of the hair, and in other particulars. To enumerate the different kinds, or to mark the discriminations by which each is distinguished, would be a task as fruitless as it would be nearly impossible. To account for this wonderful variety, or investigate the character of the principal stock from which they have sprung, would be attended with no less difficulty. Of this we are certain, that in every age dogs have been found possessed of qualities most admirably adapted for the various purposes to which they have been from time to time applied. We know, in the history of the cow and sheep, that those animals which have been long under the dominion of man never preserve the stamp of nature in its original purity. In wild animals, which enjoy their natural freedom from restraint, and have the independent choice of food and climate, this impression is still faithfully preserved; but those which man has subdued, transported from climate to climate, and their food, habits, and manner of living changed, must necessarily have suffered the greatest alterations of form; and as the dog, of all other domestic animals, is most accustomed to this influence, is endowed with dispositions the most docile and obedient, is susceptible of every impression, and submissive to every restraint, we need not wonder that he should be subject to the greatest variety.

Naturalists suppose that all the different varieties of dogs had their origin in the colley, or shepherd's dog.

The acute intelligence and keenness of observation in the dog are well illustrated by the following moving anecdote from the pen of Dibdin:—"The grandfather of as amiable a man as ever existed, and one of my kindest and most valued friends, had a dog of a most endearing disposition. This gentleman had an occupation which obliged him to go a journey periodically, I believe once a month. His stay was short, and his departure and return were regular, and without variation. The dog always grew uneasy when he first lost his master, and moped in a corner, but recovered himself gradually as the time for his return approached, which he knew to an hour, nay, to a minute, as I shall prove. When he was convinced that his master was on the road, at no great distance from home, he flew all over the house, and if the street door happened to be shut, he would suffer no servant to have any rest till it was opened. The moment he obtained his freedom, away he ran, and, to a certainty, met his benefactor about two miles from town. He played and frolicked about him till he had obtained one of his gloves, with which he ran, or rather flew, home, entered the house, laid it down in the middle of the room, and danced round it. When he had sufficiently amused himself in this manner, he again darted out of the house, returned to meet his master, and ran before him, or gambolled by his side, till he arrived with him at home. I know not how frequently this was repeated, but it lasted, however, till the old gentleman grew infirm, and incapable of continuing his journeys. The dog by this time was also grown old, and became at length quite blind; but this misfortune did not hinder him from fondling his master, whom he knew from other persons, and for whom his affections and solicitude rather increased than diminished. The old gentleman after a short illness died; the dog knew the circumstance, watched the corpse, blind as he was, and did his utmost to prevent the undertaker from screwing up the body in the coffin, and most outrageously opposed it being taken out of the house. Being past hope, he grew disconsolate, lost his flesh, and was evidently verging towards his end. One day he heard a stranger come into the house, and rose to meet him. His master, when old and infirm, had worn ribbed stockings for warmth. This gentleman had stockings on of the same kind. The dog, from this resemblance, thought it was his master, and began to demonstrate the most extravagant pleasure; but upon farther examination, finding his mistake, he retired into a corner, where in a short time he expired."*

* Abridged from Biography of Self-taught Men. Boston, 1832.

THE WOLF.

The specific characters of the wolf and dog are so nearly the same, that a particular description of its form is unnecessary. One of the leading distinctions is, that the eyes of the wolf are placed more obliquely than those of the dog, which gives it a character of savage fierceness; its tail is long and bushy, which it never carries erect, but always in a hanging position, rather bending inwards between its hind legs.

Wolves differ considerably in colour and size, according to the species and variety. They inhabit every quarter of the globe, and have great strength. Their disposition is fierce and cruel; they associate in large packs, and frequently spread desolation in the districts they invade.

Notwithstanding this savage and malignant disposition, the wolf is a cowardly and sneaking animal: he is jealous that every object which he meets with is a snare to entrap him. In Lapland, if he comes upon a rein-deer tied to a post to be milked, he will not venture to approach it, lest the animal should be placed there as a decoy for him; but no sooner is the deer set at liberty than he commences a pursuit, and seldom fails to destroy him. It not unfrequently happens, however, that the deer gets irritated, and stands at bay, in which event the wolf instantly becomes intimidated, and desists from the attack. Hunger alone can stimulate him to determined courage. In that case he will then brave every danger, and attack animals which are under the immediate protection of man; and even man himself frequently falls a victim to the united attacks of wolves. It is said, that, after having tasted human blood, he prefers it to all other. This has given rise to many superstitious stories regarding him.

In all ages of the world, the wolf has been regarded as the direct or indirect enemy of man, and many schemes have been invented to get rid of this ferocious animal. Pitfalls, traps, and other engines of destruction, have been employed for his capture, and poison has also been successfully used. He has long since been expelled from Britain.

In early times, wolves were very plentiful in England, and committed great havoc amongst the flocks. King Edgar, to encourage their destruction, in many cases commuted the punishment of criminals into a requisition of a certain number of wolves' tongues from each, according to the degree of the offence. A Welsh prince who paid tribute to him was oppressively ordained, instead of money, to produce annually three hundred heads of wolves.

According to Hollinshed, the flocks in Scotland suffered much from the ravages of wolves in 1577; and it was not till about a century afterwards that they were wholly extirpated. The last wolf known in Scotland was destroyed at Lochaber, by Sir Evan Cameron of Lochiel, who died in 1719. They infested Ireland many centuries after their extinction in Britain; the last presentment for killing wolves was made in the county of Cork, about the year 1710.

The female goes with young about three months and a half, and brings forth five or six young ones.

Sir Ashton Lever had a wolf whose savage propensities were entirely subdued, and there are many other instances on record. Buffon procured several while young, and brought them up, and by using gentle means they were soon domesticated. During the first year they were generally very docile, and fawned upon him like a dog; but at eighteen months or two years their savage nature began to betray itself, at which period it became necessary to chain them, to prevent their escape. Before this they were allowed to range at large, and he always kept them in a yard associated with poultry, which they never touched: however, one of them, when eighteen months old, for his first essay, attacked and killed the whole of his poultry in a single night, which seemed to arise from pure mischief, as he did not eat one of them.

A singular circumstance, exhibiting in a remarkable degree the reflecting faculties of a wolf, is related as having taken place at Signy-le-Petit, a small town on the borders of Champagne. A farmer one day looking through the hedge of his garden, noticed a wolf walking round about his mule, but was unable to get at him, on account of the mule's constantly kicking with his hind legs. As the farmer perceived that his beast was so well able to defend itself, he considered it unnecessary to render him any assistance. After the attack and defence had lasted fully a quarter of an hour, the mule ran off to a neighbouring ditch, where he several times plunged into the water. The farmer imagined he did this to refresh himself after the fatigue he had sustained, and had no doubt that his mule had gained a complete victory. But in a few minutes the wolf returned to the charge, and approaching as near as he could to the head of the mule, shook himself, and spurted a quantity of water into the mule's eyes, which caused him immediately to shut them. That moment the wolf leapt upon him, and killed the poor mule before the farmer could come to his assistance.

On the 10th of January 1830, a frightful event spread terror throughout the neighbourhood of Eaux-Bonnes, in the department of Basses Pyrenees. The curate of the little village of Aha, situated on the mountain, was returning home on horseback after administering the sacrament, when he was surrounded by wolves, which precipitated themselves upon him and his horse with all the ferocity occasioned by hunger. A number of bones and fragments of flesh which were strewed about, as well as the traces of blood with which the snow was crimsoned, left no doubt of the horrible fate of the unfortunate clergyman, who fell a victim to his pious zeal.

The wolves driven by the cold and hunger from their haunts in the Pyrenees, having spread themselves in vast bands over the country, at the time the above occurrence took place, orders were given at Pau, by the prefect of the department, for a general battue, or chase, on the 22d of January. The country magistrates, having received the instructions requisite for this chase, set out accordingly, accompanied by all and sundry, for the general chase, and relieved the extensive district from these dangerous visitors, by killing many, and driving the rest to their native fastnesses.

M. F. Cuvier relates the following instance of the fidelity and affection of a tame wolf, which was brought up like a dog, and became familiar with every person he was in the habit of seeing. He followed his master every where, seemed to suffer grief for his absence, was obedient to his voice, and differed in nothing from the tamest of domestic dogs. His master being obliged to travel, made a present of him to the royal menagerie at Paris. Here he was shut up in a compartment, and remained for many weeks, exhibiting every mark of grief, and almost without eating. In time, however, he attached himself to his keepers, and seemed reconciled to his fate, when, after an absence of eighteen months, his master returned. He took the earliest opportunity of visiting the menagerie, to see his favourite. At the first word he uttered, the wolf, though it did not see him in the crowd, recognised his voice, and testified his joy by motions and cries. Being set at liberty, he overwhelmed his master with caresses, like the most attached dog. His master being obliged to quit him a second time, the same melancholy symptoms appeared in the wolf, which gradually wore off in time, and he resumed his wonted placidity. At this time a young dog was given him as a companion, of which he became doatingly fond. His master again returned, and in most dogs all remembrance of him would have been lost in so long an absence. He again visited the menagerie to see the animal. It was evening when he reached it, and all was shut up. He spoke through the shutters, and the instant he heard the voice of his master, he intimated his recognition of it, by long and repeated howling, indicative of his desire to get released. The door to his cell being opened, the wolf sprung out, leaped with his forepaws on his master's shoulders, licked his face all over, and when his keepers offered to approach, he indicated his displeasure by exhibiting his teeth, to whom but a few minutes before he had been evincing the most kind affection. Circumstances again rendered a separation necessary, which seemed more deeply to affect the attached animal than on any of the former occasions: he became sad and immovable, refusing all kind of food for so long a period that his death was apprehended. At the end of a week he was literally reduced to skin and bone. He however again rallied his spirits; time softened his grief; and his keepers re-acquired their wonted ascendancy and his attachment.

In the commencement of the reign of Louis the Fourteenth, in the depth of winter and of the snows, a large party of dragoons were attacked, near Pontharlier, at the foot of the mountains of Jurat, by a multitude of wolves: the dragoons fought bravely, and killed many hundreds of them; but at last, overpowered by numbers, they and their horses were all devoured. A cross is erected on the place of combat, with an inscription, in commemoration of it, which is to be seen at this day.

In the summer of 1824, a singular equipage was seen for upwards of six months in the streets of Munich. It was a calash, drawn by two enormous wolves, which M. W. K., formerly a merchant at St Petersburgh, found very young in a wood near Wilna, and which he had so well tamed, that they had all the docility of horses. These animals were harnessed exactly like our carriage horses, and had completely lost their ferocious instinct.

In the Duke of Wirtemberg's castle at Louisburg, is to be seen, among other paintings on sporting subjects, a picture of a black wolf. This wolf was called Melac, which was the name of a French robber, well known at Wirtemberg and the palatinate. Melac used to be the constant companion of the duke, and always slept at his bed-side. He once followed him upon a campaign in the countries beyond the Rhine; but as the armies kept the field till late in the autumn, the wolf was found one day at the duke's chamber in the castle of Louisburg, without any one being able to conjecture how he had crossed the Rhine. In the year 1711, he followed his master to the coronation of the emperor at Frankfort; but being annoyed by the frequent discharges of artillery which took place upon that occasion, he set off privately, and arrived in safety at Louisburg. He remained faithful to his master till his death, but it was not safe for any other person to trust him. Once he bit a piece out of an officer's cheek, without any provocation; and in various other instances he displayed similar ferocity.

* As we design to devote a whole number of our "Information for the People" to "The Dog," it is unnecessary to extend the above sketches with anecdotes of that faithful and valuable animal.

CELEBRATED LIBRARIES.

It is well known to every scholar how intimately connected with the progress of literature is the history of the institution of those great public libraries in which the works of the learned, both in ancient and in modern times, were deposited. Whilst these establishments preserved in safety the writings of those illustrious authors, they afforded the best, and, on many occasions, the only opportunity that mankind possessed of obtaining information. Besides, before the invention of the art of printing, it was commonly in libraries that persons were to be found who were capable of transcribing correctly the works of eminent writers. Copies were thus multiplied, and in such places they were in general only to be purchased.

Books were so dear that hardly any persons, unless such as were possessed of extraordinary wealth, durst attempt to form a library. The most celebrated libraries of antiquity were those of Alexandria, and their history is as disastrous as can well be imagined. The first was founded by Ptolemy Soter about three centuries before the Christian era. It was for the use of an academy he instituted in Alexandria, and by continual additions made by his successors, it at last became the finest library in the world, containing no fewer than seven hundred thousand volumes. In the war carried on by Julius Cæsar, more than the one half were destroyed. Another library in the same city, however, still remained, and here Cleopatra deposited two hundred thousand volumes of the Pergamean library, with which Marc Antony had presented her. Though often plundered during the revolutions of the Roman empire, yet it was again and again repaired. Towards the middle of the sixth century, Alexandria was taken by storm by the Saracens; and for six months the library served to supply fuel to the fires in the city. By this means it was altogether consumed, and the modern world deprived of almost all that the wisdom and genius of the ancient world had produced.

ITALIAN LIBRARIES.

It appears from ecclesiastical history that some Christian churches early began to form libraries. It is probable that the books thus collected principally consisted of the Scriptures, though in process of time some of the works of the most popular fathers of the church might be also included. The places where these books were kept were not called by one name. Sometimes they were called *Archivia*, *Scrinia*, or *Bibliotheca*. These three words seem to have been indiscriminately used, but are always applied to denote the same purpose—a place where books or records were preserved. When the views of the ecclesiastical rulers began to extend, and they aspired to the possession of civil influence and power, they saw the utility and necessity of having some place of safety where their valuable papers might be lodged. They could then be arranged under general heads, and when there was occasion, they could be consulted without much trouble. Libraries did not solely consist of books or treatises upon theology, general literature, history, &c., which was the original design of their being founded, but were also repositories where papers of every description were laid up. Some of the more enterprising popes issued the most express and peremptory commands, that all papers of a certain description (and of which the titles were published) should be deposited in the libraries of the church. The list is by far too long to introduce in this place, but the following is a very brief specimen of the nature of this curious document: It was ordered, that in such places there should be laid up all bonds, bills, deeds, charters, papers regarding donations, exchange of property, traditions, authentic writings of agreements, contracts, &c.

Very considerable expense was necessarily incurred in erecting the building, and in the preservation of the library in some places. Besides, searchers for books, who were called *conquisitores*, were hired at a very high price. It constituted a distinct profession, and none could practise it successfully who had not character, interest, as well as money to advance to the proprietor of the work, as a security that the manuscript should be returned in the same condition in which he received it. The money paid to transcribers amounted in some instances to large sums. According to Eusebius, the Emperor Constantine was very munificent in rewarding both the collectors and the transcribers of books, particularly the sacred writings. For this purpose, money was drawn from the imperial treasury.

By far the largest Italian library, and that which was first founded, was called the Lateran. It was built upon Mount Cœlius at Rome. It is much controverted by different writers in what year it began to be erected. It seems to be impossible to ascertain this, but it does not admit of a doubt that it was very ancient. In the fourteenth century, however, when Pope Clement the Fifth removed to Avignon, in France, he carried this library along with him. After the lapse of many years, Pope Martin the Fifth regained the authority which his predecessors had lost, and a great part of this library was brought back to Rome. It was not placed on the Lateran, but on the hill called the Vatican, where he chose to fix his residence. The books were in the greatest confusion, no steps having been taken to make out a proper catalogue of them; neither was there suitable accommodation for so large a collection. Pope Sixtus the Fourth, who had a taste for literature, being sensible of these and other disadvantages, set himself to correct the abuses which had been allowed to creep into the management of the library, principally through the carelessness of those who had the charge of it. Many of the most valuable manuscripts had been allowed to run to waste through want of air, dampness, &c., but many more had been entirely abstracted, or much mutilated by the hands of men.

Sixtus may be considered as the founder of the Vatican library, for it was he that erected the present building in a convenient situation, so as to be easy of access, and made it of such a size as to be capable of containing the great collection which had been accumulated by his predecessors, as well as the additions that he himself was determined to make to it. He fitted it up with proper book-presses, and other accommodations not only necessary for the preservation of the books, but also suited to the convenience of the learned men who might consult them.

Having proceeded thus far, his next object was to store it with the choicest books which the library most needed, and that he could collect throughout Europe. No person had equal opportunities of doing this to the best advantage as Sixtus. He was at the head of the Catholic church, and was in those days not only supreme in ecclesiastical affairs, but in civil also. He entered with uncommon ardour and zeal upon the enterprise, and his endeavours were accompanied with corresponding success. In a short time, comparatively, it excelled, beyond any sort of comparison, every thing of the kind that had ever been in Europe. It was well furnished with the works of the best and most ancient authors, written on parchment. Their number exceeded six thousand. That the books might be preserved with care, and additions made as opportunities offered, besides liberal donations in his own lifetime, he for ever set apart the sum of one hundred crowns, which the College of the Writers of Apostolic Letters was accustomed to present yearly to the Roman pontiffs. This sum was in that age considerable, and it was to be divided among the chief librarian, the keepers, the correctors, the transcribers, and him whose office it was to sweep the library; but the proportion which each was to receive is not mentioned.

He who presided over the library had originally various duties to perform. He was generally called bibliothecarius, and sometimes cancellarius, or chief scribe, or notary. His business was most carefully to watch over the library, and all the volumes it contained; in short, all its manuscripts, on whatever substance they might be written; also, to write the bulls of the pope, that is, his briefs, mandates, or licences, called bulls, from the leaden and sometimes golden seals affixed thereto; his diplomas or decretals, which was the name given to the letters of popes, and, if necessary, to dictate them; to copy out and preserve the acts of councils and synods; and, in short, to perform all the offices to the Roman pontiff that are now performed by his chancellor. He was considered to be the pope's chief amanuensis, or secretary.

The pope's librarian occasionally received great marks of favour from his employer. Thus, in 1475, Pope Xistus issued a leaden bull, constituting the celebrated Bartholomew Platina perpetual keeper of the library, and allowed him a monthly salary of ten crowns, besides board for himself and his three servants, and food for one horse. He also annexed to his office the royal perquisites which it was the custom to bestow upon the members of the pope's household. These consisted of firewood, salt, vinegar, candles, oil, brushes, and such like. The same Pope Xistus, about forty years after the art of printing had been invented, appointed a Latin, a Greek, and a Hebrew librarian, who had each separate departments assigned to them. Pope Paul the Fourth doubled the salary to a transcriber of Greek manuscripts, and added other three librarians—two who had the charge of the Greek, and one of the Latin department. To each of these he assigned a small salary. He also added a corrector of the Greek books, to whom he allowed ten crowns monthly.

Before and at the revival of learning in Europe, the Vatican library was the place of the daily resort of learned men. No library in Europe contains so great a number of very ancient manuscripts of the best authors who have treated of the different arts and sciences. They are written in very various languages, but chiefly in Greek, Latin, and Hebrew. Many of these are of an older date than any manuscripts which are known to exist, and some of them are *unique*, or to be found no where else.

When literature began to revive, innumerable applications were made to the pope, soliciting him to publish a catalogue of the manuscripts in the Vatican library. The publication of such a work, it was strongly urged, would incite learned men to apply their minds with greater ardour to the illustration of the writings of the ancients. Multitudes would flock to Rome—many Greek and Latin authors whose works had lain hid in obscurity would be discovered—and the errors of such of the editions as had been printed, but were very corrupted, mutilated, and imperfect, would thus be corrected. It is a curious fact in literary history, that the first work of this kind was published at Ausburg, in Germany, but it was after printing was invented. It contained a catalogue of the Greek and Latin classics, as well as of the fathers whose works had seen the light, and the learned were invited to compare the readings in the common editions with those that were to be found in manuscripts. Something similar was also performed by order of Francis the First and Henry the Second, Kings of France, as well as by Cosmo de Medicis, Grand Duke of Tuscany.

Besides the Vatican, there were other distinguished libraries at Rome—such as that of the College of the Canons of St Peter, in the Vatican; that of the very learned Cardinal Sirletus, which was particularly well stored with Greek authors—this library was valued at 20,000 crowns; that of Cardinal Columna; the Sforcian and the Farnesian libraries, which abounded in Greek books. There were also a very great number of private libraries, containing many rare books and precious curiosities. Of this description was that which belonged to Fulvius Ursinus, a native of Rome, and an eminent Greek and Latin scholar. Another was the property of Aldus Manutius, the son of Paulus, and grandson of Aldus, and had been chiefly collected by himself. The learned had at all times ready access to these vast collections. Aldus, who was only a middle-aged man, at his death left his library, which consisted of 80,000 books, to the university of Pisa, in Tuscany. That which belonged to Sirletus was purchased by Cardinal Columna for 14,000 crowns. He appointed keepers to take care of it, with a liberal salary, and also provided perpetual funds for its increase.

There were two other celebrated libraries in Italy, the one founded by the Duke of Florence and the other by the Duke of Umbria—the former remarkable for its excellent collection of Greek books, and the other for its mathematical. The Medicean library at Florence is dedicated by Pope Clement the Seventh to God and the holy guardians of the family of Medicis. The books, he says, were collected from every quarter, and are intended for the honour of his native country and the benefit of his fellow-citizens. Cosmo de Medicis, the grand duke, completed this library upon the 11th July 1571.

MISCELLANEA.

Landing in India.—Nothing can be more ludicrous than a young Englishman's first landing in Calcutta. The shore is thronged with the swarthy natives eagerly awaiting his arrival. Innumerable palanquins are brought down to the boat, and the bearers, like the stage-coachmen where rivalry exists, are all violently struggling to procure a passenger. The bewildered stranger is puzzled which to choose; and when he has made up his mind, he finds it no easy matter to jostle through the countless conveyances which completely surround him. He is also sure to make some laughable mistake in entering the palanquin. It requires a certain tact to steady the vehicle as you throw yourself into it, or it is apt to turn over like a sailor's swinging cot. Another ridiculous error which a stranger is liable to, is his endeavouring to seat himself on the little drawer inside, supposing it to be intended for that purpose. But he soon finds, after having doubled himself up like people passing on a coach-top under a low gateway, that it would be utterly impossible to remain long in that position, unless the human back were as pliable as a piece of whalebone. After all, perhaps, the bearers are compelled to rest the palanquin on the ground, and the abashed stranger, creeping hastily in, is glad to escape from the ill-suppressed smiles of the surrounding multitude.

Magna Charta.—It is remarkable that the original of this great charter was suffered to remain in private hands. When Archbishop Laud was committed to the Black Rod, it is thought that Warner, Bishop of Rochester, whom he sent to secure his important papers, removed this among the rest. However this may have been, it was given to Burnett himself by Colonel Lee, a descendant of Warner. What has now become of it?

Athenian Soup.—The Athenians sometimes had their soups served up in the stewing-pans in which they were made. The form of these utensils resembled that of our tureens, and the material was a kind of porcelain. It appears also from Plato, that the spoons were of sycamore, as that wood was thought to communicate a better scent and flavour to the soups.

Alexander the Great.—When Alexander was suing for divine honours, and the Athenians wished to testify their independence by refusing him a place in the skies—"Have a care," said Demades to them advisingly, "lest, when you seem to guard heaven, you in reality lose earth!"

Reply of Archelaus.—A garrulous barber, happening to be called to shave Archelaus, asked him, "How shall I shave you, sir?" "In silence," was the reply.

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.

Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS'
EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 79. SATURDAY, AUGUST 3, 1833. PRICE THREE HALFPENCE.

GRATITUDE.

HARDLY any bad thing is so much exclaimed against as ingratitude. It seems to be not only very ill taken by those who are its direct objects, but also by all who hear of any instance of it, as if every human being were interested in the exhibition of a contrary feeling, and felt injured when it was not shown. "Ingratitude!" nine out of every ten persons will cry, when the subject is but mentioned; "it is the basest of all sins. Do not let me ever hear the name of an ungrateful person." Certainly, to be so common a sin, it is one which meets with amazingly little excuse or allowance. In this, of course, there must be some fallacy, some blindness, something of some kind or other, which prevents men from seeing the fault in its proper light; for how, otherwise, should every one be ready to condemn a sin, which, from its universality, must in all probability be as characteristic of himself as of his fellow-creatures?

The truth seems to be, that, if there is much ingratitude in the world, there is as much of an unreasonable expectation of the reverse—and hence a great deal of the disappointment when the reverse is not shown. Favours are not often conferred in a right spirit. They are sometimes given from a mere want of estimation for the things bestowed, sometimes for the sake of inducing greater favours in return, sometimes in the vain hope of procuring a greater friendship from the person favoured than what he has it in his nature or in his convenience to bestow, and very frequently that is given which the other party did not want, did not seek for, and cannot be benefited by having. To make these facts quite clear, let us just recollect the difference between what we generally give for charitable purposes, or when a person really in need of a favour applies for it, and what we are in the habit of expending when we are anxious to entertain or give a present to a person of our own or a superior rank, who neither requires nor requests it. It is not unreasonable to say, that we give to the necessitous in copper and silver, to the non-necessitous in gold. But, indeed, the remark is much older than our day, and must be familiar to every one, that the surest way to obtain a favour is to seem not to need it; the converse of which is, that, if we really need, we never get, all mankind being bent only on favouring those who can make a suitable return, or upon whose minds, at least, they desire to make an impression favourable to themselves. Now, if favours are not conferred in a right spirit, how is it to be expected that in a right spirit they should be received?

No doubt, many persons who were succoured in need, and from a spirit of pure benevolence, have made an ungrateful return. But then we should recollect, that the very circumstance of having been obliged to accept a favour, however put up with in the moment of need, is almost sure afterwards to produce a feeling of such an uneasy kind, that men naturally endeavour to lessen the favour in their own recollection, and, upon any feasible excuse, to throw it off altogether. Persons in the way of conferring favours tell us that there is always enough of gratitude at the time when the favour is conferred, or so long as its beneficial effect is felt, but that it always grows fainter and fainter, until at last it dies quite away, or even degenerates (and this is what surprises them most) into a feeling of absolute dislike and hostility. It may be said, in palliation of this charge, that the perpetual homage which is implied by gratitude is a price so dear, that men cannot be properly expected to pay it for any kind of favour. There ought most unquestionably to be a limit to the duration of this deference of spirit, proportioned to the value and benefit of the action by which it was called for; otherwise, accepting a favour becomes equivalent to a selling of the soul into slavery. Now, is it not as often from an undue desire to continue this painful yoke upon the necks of those we have benefited, as from an undue desire on their part to shake it off, that we complain of ingratitude? Is it not in general from actual suffering under this yoke that the persons benefited have at last conceived a feeling of dislike towards their benefactors, and expressed it in actions the very reverse of those which were expected? And, after all, is it clear, in any instance of a favour being conferred, which is the party from whom the gratitude is due? May not one man sacrifice more of his sense of dignity and independence in being the apparent receiver, than the other sacrifices of a meaner kind of property in being the apparent giver; and may not the latter have the most pleasure and benefit in proportion to the expenditure? At the very best, the thing bargained for by the giver is of a vague and indefinite nature, and there is nothing so natural, as, where the price is not exactly defined, for the parties afterwards to fall out about the settlement.

The spirit in which favours ought to be conferred, and in which they are conferred by all really good and rational persons, is one which in a great measure precludes the expectation of gratitude. Good should be done for its own sake, and not from any paltry motive of interest; neither from a desire of bringing back good to ourselves, nor from a wish to acquire a sense of superiority over those we benefit, nor for any other reason or object whatever, than simply that evil may be obviated, and that the great ends of the Giver of all Good may be served. In order to make a good action perfect, it would almost be requisite that we did not know what individual was the better of it, so that it might run no risk of being diminished or depreciated by our afterwards solacing ourselves with the incense of a humbled man's thanks. Let us be as much as possible the unseen instruments of good; and the benefited persons, though they might have fretted under a sense of obligation to us their fellow-worms, will repay it a hundredfold by the devotion which it will excite in their hearts, towards the Deity who gave us the means and inspired us with the wish to aid them.

DRESS.

IN dress, man is entirely subservient to custom; in almost every other thing he exercises his freedom of thought and free will, and ventures to act for himself: He will have a government after his own mind—a religion according to his conscience—he changes the form of his houses and grounds as his fancy dictates—he leaves off one particular department of study, and resumes another, according to inclination—he even makes a total change of his food according to the caprice of his appetite—and yet this same man continues, month after month, and year after year, to put on just such a cut of coat, or figure of other habiliments, as are sent home to him. In short, he is the mere creature of the caprice of his tailor, or, if of the other sex, the implicit adopter of the more fantastic fancies of the milliner.

When we say that the dress of this country is never varied, we mean in all that constitutes its essential and general features; as to minor details, the variations are never-failing and endless; and yet, perhaps, there is no dress throughout the whole world which will be found less comfortable, less appropriate, or less graceful, than that which now and for several centuries has prevailed in modern Europe. In all the essentials of dress, it is inferior even to that of the rudest nations made known to us by modern discoveries. It is inferior, as being stiff and uncomfortable, as being decidedly ungraceful, and as being little suited to convenience or health. Compare the dress of an Otaheitan savage as described by Cook, and how superior in every point of view it is to that of their more civilized visitors and discoverers! How flowing and graceful were the vestments of the ancients, as handed down to us by the descriptions and paintings of cotemporary historians and artists—such, for instance, as those of the Greeks and Romans—and what a dignity and simplicity is embodied into the cartoons of Raphael, by his adoption of this mode of dress for his figures!

Although the human body is the most graceful and most majestic object that nature presents to our contemplation, yet it is evident, that, unlike all other animals, man was formed destitute of any external covering, in order that he might clothe himself by his own ingenuity and labour; and neither decency nor convenience allow the state of complete nudity. A covering of some kind or other, then, is necessary; but its form and proportions being left to the general taste, depend upon opinion and circumstance. That sort of clothing which fits the limbs and other parts of the body exactly, and shows their natural form and proportion, is not unbecoming, although it must in some degree tend to impede the full play of the muscles and action of the body. That which floats in light drapery around the body, and rather shades than conceals its outline, is highly graceful, at the same time that it allows of the utmost ease and freedom. That which covers the person entirely, and folds the whole man up in his garments, is cumbrous, and, if not managed with unusual art, borders on deformity.

The first or close dress was, according to Tacitus, the manner in which the nobles among the ancient Germans were clothed, and is still, to a certain extent, the national dress of the Hungarians, which is imitated in the uniform of our hussars. The second, and most elegant, was the dress used by the Greeks and Romans, and, as far as we can understand, seems to have been the prevalent dress among the nations of antiquity. The Roman dress consisted of the toga, a flowing robe of white woollen cloth, which covered the whole body, drawn up and suspended over the left arm, but leaving the right at liberty; below this was worn a tunic, or closer garment, reaching to the knees, and bound round the waist by a belt. The third, or full and flowing dress, enveloping the whole body, is that of the oriental nations, and is seen to this day among the Turks and Persians. After the revival of civilization and commerce in the middle ages, a richness and magnificence of dress was in vogue in Europe, without much regard to taste or elegance, and consisting of a combination of some parts of the ancient Roman, with modern innovations. The Spanish dress prevailed in Europe and in England during the reigns of the last Henries and Queen Elizabeth, but after this period the French costume was introduced, and has ever since prevailed, and continues to extend over the civilized globe. If we take a dispassionate view of this dress, and especially as it prevailed in the last two centuries, nothing can appear more unnatural, constrained, or ungraceful, and nothing more at variance with the graceful and flowing outline of the human form. Indeed, our modern dress is so managed as to conceal all the bendings and waving lines that naturally grace the human exterior, and to replace them by numerous angles, bundles, and knots. Thus the neck is wrapped up in a bundle of linen, or encased in a stiff collar of buck-

ramed and padded stuff, that completely destroys its free and graceful motions. The shoulders, arms, elbows, and wrists, are all rendered of one uniform thickness, by a stiff-cut or preposterously wide sleeve. The knees are stiffened and cramped by buttons and buckles, or long shapeless trousers take away all figure or proportion from the waist down to the sole of the foot. The coat is the most ridiculous thing imaginable. It has neither length nor breadth to answer the purpose of drapery, and it is marvellously so contrived as to hide all proportion of figure. Its extremities are all straight lines and angles; its collar is a monstrous and superfluous appendage to the neck; its breasts are nicked out into triangular ornaments, and stiff rows of buttons run up and down both fronts, while behind, two perfectly superfluous ones stare out like the glittering eyes of an alligator. The waistcoat has the same defects, in a smaller degree. Shoes are most ingeniously contrived to cramp the toes, thereby disfiguring the natural shape of the foot, and causing incurable lameness, or they are raised on high heels, with a narrow instep, as if to aid in walking were not at all a requisite in their adoption. As for the head, which is confessedly the crowning glory of the human figure, and which nature has so beautifully shaped and adorned—which is the seat of grace in youth, of reverence in age, of beauty in the softer sex, of command and majesty in the other—the head is encumbered with all the deformities which human grossness can devise. What, in the whole works of art, is more unnatural, stiff, and uncomfortable, than a modern hat—a mass of glue, paper, and wool, formed into a cone or circle, with hard lines, and stiff and unyielding corners, presented to the view on all sides, without beauty, or grace, or comfort, or even use, liable to be blown off with every gust of wind, cramping the head, and serving not only as a complete attraction for the rays of the summer sun, but forming a reservoir of heated air, which continually annoys the wearer. If we turn for a moment to the bonnets of the other sex, here matters are no better, but even worse. Here huge unshapely masses of silk and pasteboard, or stiffened or plaited straw, tower upwards and around for many feet, without beauty, or grace, or proportion, presenting a mark for every gale to waste its breath on, and enveloping the countenance beneath in disfiguring shade and oblivion. We need not speak of the barbarism of modern caps, laces, and ribbons, arranged with all the profusion and bad taste but too often conspicuous. But if we turn back for half a century, we come to even greater follies. We then come to an age of painted faces, hardened hair, overflowing wigs of horse hair, curled and twisted into all the most fantastic modes, and tied up into lengthened tails, like that of a monkey: then was the age of hoops, furbelows, and high-heeled shoes, and of bag wigs, cocked hats, and swords. That such absurdities existed, could scarcely be believed even in this age, when taste in dress is yet at a low ebb, did we not see the proofs of it in the portraits of the day, and in the mimic representations of the stage, handed down faithfully from one generation to another.

Now, nothing can be more absurd than this perpetual tampering with dress, and alternation of fashion in our habiliments—this changing of the simplicity and beauty of the human outline into the likeness of a monkey. As there is a standard of the human figure and proportions which nature uniformly preserves, so there must be an appropriate standard of dress suited to these proportions, which ought to be beyond the innovations of false taste, caprice, and professional cupidity. We doubt not that all ridiculous fashions have had their rise from two sources. In the first place, the deformed, ugly, and ill-shaped, invent dresses to conceal their defects, and, if they are of sufficient influence in society, impose these dresses upon the well-proportioned and beautiful, in order to reduce them to their own standard of deformity. How else can we account for large ruffs round the shoulders and neck, stuffed and padded clothes, paint and patches for the face, powder for the hair, artificial curls and wigs, hooped petticoats for the fat, high-heeled shoes for the lame or dwarfish, and all those unaccountable freaks which the history of dress and the experience of the present day point out to us? The second cause of fashions arises from the cupidity of tailors and milliners, who drive a lucrative trade in their monthly alterations of the cut or colour of their various commodities, aided in their fancies by the extravagant tastes of silly and empty-headed ladies of fashion, and gentlemen of the ton, who pant for distinction in the only field open to their capacities. In this way, it is humiliating to the dignity of human nature to witness how wise men and fools, mighty senators and judicious matrons, as well as empty blockheads and uninformed misses, are all brought to a uniform level of absurdity. A man of sense either does not give himself the trouble to dictate about the cut of his coat, or has not courage to be so singular as to dress according to his inclinations, and hence becomes the prey and tool of his tailor. As we have already remarked, while the church and state, and arts and sciences, are daily receiving amendments, the consideration of dress has never yet been projected. How can we ever expect any indications of taste or elegance in dress, then, when the imposers of the fashions are such as we describe? As long as there is no standard, all must join the current of the day—as well those who have taste and discernment, as those who have neither. For instance, one of the chief beauties of the female figure is the smallness and roundness of the shoulder, compared to the breadth and muscularity of those of man; but in our present dresses, every pains is taken to swell out and amplify the female shoulder, until the figure becomes an inverted cone, with the broadest end upwards; thus doing away with that beautiful and appropriate distinction which nature has set between the two sexes.

In the reformation of dress, then—an event which will perhaps take place as soon as common sense is sufficiently diffused—the circumstances to be attended to are, comfort, healthfulness, elegance, and propriety; happily, all these are compatible with, and indeed arise out of, each other. Females, above all others, especially those who take little exercise, should be warmly and comfortably clothed; the same is the case with children, they, as well as the aged, being peculiarly subject to injury from cold. As little difference as possible should be made in the principal parts of dress in summer and in winter, for in this climate summer may prevail during the day, and the chill of winter succeed in the evening. The great elegance of dress generally consists in its simplicity, and this applies to shape, colour, and ornaments. The most appropriate colours are the subdued, and a dark colour generally sets off the human figure to greater advantage than a light. Mixtures of gaudy colours should in every case be avoided. If we were asked the most appropriate colours for a beautiful person, we would say, either snow white or black, very slightly relieved; and in its fashion we would again inculcate simplicity; for beauty needs not the aid of ornament.

ELIZABETH LATIMER.

It is hard, that, with man, talent, combined with perseverance, should be almost omnipotent to overcome obstacles the most numerous and formidable, while in the hands of woman, it is often wholly useless, unless fortunate circumstances, such as wealthy or literary connexions, obtain for the possessor the opportunity of gaining by its display, fortune and fame. Few and rugged are the paths by which her genius, unaided and alone, may climb even to competence.

Such an isolated being was Elizabeth Latimer, who, at twenty-four, found herself in possession of an accomplished mind, a memory stored with reading of the best kind, and a judgment accustomed to exercise itself from its earliest developement; and this, with a graceful person, and a countenance of great sweetness and intelligence, was pretty nearly all that Elizabeth possessed. She had been for many years the only daughter of a merchant, who, though he did not, like some of the merchants of Boston, draw his resources from all the ends of the earth, yet possessed enough for the indulgence of luxury. The indications of talent which he very early discovered in the young Elizabeth, determined him to bestow on her an education that would save her from adding to the number of those precocious geniuses, who, from a misapplication of their powers, become unfit either for the daily concerns of life, or to hold a place among those who are gradually procuring indulgence and respect for female intellect.

We will not detail the progress of Elizabeth's studies. They were such as opened her young mind to all that was lovely in virtue, and lofty and excellent in intellect. She lived principally in the country, in a small but intelligent circle, sufficiently enlightened to save them from the dominion of a gossiping spirit, yet not so learned as to allow her to acquire any thing like a pedantic one.

The tranquillity of their own house had received a startling shock when Elizabeth was about fifteen, by Mr Latimer's bringing home a second wife, very little more than her own age, but of entirely different temper, habits, and tastes. It was then that Mr Latimer perceived that he had done wisely in giving to Elizabeth habits by which she could abstract her thoughts from the jarrings of a stepmother who was jealous of her. But their school of trial did not last long. Mrs Latimer only lived to present her husband with a son.

When Elizabeth entered into society, she carried with her many warnings from her father to avoid the display of acquirements which were not common to all. She listened, determined to profit by his advice, though she felt there was some injustice in laying this embargo upon wit and learning. But poor Elizabeth found herself sadly at a loss when she encountered a bewildering number of new faces, whose ready smiles and pliancy of expression concealed all that was passing in the heart. She felt it as impossible to catch the light tone of those around her, to talk of nothing, to express rapture and enthusiasm where she felt only indifference, as it would have been for one of the gay circle to have shone forth as an improvisatrice. Being perfectly unaffected and simple, she took refuge in silence; but her speaking countenance often betrayed the listlessness she felt.

We seldom reflect long, amid the enjoyments of affluence, upon their precarious nature. Elizabeth retired from the world, and devoted herself to her father and to the education of Louis, her brother, whom she loved with all a mother's tenderness. He was indeed a sweet and gentle child, fond only of books and sedentary amusements, and Elizabeth's time passed away as happily as time passed in the exercise of duty usually does. She was often uneasy, often tormented by vague fears of future poverty and distress, but these were only clouds that overshadowed her at times. Her horizon generally was bright; but the blow anticipated fell upon her at last. Mr Latimer had ventured his fortune in a speculation which was to enrich Louis and his posterity for ever.

After many months' suspense, the news reached Mr Latimer that he was ruined. He did not long survive it, and his son and daughter found themselves friendless and poor. A few hundred dollars was all that could be collected for them, nor had they any claims upon others. They had but few family friends, and Elizabeth's was not a spirit to brook dependence. Poverty at first sight is not so frightful as when it comes near enough to lay its cold, griping fingers on us; and, in the present excited state of her feelings, the prospect of maintaining herself did not appear so difficult as she afterwards found it.

Mr Latimer had insisted, some months before his death, that Louis should be placed at a large public school. Elizabeth had consented to his plan with readiness, though it grieved her to part with the little companion whose quickness enabled him to catch with facility every thing she taught him; but she was aware that a public school is indispensable towards acquiring manly habits, and that independence of ridicule, which are necessary to all who walk the world, however retired be the path they choose.

It was evening, and she was alone when she took possession of two small rooms in Darton Street. Dull and dreary was the aspect of every thing. The window of the little sitting-room was close to a high stone wall, nor were light and beauty shut out from that entrance only. From her chamber window nothing could be discerned but a long range of warehouses. There was not even the sight or sound of labour to cheer the prospect. "A cobbler or a blacksmith would enliven the scene," thought Elizabeth, "but I hope I shall not stay here long." Her first attempt to escape from her new dwelling was a letter to a lady with whom she had long been intimate. Her plan was to open a school, and she solicited Mrs Graham's assistance, or rather patronage, without taking into consideration how little that lady had to bestow. She answered Elizabeth kindly, explaining to her that her influence was confined to five or six families, none of whom had it in their power to engage for their children an instructress whose accomplishments would entitle her to a higher salary than is given to those who teach the elementary parts of education.

Over this first disappointment Elizabeth did not long weep. Keeping a school is a very depressing prospect, and she felt almost relieved by Mrs Graham's letter.

Her next application was to a lady who was desirous of procuring a governess for her daughters—one of those ladies whose *beau ideal* of a governess is that of a being with every talent and every virtue under heaven, combined with a degree of humility that will endure every insult that narrow minds bestow upon the unfortunate.

One lady objected to her because she could not teach velvet painting. It was in vain Elizabeth, who liked the mild tones of this amateur in footstools and sofa covers, urged the superiority of the higher branches of painting. "That might do for artists," said the lady, and Elizabeth took her leave. Another expected her to teach embroidery and shoemaking to six daughters; but the most fatal bar to her success was the want of a knowledge of music.

After many failures she relinquished the hope of obtaining a situation, and turned her thoughts to her last resource. She determined, with a heavy heart, to offer her services as a translator to a publisher whom she had often heard spoken of as a man of taste and liberality. Translating is a fatiguing and inglorious task, but she had no alternative. While she was hesitating whether to address him by letter or apply to him in person, Mr Warren was announced. Elizabeth knew him well, for he had been a frequent visitor at Mr Latimer's. He was remarkable only for his extreme dullness, and his desire of being thought a man of genius and learning. He picked up scraps from pocketbooks and newspapers, and wearied his friends by commonplace remarks, uttered in a tone of oracular wisdom. His address to Elizabeth was hesitating and confused. He proposed—and how infamous the proposal—that Elizabeth should write papers for him, of which he should appear as the sole author; and in the meanwhile left her to make up her mind.

"He has made me laugh, at least," said Elizabeth, after his departure. "I always thought him a fool, but never expected such an excess of folly from him; but it will cure me of attempting to set bounds to the folly of a foolish man."

She then threw down her pen, and abandoned herself to despondency.

By the time Warren returned, Elizabeth had so balanced the advantages of his scheme against its objections, as to give him the assent he expected. His presence revived the ridiculous ideas that his proposal had at first suggested. The tone of his voice was expressive of extreme dullness, and there was a stupidity about him that completely oppressed Elizabeth. She began to be ashamed of acceding to his plan, doubting, indeed, if any production, supposed to be his, would obtain a reading from the editor. However, a short time would decide her fate, and she resolved to make the experiment. She inquired beforehand what was to be the compensation for her trouble. He named

the probable sum. "You rate intellectual labour very low," said she; "but no wonder. However, that, four or five times repeated, will be enough for my purpose. You are aware that you must furnish me with books. I must have a great many authorities to bring to the field. A man like you will be expected to be very accurate." He professed himself willing to be guided by her in every thing, begged her to try and catch his style, and urged her over and over to exert herself to the utmost, before he relieved her of his presence.

Though Elizabeth wrote with facility, she was obliged to refer to so many authorities, to correct and strike out so many redundancies, that she sat up a great part of the night previous to the latest day on which Warren was to call for her little essay. It was finished at last, and she committed it to its trial with a beating heart.

Great was the astonishment of the editor when Warren presented himself in his library with a manuscript of an imposing size in his hand. Greater still at sight of the subject; and it rose to its highest pitch after reading the first few sentences. He knew little of Warren, but he had always heard his name used as a synonyme with dullness, and he was betrayed into abruptly exclaiming, "Mr Warren! I had no idea—I mean I did not expect—Mr Warren, is this yours?" The blush of guilt flew to poor Warren's face, but Mr Leslie hastened to apologise. "Leave it with me for an hour or two," said he, "and you shall hear from me to-morrow."

Elizabeth had once before charmed Mr Leslie by the playfulness of her conversation, and the occasional acuteness of her remarks. There was a nameless something in her style that pleased him, and he accepted Warren's production without hesitation, determining, at the same time, to vindicate him from the charge of ignorance and stupidity.

As soon as Warren received what gave him a delight, he hastened, in a transport of generosity, to divide it with Elizabeth. It was more than she had hoped for, and the consciousness of possessing the means of contributing to her own support, gave an exhilaration to her spirits to which she had long been a stranger. She walked to the school where Louis was making a progress that repaid her for parting with him, and paid, with a thrill of delight, the first fruits of her industry to his master.

She continued to supply Warren with materials for the fame he was acquiring, though there were times when Mr Leslie strongly doubted his positive assertions that he was the author of the manuscripts. There was a taste, an elegance in their style, and a sensibility, that he felt never came from the coarse mind of Warren. However, he had no means of elucidating the point, and gave it up, hoping that accident might one day or other expose the deception.

In the meantime, Warren, who began to find the sums he received from Mr Leslie extremely convenient for his own purposes, began to reduce Elizabeth's share to a third, and then a fourth of the whole. "She cannot want much," he argued with his conscience, "living in those little garrets. I don't see how she can possibly spend five dollars in six months, and always plainly dressed too. I really think I give her more than enough. I dare say she can manage a little to great advantage."

People who are extravagant themselves are often wonderfully ingenious in devising plans of economy for others. Elizabeth was surprised at this falling off; but, in the simplicity of her heart, she never suspected him of such a pitiless fraud. "I have overrated my own productions," said she, "and yet I certainly think I have improved. I have studied the rules of good writing; I read with a deeper spirit of observation; it is strange my pieces should appear of less value to the publishers in proportion as they seem to me more spirited and better finished. Perhaps they are thought studied. I myself find a sameness in them."

A year passed on, and she found that she had just enough to defray Louis's school expenses, and nothing to lay by towards sending him to college. Her health, too, was impaired by constant application, and her spirits crushed by the unvaried sameness of her employment. She felt her health languish: her head ached incessantly; but still she went on for several months. On one occasion she called at Mrs Graham's, where she expected to meet her early friend Mrs Leslie, but was disappointed. In a conversation which ensued in her presence between Mrs Graham and her husband, relative to the pieces she had written, and which were said to be by Warren, she overheard Mr Graham remark, that Warren had boasted to him, in Mr Leslie's library, of having made two hundred dollars in six months by his productions—a sum far greater than she had received.

It is impossible to describe Elizabeth's indignation at learning how she had been deceived. She did not hesitate a moment how to act. Warren was to call the next morning for some manuscripts that she had ready for him, and she determined to speak to him of the baseness of his conduct, and break with him at once. But there is something in the mere presence of a fool that blunts our most eloquent reproaches. It would be absurd, she thought, to talk to him of defrauding the orphan; it will be enough to tell him he has acted dishonestly, and that I will no longer "lend him my pen."

Warren turned pale at her stern inquiry whether he had fulfilled his promise of giving her whatever he should receive from the editor. He solemnly declared that he had done so, but Elizabeth stopped him short by repeating, word for word, the conversation that had passed in Mr Leslie's library. "Now, Mr Warren, after this it is impossible that I can continue to give up time and health for you. You know the object of my labour; you know my anxiety to procure for Louis the advantages of a good education, and you have enriched yourself at my expense. Find somewhere else a pen that will be at your service; mine writes not another word for you." It was in vain Warren entreated, promised, swore. He even knelt to conjure her to retract. He offered to refund, to pay most liberally; but she was inexorable, and he was obliged to depart, cursing his own folly for boasting.

And now, what was to become of Elizabeth? She thought of sending her papers to Mr Leslie, but that would instantly betray Warren, and she had promised him to be silent. She was strongly tempted, but resisted. "He has behaved ill to me, certainly," said she, "but I must not, on that account, forget my own principles. It is the spirit of retaliation that makes dishonesty travel on like a snowball. I must not think of such redress; but what am I to do? The Grahams have already proved their inability to assist me. However, 'God tempers the wind to the shorn lamb,'"—and, hurrying to her room, Elizabeth put on her bonnet, and set out for the publisher to offer herself as a translator. In this species of writing she had the good fortune to find some employment from Mr Carlier, a bookseller. But her task proved tedious and difficult. Eighteen months of seclusion and application, uncheered by success, and rendered still more painful by the privations to which poverty is liable, had destroyed the vigour of her mind, and injured a frame that had never been robust. Her headaches were so frequent and so intense that she frequently spent whole days in correcting the mistakes of the preceding ones. The very attitude necessary for writing gave her pain, but she felt that she could not stop, and some days after the time appointed by Mr Carlier she walked with a beating heart to his house with her translation. She was shown into a parlour at the back of the book-shop, where she sat absorbed in her own feelings, unconscious that she had drawn the attention of a gentleman who entered some moments after her, and who stood gazing with painful interest upon her anxious and excited countenance, which he was sure he had seen before, but could not recollect when or where. And, indeed, Elizabeth was changed since he had seen her last. The calm, high, meditative brow was now contracted by pain, and care had dug caves for those once placid eyes. She sat leaning her head upon her wasted hand, lost in her own anxious thoughts, till Mr Carlier came in.

"Ah! you have brought the translation. However, I have changed my mind since you were here last." Elizabeth, who had learned to anticipate injustice, lost all self-command, and clasping her hands, burst into a passion of tears. "Nay, do not suppose," said Mr Carlier, distressed at his own abruptness, "that I have forgotten our agreement. I have no idea of depriving you of the price of your labours."

He unlocked a desk, and took out bills which he put into her hand, saying, "I only meant to tell you that I have deferred the publication of this work for a few months, as there are so many new books in the press."

Elizabeth hardly heard him. All she thought of was to be at home, and alone. Yet still the future occurred to her. She offered her address to Mr Carlier, saying, in a voice of hopelessness, "Should you have occasion to employ any one in the drudgery of literature, in copying, correcting"——she paused, feeling as if she were soliciting charity. The card dropped from her fingers, and she hurried away.

Mr Leslie, for it was he who had been an unobserved spectator of Elizabeth's distress, took up the manuscript that lay on the table. "A singular young person, that," said the bookseller; "I must try and find her some employment. Yet I cannot understand how such an elegant and accomplished woman should be in such extreme distress. But what astonishes you?" for, as soon as Leslie had cast his eyes on the handwriting, he recognised that of Warren's manuscripts. Every thing was the same—the folding of the paper—the very silk with which it was fastened. There could be no doubt as to her being the charming writer he had so long wished to discover. "Latimer!" he exclaimed: "surely this must be the daughter of him who was involved in the ruin of B—— and T——."

Upon making inquiries, Mr Leslie found that she who was now struggling with poverty and neglect had once been among the favourites of fortune. He described to his wife the scene in Mr Carlier's parlour, and she readily joined with him in the wish to serve Elizabeth. But it was too late to serve or save. She had returned to her lodgings, and, throwing herself upon her bed, gave way to utter despondency. A low fever had been for some time hanging about her, and she now lay down, expecting to rise no more.

Elizabeth had not moved from the spot where she had first thrown herself, when her landlady announced Mr Leslie. His name excited no emotion. She rose mechanically, and went down. Leslie had been examining the books which crowded her little apartment, and every thing he saw convinced him that he was right in his suspicions. He delicately stated to her his discovery, and expressed a wish to remove her to a station where her talents might procure for her competency and respect. The words sounded like mockery to Elizabeth. Her mind was in that state of abandonment and depression, that, had the honours and riches of the world been within her grasp, she would not have extended her hand.

Mr Leslie proceeded to offer her the superintendence of the education of six young ladies, all of that age when a desire to learn saves the teacher an infinity of trouble. She was about to decline, but the thought of Louis roused her. She lifted her languid head, and attempted to thank Mr Leslie. "Yet give me a short interval of rest before I begin any new employment. It will be but short, for now I feel as if the prospect of accomplishing the first wish of my heart will give me new life and spirits. It is not to contribute to my own necessities that I have struggled with misfortune; but I have a brother dependent upon me—a boy of such uncommon abilities, that I feel it would be neglecting one of Heaven's best gifts, were I to repress them by devoting him to an employment better suited to his circumstances." "This, indeed," thought Leslie, "is woman's love! This is woman's pure, self-sacrificing spirit! That which has supported the sage in his dungeon, the martyr at the stake, and many a misnamed hero, is not wanting here. She is satisfied with her motive, looking forward to a reward so uncertain as the promise of talent in boyhood—a promise as deceitful as the winds or waters."

He left Elizabeth with excited hopes, that prevented her from feeling for some hours the fever that was preying upon her. But the hour of re-action came. All night the wild images of delirium danced before her tortured eyes; and on the morrow, when Mrs Leslie called to invite her to her house, Elizabeth's ear was deaf to the soft voice that tried to awaken consciousness.

As soon as she was well enough to bear removal, Mrs Leslie carried her into the country, where the sight of the green hills and slopes made her feel as if she could again brush the dew from their summits; but even Nature—beautiful Nature—once so beloved, and, during her long gloomy hours in Darton Street, so anxiously pined after, failed to restore elasticity to her step. It was autumn, a season she had always loved. But now, those softly shaded days, which once filled her heart with a pensiveness that she would not have exchanged for mirth, gave a chill to her frame as though the season had been December. Elizabeth felt that her race was run; but the heart, where despondency had long made its cheerless abode, was now soothed by the new and welcome feelings of gratitude and love. Mrs Leslie was one of those benevolent beings who seize upon our affections as their right. The heart gave itself up to her with perfect confidence. The greatest sceptic as to the existence of virtue could not look upon her open, candid countenance without feeling staggered, nor witness the happiness she diffused around her, by the influence of a heavenly disposition upon the daily events of life, without feeling that the source from whence they flowed was pure.

"Look, dear Elizabeth," said she to her languid pale companion, as they were returning from an excursion to some of the beautiful villages on the Connecticut; "Look! that is Mount Holyoke. He overlooks my native village. I hope the time is not far off when we shall climb his rugged sides together." Elizabeth shook her head. "Do not deceive me. I feel that ere long I shall be no more. And yet I cannot say I die without regret, for I am yet young, and youth, even though oppressed with care, shrinks back at sight of the grave. Yet, as I feel drawing nearer to it, much of the fear that it once excited subsides, and, perhaps, before my last hour comes, I may cease to think even on Louis. Poor Louis! if I could have lived a few years longer."

Mrs Leslie wept. She understood how dreadful was the uncertainty of Elizabeth's mind as to Louis, and she lost no time in consulting her husband about removing the only weight from her heart. He willingly agreed to her benevolent proposal, and that very evening Elizabeth was made happy by his assuring her that Louis should receive the same advantages of education as his own son. She could only weep, and press their hands.

Elizabeth lingered only a month longer. The Leslies would not part with her, and their attachment grew stronger as the object of it was fading before their eyes. There were times when all her delightful powers seemed renewed; when the treasures of her memory and imagination charmed away the winter evening; but the flushed cheek and glittering eye warned them that the lamp of life was burning fast away.

One evening she left the drawing-room earlier than usual. Mrs Leslie saw with alarm the extreme paleness of her countenance, and, after a few moments' hesitation, followed her to her chamber. She paused a minute at the door, for Elizabeth had sunk on her knees at the foot of the bed. One arm hung by her side, her head had fallen on the other, which she had flung across the bed. Mrs Leslie trembled as she saw her motionless, then rushed forward; but the hand she grasped was icy cold. The spirit had quitted its earthly tabernacle for ever.*

BALLATER.

Our readers are aware that we have lately made some pretty excursions in the North Highlands, and especially along the banks of the Dee, noticing such remarkable matters as have come in our way. It has, perhaps, been remarked, that on these occasions we have not paid due respect to the celebrity of the village and watering-place of Ballater, the capital of Deeside; and we hasten to make up the deficiency. Ballater is a village situated forty-two miles west from Aberdeen, and is placed on a plain of considerable dimensions, far wider and flatter than such as are generally to be met with in the Highlands. Being now resorted to by real or supposed valetudinarians as a watering-place, and of late erection, it forms a striking contrast in its neatness and regularity to Highland villages in general. It is indeed quite an "oasis in the desert." There is something gratifying in its sweet lowland appearance, as you approach it after the dreary wilds you have just traversed. The steeple of the village forms a prominent object; then through the trees you remark neat white regular rows of small houses; and, with the assistance of the stream and a noble bridge —now, alas, a victim to the floods, but soon to be rebuilt—the extent of the wild plain on which it is situated, and the mountains around, might have given you the conception of a trans-Atlantic city suddenly reared in the midst of the desert. On the north side of the village is the steep round rock called Craigendarch, and on the opposite side of the river is a line of steep banks covered with pine to the height of some eight hundred feet. But the background towards the west is the most striking portion of the landscape. The highest and most marked object is the princely brow of the great Lochin-ye-gar looking down with calm majesty on the lesser hills, over which it is so much raised as to appear visible from its summit to its base. It is of considerable length, and the front is a flat wall of precipice here and there streaked with snow, while the outline rises at each end with a fine sweeping curve, terminating near the middle of the ridge in a sharp peak. From Lochin-ye-gar the hills descend by a sort of gradation, until they sink into the plain on which Ballater is situated. They are of great variety of form, and we might tire you by describing the numberless beautiful curves in their outlines. Let us add to this picture the Dee wandering round the bases of the smaller hills, here gurgling, there calm and smooth; with the pine, the weeping birch, and the dwarf oak, hanging over its edge, and casting on its waters a deep and solemn shade. The avowed and ostensible object of the persons who every summer gather into a small knot of fashion in this village, is the very simple and innocent one of "drinking water." The Pananich wells were discovered some sixty years ago, from the circumstance, it has been said, of an old woman having cured herself of sores from dipping herself in the spring; since then, the number of visitors has increased yearly; coaches are driven betwixt the village and Aberdeen, and a communication has been opened through Glenshee to Edinburgh.

The wells of Pananich, which are about a mile from Ballater, peep prettily over the trees on the high bank on the opposite side of the river, looking down upon the stream; the establishment consists of a bathing-house and pump-room; and there is a sort of small hospital, very little inhabited by the class of persons in the habit of frequenting Ballater. There are here two descriptions of water: that of one of the springs has the credit of curing scrofulous complaints; that of the other of being of a diuretic quality, and affording relief in cases of gravel, &c. The water in many places springs from the sides of the bank; and it is quite gratifying, in a hot summer day, to see a band of sturdy idlers lolling round these springs, and drinking deep for relief to their numerous disorders. We remember once approaching one of these parties, who appeared extremely boisterous and jovial over deep draughts of the water; we made some remarks on the peculiar virtues of the chalybeate, and on its astonishing effects on the herculean figures before us, when one of the sturdiest of the party, lifting a queich to his lips, remarked, with a peculiar turn of his eye, "Och ay, sir; it's to huz that it does gueede; it's no to nane but them that taks a good curn o' whusky in't that it does gueede." We have always held in mind the advice so solemnly delivered, when we made any application to the waters of the Pananich wells. But having now brought the reader to this spot, he may very probably ask what he is to do with himself for a week or two. In the first place, as to stowing himself away, there is a capital newly built inn, where there is a daily ordinary, and where he will find himself as comfortable as in a city hotel; and the place is filled with lodging-houses. Then, as to the matter of amusement, if he is not content with perambulating and looking at the scenery, we hardly know what to do with him. For our own part, we can scarcely describe the mere indolent pleasure we have felt, after some months of labour and annoyance in the crowded dusty city, in seating ourselves down, in a hot summer afternoon, on a tuft of fresh heather, the shadow of Craigendarch, with its beautiful birches and small oak trees, over our heads; the small plain studded with a few houses, and the winding Dee, at our feet; with the beautiful outlines of the hills gilded with the sun, and the enormous precipices of Lochin-ye-gar stripped of their terrors, sleeping calmly against the unclouded sky, and looking like a soft object outlined and coloured on the blue ground. Perhaps there is a slight hum of children amusing themselves, and now and then a citizen, freed from his eleven months' toil, crosses your path. These, and the houses, and the curling smoke, and a few cultivated fields, are the pleasing signs that you are in the inhabited world, but otherwise you are alone with nature.

The chief amusement of Ballater is in circumambulation. You can hardly walk a few hundred yards without seeing something curious, and the natural grandeur which surrounds the place has been lately added to, while the beauty has been somewhat subtracted from by the devastations of the floods; but there are some peculiar scenes which may admit the term "lions" being applicable. There is first Lochin-ye-gar, which we have already tried to describe. Then there is the Lin of Muich, a thundering waterfall of some fifty feet or so. Then there is the whole of Glenmuic, a very wild glen; and Lochmuic, a lake deeply seated among the mountains, about two and a half miles in length, and one in breadth. Then, a little higher in the mountains, is the smaller lake called Dhu Loch—a cold-looking sheet of water, deeply seated among precipices, and visited by the eagle. As a contrast, take Loch Kinord, a calm sedgy lake, in a deep peaceful hollow among the hills, with a small island in the middle, presumed to be artificial, on which are some ruins, given by *tradition* as the habitation of Malcolm Canmore. Not far from this is the great hill of Morven, at the foot of which rambles a stream characteristically termed the Burn of the Vat. In one spot, the burn enters on the premises of a large rock, which time has enabled the water to hollow out in such a manner, that the spectator, entering a narrow crevice through which the stream passes, feels himself within a great well or vat, with high smooth circular stone sides, from which spring a few birch trees, looking, from their height and stuntedness, like greenhouse plants. Then, if you are fond of such things, you may look at the house of Ballatrich, where Byron lived when he

> ——"roved, a young Highlander, o'er the dark heath,
> And climb'd the steep summit, to Morven, of snow,
> To gaze on the torrent that thunder'd beneath,
> Or the mist of the tempest that gathered below."

Not far from this you may see Colbleen, of which the same poet has said,

> "When I see some dark hill point its crest to the sky,
> I think of the rocks that o'ershadow Culbleen."

This is a singular line of mountain, of which the stone seems to have a constant propensity to force its way through the mould and heather.

LISTENERS.

Golden opinions are often to be gained by discreet silence. Some people delight exceedingly to hear themselves talk, but above all things are captivated with the respectful attention of a steady listener; and whoever has the patience to sit and hear them out (that is, not absolutely to wait until they stop of their own accord—for perhaps there is no well-authenticated instance of any thing of that kind—but till something occurs to interrupt them), obtains their good will far more certainly than if he had communicated to them a vast variety of important information, or taken a world of pains to correct their mistaken notions. A character for the most engaging modesty falls inevitably to the lot of him who possesses the power of holding his tongue; the praises of his discernment are every where sounded; nay, he often acquires a reputation for conversational abilities: it is true, with regard to this latter point, that doubts are sometimes expressed by some who have been whole nights in his company without hearing him utter more than a few syllables; but the interminable talker—the never-failing patron of silent gentlemen—forgetful of his own fame in his zeal for that of his client, declares that good talents for conversation do not consist in the multiplication of sentences, but in speaking succinctly to the purpose. Advantages more substantial than favourable regards do also frequently accrue to the possessor of this qualification: it were endless to recount how many large fortunes have been secured by persons, male and female, in the fifth, sixth, and seventh degrees of kin, who day after day for years had the fortitude to submit their ears to the recital of the same stories and remarks from an old invalid bachelor relation. And far be it from us to maintain that in this respect the effect did not most naturally and most justly follow the cause. People who have become rich in this manner enjoy indeed no high repute with the world; they are commonly reproached with having meanly subjected their minds for a number of years to a servile acquiescence with all the caprices of him whom they courted through no attachment to his person, but with the precarious expectation of coaxing from him a munificent legacy. This no doubt is more or less the case. We believe, however, that when two persons live long together, their intercourse for the most part assumes a kindlier character than that between a haughty lord and an obsequious dependent. The wants to which we daily administer beget in us pity for him who needs assistance—satisfaction with ourselves in being able to relieve them—and a degree of affection for the individual who thus engrosses so much of our care. Gratitude in the other party for dutiful services and increased comforts is a still stronger and more obvious bond of union. This is true, whether the services performed have regard to the case of a decayed body, or the amusement of a mind that cannot find employment within itself. If single gentlemen who have made quarter-plums, half-plums, and plums, without cultivating elegant tastes, the exercise of which might relieve the weariness of an unoccupied old age, were to retire from the bustle of action or business, and to find nobody upon whom to bestow their garrulity, their days would be dreary and wretched in the extreme. Whoever, therefore, lightens the tedium of their afternoons confers upon them whatever happiness they enjoy, and they cannot extend their liberality to any one who better deserves it.

Valuable listeners are seldom to be found of an advanced age. When people get established in life, and have amassed a share of substance and experience, they begin to feel their own weight—to think their opinions merit consideration as well as those of others, and that they are entitled to "deliver their sentiments at length on the subject." As their wealth and wisdom are farther increased, what they say assumes the tone of incontrovertible maxims rather than that of persuasion or argument. By and bye they cannot bear to be contradicted, and in a little time longer you will hear it whispered that they have become intolerable prosers. This gradation is not in every instance true to the letter: multitudes of veterans retain the candour, the simplicity, and almost the vivacity of youth, to their latest years. But somehow or other a man of that period of life is never pitched upon as a person proper to receive the full details of a very long story, which in general cannot be heard with a zest of attention and admiration sufficient to gratify the narrator, unless by the inexperience of the young, which "holds each strange tale devoutly true."

Yet there is a method by means of which talkers frequently contrive to enlist auditors of any age: you have a piece of urgent business, and, going to the person with whom it is to be transacted, lay the whole affair before him: it may be of equal importance to him, but perceiving of what consequence it is to you, and being a proser, he answers, "Well, well; we'll talk of that presently: but did you hear of our famous dinner last night?" You in vain endeavour to get off by saying that you read a full account of the proceedings in the newspapers this morning; he protests there never was such a negligent or partial set as the reporters—they have omitted or misrepresented the whole of his speech: and he goes on mercilessly to inflict upon you the entire oration, from the—"Gentlemen, unacquainted as I am with public speaking," down to the resolution which he in vain attempted to persuade the "numerous and respectable company" to adopt; concluding with a supplementary address to yourself, to prove the ruinous consequences that must inevitably ensue from the rejection of his proposal. Having fully disburdened his mind upon you, notwithstanding your looks of agony, and the unsettled manner in which you occupy your chair, he then perhaps recurs to the matter in dependence between you and him, and you obtain a satisfactory arrangement, which would certainly have been postponed if you had been altogether refractory, and declined to hear the mighty matter with which his mind was labouring. I remember hearing the advice of a wine-merchant, in very extensive business, to his son, which is very much to the present purpose. It is very well known that many of the transactions of wholesale merchants with their country customers are managed by "travellers," as they call themselves, or "bagmen," as they are derisively termed by those whose wit is not too refined to prevent them from making a joke of a man's profession. The sons of the merchants themselves are often employed in this manner, not only to give them a knowledge of every part of their profession, but to introduce them to a personal acquaintance with those who deal with "the house." From a journey of this kind the young man alluded to had just returned; and his father asked him, among other things, "Well, Tom, and how much are we to send to my friend the Provost of Sybo?" "He did not favour me with an order," replied Tom, evidently a little chagrined to confess his want of success in that quarter. "Did not favour you with an order!" exclaimed his father. "There must have been some very particular reason for that." "Why," was the answer, "when I told him our vintages, he would talk of nothing but provincial politics. The conduct of Deacon Farlane at the last election, he assured me, was perfectly infamous. I begged him to look over the catalogue, and select such supplies as he required. He begged to refer it to me if it was not a most base thing in a man first to pledge himself to one party, and then to vote for the other; and went on to enumerate a host of his fellow-citizens who had been guilty of

that delinquency. Perceiving there was no end to his vehemence, I informed him civilly, that, as I had a number of other calls to make, it would be obliging if he would honour me with any orders he had to give. 'Very well, young man,' he said, 'nothing is wanted at present; but give my respects to my old friend your father, who did not use to speak of making other calls the first night he came to my house.' And so," concluded Tom, "I took my leave." "Tom, Tom!" said his father, on hearing this explanation, "I don't know what you'll make of the business when it comes into your hands; but if you wish to sell wine with success, you must be content to listen to a great deal that people have to say on other subjects; and if you do so respectfully, ten to one but they will take a larger quantity than they at first intended. It will not do to go about, and cry, 'Wine, wine!—how much shall we send you?' I must set out to Sybo to-morrow, and keep the worthy Provost a customer of the house, as long at least as I am a partner in it."

BIOGRAPHIC SKETCHES.

JAMES LACKINGTON.

My young friends, the Boys, may remember, that, in my leading address in the first number of the Journal, I promised to give them interesting stories of men who were at one time poor little boys like themselves, but who, by being always honest and industrious, as well as ambitious of rising in the world, came at last to have fine houses and parks, and to be distinguished above all ordinary persons. I am now therefore going to give the boys one of these instructive biographies, namely, the life of James Lackington, a famous London bookseller, who began the world with no more than a single halfpenny, and yet, by his extraordinary perseverance and integrity, became one of the most opulent and respected men of his time. The memoir is in the words of the author himself, except where abridgement is necessary.

"I was born at Wellington, in Somersetshire, on the 31st of August 1746. My father, George Lackington, was a journeyman shoemaker, and a person of such dissipated habits, that the whole charge of rearing his family fell upon my mother, a woman of extraordinary industry, and one who had a very hard fate in being allied to a husband who spent upon liquor all that he could earn. Never did I know or hear of a woman who worked and lived so hard as she did to support eleven children; and were I to relate the particulars, they would not gain credit. I shall only observe, that, for many years together, she worked nineteen or twenty hours out of every twenty-four. Out of love to her family, she totally abstained from every kind of liquor, water excepted. Her food was chiefly broth, which was little better than water and oatmeal, and her children did not fare much better. When I reflect on the astonishing hardships and sufferings of so worthy a woman, and her helpless infants, I cannot but denounce, in the strongest possible terms, that abominable love of drinking, by which my father, as is too often the case, neglected his family, and brought upon himself premature death.

Before my father had fallen into these disgraceful and expensive habits, I was put for two or three years to a day-school, kept by an old woman, who taught me to read the New Testament; but my career of learning was soon at an end, when my mother became so poor that she could not afford the sum of twopence per week for my schooling. Besides, I was obliged to supply the place of a nurse to several of my brothers and sisters; the consequence of which was, that what little I had learned was presently forgot. Instead of learning to read, &c., it very early became my chief delight to excel in all kinds of boyish mischief, and I soon arrived to be the captain and leader of all the boys in the neighbourhood. From this profitless course of life I was rescued at fourteen years of age, when a Mr Bowden, a respectable shoemaker at Taunton, seven miles from Wellington, having seen and taken a liking to me, proposed taking me as an apprentice, offering, at the same time, to seek no premium, and find me in every thing. This offer being accepted by my father, I was immediately bound for seven years to Mr George and Mrs Mary Bowden, as honest and worthy a couple as ever carried on a trade. They carefully attended to their shop six days in the week, and on the Sunday went with their family to a place of public worship.

I had been an apprentice about twelve or fifteen months, when, having been led to attend the prelections of a Methodist preacher, a religious fervour overspread my mind, and engrossed all my faculties. The desire I now had of talking about religious mysteries answered a valuable purpose—it caused me to embrace every opportunity to learn to read, so that I could soon read the easy parts of the Bible, and every leisure minute was so employed. In the winter I was obliged to attend my work from six in the morning till ten at night. In the summer half year I only worked as long as we could see without candle; but, notwithstanding the close attention I was obliged to pay to my trade, yet for a long time I read ten chapters in the Bible every day. I also learned and read many hymns. I had such good eyes, that I often read by the light of the moon, for my master would never permit me to take a candle into the room.

In the fourth year of my apprenticeship, my master died, but as I had been bound to my mistress as well as my master, I was, of course, an apprentice still; but after my master's death I obtained more liberty of conscience, so that I not only went to hear the Methodist sermons, but was admitted into their society, and I believe they never had a more devout enthusiastical member. For several years I regularly attended every sermon, and all their private meetings; but, alas! my good feelings at length suffered interruption. The election for two members of parliament was strongly contested at Taunton just as I attained my twenty-first year; and being now of age, the six or seven months which I had to serve of my apprenticeship were purchased of my mistress by some friends of two of the contending candidates, so that I was at once set free in the midst of a scene of riot and dissipation. Here I had nearly sunk for ever into meanness, obscurity, and vice; for, when the election was over, I had no longer open houses to eat and drink in at free cost; and having refused bribes, I was nearly out of cash. I began the world with an unsuspecting heart, and was tricked out of about three pounds (every shilling I was possessed of), and part of my clothes, by some country sharpers. Having one coat and two waistcoats left, I lent my best waistcoat to an acquaintance, who left the town and forgot to return it."

Lackington seems now to have fallen into profligate habits, which he afterwards looked back upon with deep regret. However, he continued to work hard, at Bristol and other places, as a journeyman shoemaker, and spent a good deal of spare money on all kinds of books, particularly works of poetry, for which he imbibed a strong attachment. After describing the course of life he led for some time, he thus proceeds:—

"I had not long resided a second time with my good Bristol friends, before I renewed my correspondence with an amiable young woman whom I had formerly known, named Nancy Smith. I informed her that my attachment to books, together with travelling from place to place, and also my total disregard for money, had prevented me from saving any; and that while I remained in a single unsettled state, I was never likely to accumulate it. I also pressed her very much to come to Bristol to be married, which she soon complied with; and married we were, at St Peter's Church, towards the end of the year 1770, near seven years after my first declaring my attachment to her.

We kept our wedding at the house of my friends, the Messrs Jones's, and retired to ready-furnished lodgings, which we had before provided, at half a crown per week. Our finances were but just sufficient to pay the expenses of the day; for the next morning, in searching our pockets (which we did not do in a careless manner), we discovered that we had but one halfpenny to begin the world with. It is true, we had laid in eatables sufficient for a day or two, in which time we knew we could by our work procure more, which we very cheerfully set about, singing together the following lines of Dr Cotton:—

'Our portion is not large indeed,
But then how little do we need,
For Nature's calls are few;
In this the art of living lies:
To want no more than may suffice,
And make that little do.'

After having worked on stuff-work in the country, I could not bear the idea of returning to the leather branch, so that I attempted and obtained a seat of stuff in Bristol; but better work being required there than in country places, I was obliged to take so much care to please my master, that at first I could not get more than nine shillings a-week, and my wife could get but very little, as she was learning to bind stuff shoes, and had never been much used to her needle; so that, what with the expense of ready-furnished lodgings, fire, candles, &c., we had but little left for purchasing provisions. Having, besides, to pay off a debt of near forty shillings, it took two months to make up that sum, during nearly the whole of which time it was extremely severe weather; and yet we made four shillings and sixpence per week pay for the whole of what we consumed in eating and drinking. Strong beer we had none, nor any other liquor (the pure element excepted); and instead of tea, or rather coffee, we toasted a piece of bread; at other times we fried some wheat, which, when boiled in water, made a tolerable substitute for coffee; and as to animal food, we made use of but little, and that little we boiled and made broth of. But we were quite contented, and never wished for any thing that we had not got.

Unfortunately, our health failed under these circumstances, and we were both together taken so ill as to be confined to our bed; but the good woman of the house, our landlady, came to our room and did a few trifles for us. We had in cash two shillings and ninepence, half a crown of which we had carefully locked up in a box, to be saved as a resource on any extraordinary emergency. This money supported us two or three days, in which time I recovered, without the help of medicine; but my wife continued ill nearly six months, and was confined to her bed the greatest part of the time. It is impossible for words to describe the keenness of my sensations during this long term; yet, as to myself, my poverty, and being obliged to live upon water-gruel, gave me not the least uneasiness—it was the necessity of being continually in the sight and hearing of a beloved object, a young and innocent wife, who lay in a state of acute suffering.

Thinking that nothing could relieve my wife but change of air to her native place, I removed from Bristol to Taunton; but here I could not procure so much work as I could do, and, with a view of having a better price for my work, I resolved to visit London; and as I had not money sufficient to bear the expenses of both to town, I left her all the money I could spare, and took a place on the outside of the stage-coach, and the second day arrived at the metropolis, in August 1773, with two shillings and sixpence in my pocket. Next morning I procured a lodging in Whitecross Street, at the house of an acquaintance, and Mr Heath, in Fore Street, supplied me with plenty of work.

In a month I saved money sufficient to bring up my wife, and she had a tolerable state of health: of my master I obtained some stuff shoes for her to bind, and nearly as much as she could do. Having now plenty of work and higher wages, we were tolerably easy in our circumstances, more so than ever we had been, so that we soon procured a few clothes. My wife had all her life before done very well with a cloth cloak, but now I prevailed on her to have one of silk: until this winter, also, I had never found out that I wanted a greatcoat, but now I made that important discovery. At this time we were so lucky as to receive a small legacy of ten pounds, left by one of my wife's relations, and this assisted us to purchase some household goods; but as we had not sufficient to furnish a room, we worked hard, and lived still harder, so that in a short time we had a room furnished with articles of our own. It would not be possible for any one to imagine with what pleasure and satisfaction we looked round the room and surveyed our property. I believe that Alexander the Great never reflected on his immense acquisitions with half the heartfelt enjoyment which we experienced on this capital attainment. After our room was furnished, as we still enjoyed a better state of health than we did at Bristol and Taunton, and had also more work and higher wages, we often added something or other to our stock of wearing apparel. Nor did I forget the old bookshops, but frequently added an old book to my small collection; and I really have often purchased books with the money that should have been expended in purchasing something to eat. On one occasion, when presented with half a crown to buy a joint for our Christmas dinner, I could not resist the temptation of purchasing a copy of Young's Night Thoughts with the money, and my wife thought, on reflection, that I had acted wisely, for had I bought a dinner, we should have eaten it to-morrow, and the pleasure would have been soon over; but should we live fifty years longer, we had the Night Thoughts to feast upon.

Some time in June 1774, as we sat at work in our room, a friend called and informed me that a little shop and parlour were to be let in Featherstone Street, adding, that if I was to take it, I might there get some work as a master. I without hesitation told him that I liked the idea, and hinted that I would sell books also. He then asked me how I came to think of selling books? I informed him that until that moment it had never once entered into my thoughts, but that, when he proposed my taking the shop, it instantaneously occurred to my mind, that for several months past I had observed a great increase in a certain old bookshop, and that I was persuaded I knew as much of old books as the person who kept it. I farther observed, that I loved books, and that if I could but be a bookseller, I should then have plenty of books to read, which was the greatest motive I could conceive to induce me to make the attempt. My friend on this assured me, that he would get the shop for me, which he did, and, to set me up in style, recommended me to the friends of a person recently deceased, and of whom I purchased a bagful of old books, chiefly divinity, for a guinea.

With this stock, and some odd scraps of leather, which, together with all my books, were worth about five pounds, I opened shop on Midsummer-day 1774, in Featherstone Street, in the parish of St Luke, and nothing could exceed the pleasure I felt in surveying my little shop with my name over it. At that time Mr Wesley's people had a sum of money which was kept on purpose to lend out, for three months, without interest, to such of their society whose characters were good, and who wanted a temporary relief. To increase my little stock, I borrowed five pounds out of this fund, which was of great service to me. In our new situation we lived in a very frugal manner, often dining on potatoes, and quenching our thirst with water; being absolutely determined, if possible, to make some provision for such dismal times as sickness, shortness of work, &c., which we had been frequently involved in before, and could scarcely help expecting not to be our fate again.

I lived in this street six months, and in that time increased my stock from five pounds to twenty-five pounds. This immense stock I deemed too valuable to be buried in Featherstone Street, and a shop and parlour being to let in Chiswell Street, No. 46, I took them. This was at that time, and for fourteen years afterwards, a very dull and obscure situation, as few ever passed through it besides Spitalfields weavers on hanging days [proceeding towards Tyburn]; but still it was much better adapted for business than Featherstone Street. A few weeks after I came into this street, I bade a final adieu to the gentle craft, and converted my little stock of leather and tools into books. My business now increased considerably,

many persons buying books from me under the idea of purchasing cheaper than they could at respectable shops; but a considerable number of these kind of customers, which I had in the beginning, forsook my shop as soon as I began to appear respectable, and keep things in better order. I went on prosperously until some time in September 1775, when I was suddenly taken ill of a dreadful fever; and eight or ten days after, my wife was seized with the same disorder. I was a considerable time ill, but at length recovered; my wife, however, sunk under the disease, and her loss involved me in the deepest distress.

During the illness of my wife and myself, we were gratuitously and kindly attended by a young lady in the neighbourhood, who, by the misfortunes of her father, had been reduced to keep a school, and work very hard at plain work, by which means she kept her father from want. Now, this old gentleman died shortly afterwards; and being acquainted with his daughter's goodness, I concluded that so amiable a daughter was very likely to make a good wife. I also knew that she was immoderately fond of books, and would frequently read until morning, which turn of mind in her was the greatest of all recommendations to me. I embraced the first opportunity, therefore, to make her acquainted with my mind, and being no strangers to each other, there was no need of a formal courtship; so I prevailed on her to be my wife, and we were married on the 30th of January 1776."

Some time previously, Lackington abandoned the Methodist connection. From the period of his second marriage, success attended him in all his business arrangements, as a dealer in old books; and he mentions, that nothing did him so much good as the practice of selling only for ready money. He also adopted the plan of publishing catalogues of his books: the first catalogue, he says, contained twelve thousand volumes, and the second, put forth in 1784, thirty thousand volumes. From buying small quantities of books, he rose to be able to purchase whole libraries, reversions of editions, and to contract with authors for manuscripts of works. This extensive and lucrative business now enabled him to live in a very superior style. "I discovered," says he, "that lodgings in the country were very healthy. The year after, my country lodging was transformed into a country house, and, in another year, the inconveniences attending a stage-coach were remedied by a chariot." As usual in such cases, the envy of the world pursued Lackington for his supposed extravagance; but it appears he was strictly honourable in trade, and spent only what was his own. He assures his readers that he found the whole of what he was possessed of in "*small profits*, bound by *industry*, and clasped by *economy*." In 1792, the profits of his business amounted to L.5000.

The success of Lackington enabled him, in 1798, to retire from the bookselling business with a competent fortune, the reward of his own ingenuity, industry, and tact, in the way of reprinting books at a cheap rate, leaving Mr George Lackington, a third cousin, at the head of the firm, which still exists in the neighbourhood of Finsbury Square. Lackington at first took up his residence in Gloucestershire. Subsequently, he purchased two estates in Alvestone, on one of which was a genteel house, in which he made various improvements, and took up his abode, keeping a carriage, and living in great style. In his retirement, he again joined himself to the Methodists, for whom he built and endowed different chapels, and, till the last, expressed his great sorrow for the manner in which he had spoken of that body in his published memoirs. He finally retired to Budleigh Sulterton, in Devonshire; but soon after, his health declined, and he became subject to epileptic fits. At length his decease took place on the 22d of November 1815, in the 70th year of his age.

SLIDE OF ALPNACH.

[From the Economy of Machinery and Manufactures, by Charles Babbage.]

Amongst the forests which flank many of the lofty mountains of Switzerland, some of the finest timber is found in positions almost inaccessible. The expense of roads, even if it were possible to make them in such situations, would prevent the inhabitants from deriving any advantages from these almost inexhaustible supplies. Placed by nature at a considerable elevation above the spot on which they are required, they are precisely in fit circumstances for the application of machinery; and the inhabitants constantly avail themselves of it, to enable the force of gravity to relieve them from some portion of their labour. The inclined planes which they have established in various forests, by which the timber has been sent down to the water-courses, must have excited the admiration of every traveller; and these slides, in addition to the merit of simplicity, have that of economy, as their construction requires scarcely any thing beyond the material which grows upon the spot. Of all these specimens of carpentry, the Slide of Alpnach was by far the most considerable, both from its great length, and from the almost inaccessible position from which it descended. The following is the description of that work given in Gilbert's Annalen, 1819, and translated in the second volume of Brewster's Journal:—

"For many centuries, the rugged flanks and the deep gorges of Mount Pilatus were covered with impenetrable forests. Lofty precipices encircled them on all sides. Even the daring hunters were scarcely able to reach them; and the inhabitants of the valley had never conceived the idea of disturbing them with the axe. These immense forests were therefore permitted to grow and to perish, without being of the least utility to man, till a foreigner, conducted into their wild recesses in the pursuit of the chamois, was struck with wonder at the sight, and directed the attention of several Swiss gentlemen to the extent and superiority of the timber. The most intelligent and skilful individuals, however, considered it quite impracticable to avail themselves of such inaccessible stores. It was not till November 1816, that M. Rupp, and three Swiss gentlemen, entertaining more sanguine hopes, drew up a plan of a slide, founded on trigonometrical measurements. Having purchased a certain extent of the forests from the commune of Alpnach for 6000 crowns, they began the construction of the slide, and completed it in the spring of 1818.

The Slide of Alpnach is formed entirely of about 25,000 large pine trees, deprived of their bark, and united together in a very ingenious manner, without the aid of iron. It occupied about 160 workmen during eighteen months, and cost nearly 100,000 francs, or L.4250. It is about three leagues, or 44,000 English feet long, and terminates in the Lake of Lucerne. It has the form of a trough, about six feet broad, and from three to six feet deep. Its bottom is formed of three trees, the middle one of which has a groove cut out in the direction of its length, for receiving small rills of water, which are conducted into it from various places, for the purpose of diminishing the friction. The whole of the slide is sustained by about 2000 supports; and in many places it is attached, in a very ingenious manner, to the rugged precipices of granite.

The direction of the slide is sometimes straight, and sometimes zig-zag, with an inclination of from 10° to 18°. It is often carried along the sides of hills and the flanks of precipitous rocks, and sometimes passes over their summits. Occasionally it goes under ground, and at other times it is conducted over the deep gorges by scaffoldings 120 feet in height.

The boldness which characterises this work, the sagacity displayed in all its arrangements, and the skill of the engineer, have excited the wonder of every person who has seen it. Before any step could be taken in its erection, it was necessary to cut several thousand trees, to obtain a passage through the impenetrable thickets; and, as the workmen advanced, men were posted at certain distances, in order to point out the road for their return, and to discover, in the gorges, the places where the piles of wood had been established. M. Rupp was himself obliged, more than once, to be suspended by cords, in order to descend precipices many hundred feet high; and, in the first months of the undertaking, he was attacked with a violent fever, which deprived him of the power of superintending his workmen. Nothing, however, could diminish his invincible perseverance. He was carried every day to the mountain in a barrow, to direct the labours of the workmen, which was absolutely necessary, as he had scarcely two good carpenters among them all; the rest having been hired by accident, without any of the knowledge which such an undertaking required. M. Rupp had also to contend against the prejudices of the peasantry. He was supposed to have communion with the devil. He was charged with heresy, and every obstacle was thrown in the way of an enterprise, which they regarded as absurd and impracticable. All these difficulties, however, were surmounted, and he had at last the satisfaction of observing the trees descend from the mountain with the rapidity of lightning. The larger pines, which were about a hundred feet long, and ten inches thick at their smaller extremity, ran through the space of *three leagues*, or nearly *nine miles, in two minutes and a half*, and during their descent, they appeared to be only a few feet in length. The arrangements for this part of the operation were extremely simple. From the lower end of the slide to the upper end, where the trees were introduced, workmen were posted at regular distances, and as soon as every thing was ready, the workman at the lower end of the slide cried out to the one above him, '*Lachez*' (let go). The cry was repeated from one to another, and reached the top of the slide in *three* minutes. The workmen at the top of the slide then cried out to the one below him, '*Il vient*' (it comes), and the tree was instantly launched down the slide, preceded by the cry which was repeated from post to post. As soon as the tree had reached the bottom, and plunged into the lake, the cry of *Lachez* was repeated as before, and a new tree was launched in a similar manner. By these means a tree descended every five or six minutes, provided no accident happened to the slide, which sometimes took place, but which was instantly repaired when it did.

In order to show the enormous force which the trees acquired from the great velocity of their descent, M. Rupp made arrangements for causing some of the trees to spring from the slide. They penetrated by their thickest extremities no less than from eighteen to twenty-four feet into the earth; and one of the trees having by accident struck against the other, it instantly cleft it through its whole length, as if it had been struck by lightning.

After the trees had descended the slide, they were collected into rafts upon the lake, and conducted to Lucerne. From thence they descended the Reuss, then the Aar to near Brugg, afterwards to Waldshut by the Rhine, then to Basle, and even to the sea when it was necessary.

In order that none of the small wood might be lost, M. Rupp established in the forest large manufactories of charcoal. He erected magazines for preserving it when manufactured, and had made arrangements for the construction of barrels, for the purpose of carrying it to the market. In winter, when the slide was covered with snow, the barrels were made to descend on a kind of sledge. The wood which was not fit for being carbonized, was heaped up and burnt, and the ashes packed up and carried away, during the winter.

A few days before the author of the preceding account visited the slide, an inspector of the navy had come for the purpose of examining the quality of the timber. He declared that he had never seen any timber that was so strong, so fine, and of such a size; and he concluded an advantageous bargain for 1000 trees.

Such is a brief account of a work undertaken and executed by a single individual, and which has excited a very high degree of interest in every part of Europe. We regret to add, that this magnificent structure no longer exists, and that scarcely a trace of it is to be seen upon the flanks of Mount Pilatus. Political circumstances having taken away the principal source of the demand for timber, and no other market having been found, the operation of cutting and transporting the trees necessarily ceased."

Professor Playfair, who visited this singular slide, states, that six minutes was the usual time occupied in the descent of a tree, but that in wet weather it reached the lake in three minutes.

Column for Schoolboys.

HORACE—CICERO.

Among the Latin poets, Horace, or more properly Quintus Horatius Flaccus, although accounted the most difficult, has been without doubt always the most popular; and accordingly we find more frequent quotations from him than from any other. "He is in Latin," says Dr Francis, "what Pope is in English; and the reason is honourable to his talents, to the refinement and elegance of his sentiments, and to the universal range he took through the extensive provinces of manners, morals, and criticism."

Quintus Horatius Flaccus was born at Venusia, a city on the confines of Apulia, in the south of Italy, on the 8th of December, in the year 64 before Christ. His father was a freedman, and the son of a slave. His principal occupation seems to have been that of a tax-gatherer, and it is said also that he was a fishmonger. Notwithstanding that his income, derived from a small farm in that unproductive part of the country, must have been but scanty, and his other occupations mean and unpopular, it appears that he found means to send his son in early life to Rome, where he obtained a liberal education and an extensive knowledge of mankind, many proofs of which occur in his poetical compositions. On completing his course of education at Rome, Horace went to finish his studies at Athens, which possessed almost the only schools of philosophy at that time in the world. At Athens he contracted acquaintance with many of the young Roman nobility, and became particularly intimate with Brutus, the celebrated republican leader, who appointed him a tribune in his army, an office corresponding nearly to that of colonel. He was at this time twenty-three years of age, and without the least experience in military affairs, as was shown immediately at the battle of Philippi, where, like the great Demosthenes before him, he allowed unmanly terror and shameful flight to deprive him for ever of the reputation of heroism. These circumstances the poet himself has not endeavoured to conceal. Any property which he possessed was at this time lost by confiscation, and necessity then compelled him to exercise his talents for poetry. The excellence of his first attempts gained him the friendship of Virgil, and of Varius, another great poet of those times, but whose works have unfortunately all perished. By these two friends he was introduced to Mæcenas, one of the most celebrated patrons of learned men that ever lived, by whose liberality he was not only relieved from the distresses of poverty, but also enriched even beyond what he formerly possessed. From this period he lived in affluence, enjoying the society of the learned and the patronage of the great. Augustus honoured him with his friendship; and it appears that learned men then lived easy and familiarly with the great, since it is mentioned that the emperor would sometimes seat himself betwixt Virgil and Horace, and say, jestingly, that he sate betwixt sighing and tears—alluding to the asthma of the one, and the rheumatic eyes of the other. Our poet formed one of the party who went from Rome to negociate a peace between Augustus and Marc Antony, at Brundusium, of which journey he has given a very humorous account in the fifth satire of his first book.

Horace was bound by the strongest ties of gratitude, both to Augustus and his ministers, and therefore impartiality cannot blame the poet for the manner in which he has spoken of Augustus in preference to his rival, Marc Antony. To defend him against the charge of extreme flattery towards the emperor, would perhaps be a fruitless attempt; yet much might be said in extenuation. Flattery is found generally to

keep pace with liberality; and men of genius seldom show a want of adulation when favours have either been received or are expected from the rich or noble. A stronger objection, and one which admits of no palliation, may be brought against several passages in the writings of the Venusian bard. It is grieving to meet with effusions of imagination, conveyed in the grossest language, amidst the finest turns of thought, delicacy of feeling, justness of sentiment, and unrivalled felicity of expression. The moral truths which Horace has mixed with high poetic sentiment and description, would almost form a system of ethics; but these very truths are debased by vicious intermixture. These passages, however, although considerable in number, form but a small proportion of his works, and it would be difficult to name a lyric poet who could with advantage be set in opposition to Horace.*

It would be difficult to add to the praises which every judge of Latin poetry has bestowed on the writings of Horace. There is an indescribable charm in them which gives fresh pleasure to the classical scholar at every new perusal. This is the indubitable test of genuine poetry, and is, perhaps, nowhere found in higher perfection than in the enchanting pages of Horace. According to his own account, his personal appearance had not been any thing of the most prepossessing, particularly from his being afflicted so much with sore eyes; and the cheerfulness of his disposition seems to have deserved greater commendation than the mildness of his temper. He is understood to have been an epicurean in his philosophical sentiments; and, with the love of ease and tranquillity for which he was noted, he set a very moderate value on riches and splendour. He died in the year 7 before the Christian era, in the 57th year of his age, leaving his property to Augustus, from which some have inferred that he outlived his great patron Mæcenas. He was buried in the neighbourhood of the Esquilian hill at Rome, and not far from the sepulchre of Mæcenas.

The works of Horace consist of his Odes, in five books; the poem on the Secular Games; the Satires, in two books; the Epistles, in two books; and the Art of Poetry. His satires and epistles have had many imitators in modern times, and great genius and considerable success have been displayed in many of their performances. Of all the classical writers, Horace is by general consent allowed to be the most difficult to translate; yet so universal has been the ambition to perform this task, that scarcely an English poet can be named, in whose works we do not find some part of Horace. These efforts, however, have not so frequently been directed to give the sense and local meaning of the author, as to transfuse his satire, and adapt it to modern persons and times. Of the few who have exhibited the whole of this interesting poet in an English dress, Dr Philip Francis is thought to have succeeded best in that which is most difficult, the lyric part, and likewise to have conveyed the spirit and sense of the original, in the epistles and satires, with least injury to the genius of the author.

An edition of the works of Horace, Virgil, and some other of the Latin authors most commonly used in schools, was formed for the use of the dauphin in France, in the time of Louis the Fourteenth. Each author is illustrated with a series of very useful notes, and an easier collocation of the words is given in the margin, with other matters well calculated to assist that prince, and other ingenuous youths, in their study of the Roman writers. The first of these, being the works of the Latin historian Florus, was published at Paris, in 1674, by a lady who calls herself Anna, daughter of Tannaquil Faber; and the others were given afterwards by the dauphin's classical tutor, Daniel Crispin; and these constitute what is called the *Delphine* edition of the classics.

The genius displayed by the historians and poets of Rome, evidently entitle her to stand on a level with Greece, in regard to such literature; and we come now to consider her claims to the palm of Eloquence, where, by the genius of Cicero, we find her placed at once on an equality with her great rival in this respect also.

Marcus Tullius Cicero, the father of Roman eloquence, was born at Arpinum, a small town not far from Rome, on the 2d of January, in the year 106 before Christ. Plutarch alleges that the surname *Cicero* took its rise from the circumstance of one of the family having had a flat excrescence on the nose, resembling a *vetch* (in Latin *cicer*); but Pliny supposes that the name was first given to one remarkable for the culture of *vetches*, a certain kind of pulse.

In early life, Cicero gave proofs of those talents which afterwards procured him the highest offices in the state, and conferred honour on the nation to which he belonged. He appears to have made poetry his chief study in his boyish days, and in that pursuit he displayed a strength of mind, and a precocity of genius, of very rare occurrence. He wrote a poem called Glaucus; translated the works of Arätus, a Greek poet, into Latin verse, at the age of seventeen; sung the praises of Caius Marius; and in the latter years of his life he recorded in verse the history of his own consulship. These formed the whole of his poetical works, but, unfortunately, no portion of them has been transmitted to posterity. He acquired his knowledge of oratory under Philo, the academic philosopher, of law under Mutius Scævöla, and of military affairs under the celebrated leader Sylla. His father, although of equestrian rank, had not obtained any public magisterial dignity, and on that account Cicero frequently calls himself a *new man*, an appellation which his enemies used in reproach. After completing his studies, being disgusted with the tendency of the civil wars, he retired into private life, spending his time in the pursuit of philosophy, and in conversation with men of learning, chiefly natives of Greece. His defence of Roscius, the famous actor, the greater part of which oration is still extant, procured his first mark of distinction as an orator, and prudence dictated the propriety of his travelling immediately into Greece, under pretence of delicate health, in order to escape the resentment of Sylla, whose indignation was roused by the acquittal of the man whom he had accused. In Greece, Cicero attended the lectures of various celebrated masters; and, at the suggestion of Apollonius of Rhodes, he declaimed publicly in Greek, and received high approbation from all present, except Apollonius himself, who remained for some time thoughtful and silent. At last, to remove the uneasy feeling of the young orator, which his behaviour had excited, he said to him, "Cicero, I cannot but admire and praise you, only I am concerned for the fate of Greece. She had nothing left her but the glory of eloquence, and you are carrying that likewise to Rome."

On returning home, Cicero applied himself to public affairs, and his eloquence soon raised him above all the Roman orators. He exercised the office of quæstor in Sicily, with great reputation; after which he held successively the dignities of edile, prætor, and consul, at the regular times when he was fitted by age for these offices. His society consisted chiefly of literary men, and he lived in a genteel but frugal manner. To a frame naturally slender, weakness of stomach added other disadvantages, which he overcame by regularity in study and exercise, and by moderation in eating and drinking. His house stood on Mount Palatine, and he held a levee every day, which the most distinguished men in Rome attended, amongst whom was Pompey the Great. His integrity in the administration of justice during his prætorship was rewarded by the approbation of his fellow-citizens, who united in raising him to the consulship, to crush the conspiracy of Cataline. The ability with which he formed, and the vigour with which he executed, the measures of administration at that dangerous conjuncture, would have placed him high as a statesman, although no other action of his life had entitled him to distinction. Vanity, the inherent failing of this great man, now appeared in its most offensive form, and excited greater enmity against him than so trivial a weakness should have provoked. Publius Clodius, and others, amongst whom history mentions Julius Cæsar, contrived to excite so much odium against him, on account of the arbitrary manner in which he had put some of Cataline's accomplices to death, that at last they procured his banishment from Italy. He went and settled at Dyrrachium in Macedonia, and the cities of Greece vied with each other in showing civility to the distinguished exile. Here, however, his fortitude deserted him, and his spirits sunk in deep depression. By the exertion of Pompey the Great, and a decree of the senate, that no business should be done until Cicero was recalled, it was soon proposed to the people that they should invite him to return. The citizens in some degree effaced the stigma of their former decision by their unanimity in his recall. The senate decreed their thanks to all the cities which had treated with respect the illustrious exile, and ordered his town and country houses, which Clodius had destroyed, to be rebuilt at the public expense. Such multitudes accompanied him from his landing, that he says, Italy carried him on her shoulders to Rome, an expression which Plutarch considers short of the truth.

Soon after his return from banishment, Cicero undertook the defence of Annius Milo, who had killed Clodius, as is fully set forth in his orations; and on the death of Licinius Crassus, the son of the triumvir, he succeeded to the appointment of augur, and afterwards obtained the government of the province of Cilicia. The justice and moderation which he displayed in the exercise of this important office, gained him the highest approbation from all; and the senate ordered a public thanksgiving for his routing a band of robbers who infested Mount Amanus, for which victory his army saluted him *imperator*, or general-in-chief. On his way home from Cilicia he visited Rhodes and Athens. By the time he reached Rome, the flames of civil war, between Pompey and Cæsar, were ready to burst forth; and he took part with Pompey, as thinking that the public liberty lay on that side; but although he approved of the murder of Cæsar, it does not appear that he took any part in the conspiracy against him.

Hatred of Marc Antony, and the love of glory, now induced Cicero most violently to espouse the cause of Octavius, afterwards Augustus, against Antony, which ended in Octavius most meanly and ungratefully sacrificing the orator to the resentment of the latter. This is one of the many indelible stains in the character of Augustus, which even the excellence of his government, in the latter years of his reign, can neither remove nor lessen.

As soon as Cicero heard of his being proscribed, he and his brother Quintus resolved to take shipping, and join Brutus in Macedonia. After being on board for this purpose, he again landed, and many places of retreat having been suggested, but none fixed upon, his servants, at last, to prevent his being murdered, partly by persuasion, and partly by force, got him into a litter, and were carrying him to the shore, when Herennius, a centurion, and Popilius, a tribune, whom Cicero had defended on a trial for parricide, came up with the litter, on which the orator immediately stretched out his neck, and Herennius severed his head from his body. He likewise cut off both his hands, which, together with the head, Antony caused to be fixed up over the rostrum, or public pleading place at Rome; and the Romans, while gazing on these mangled remains, thought they did not so much see the face and hands of Cicero, as the soul of the dissolute and malignant Antony. "But in vain," exclaims Dr Littleton, "didst thou wreak thy malice, O Antony! upon the author's life, whose immortal writings, to thy perpetual discredit, shall last as long as the world does, which shall always admire his, and curse thy memory." He was cut off in his 63d year, in the 43d before the Christian era.

In regard to the works of Cicero which have come down to us, consisting of his orations, his epistles, and various treatises on important subjects in morals and philosophy, they may be looked upon as comprehending by far the most interesting portion of the Latin language. He is not less to be admired in philosophy than in eloquence, as is testified by his many writings of that kind on several subjects, wherein he has highly approved his great abilities in all sorts of learning, and has made it manifest that the depth and compass of his understanding, together with the solidity of his judgment in his moral and other treatises, equalled the powers and glories of that inimitable style he showed himself master of in his orations. "There is," says Addison, "as much difference in apprehending a thought clothed in Cicero's language, and that of a common author, as in seeing an object by the light of a taper, or by the light of the sun." As in eloquence he made Demosthenes his pattern, so in philosophy he principally followed Plato; for though he shows himself well acquainted with the tenets of the stoics, and the other sects, yet he seems to have adhered chiefly to the opinions of the academics, or sect of Plato. His epistles ought to be read over by the Latin student with great care, as they contain not only the whole history of his private concerns, but of the affairs of state also as they were managed in his time.

Cicero's treatise *De Officiis* is said to have been the first work printed in Europe, after the invention of metal types by John Guttenberg of Mentz, in 1450. A long lost work of this author was brought to light, rather unexpectedly, a few years ago, at Milan, where it had lain for many ages, buried amongst monkish rubbish, in a half obliterated state. It is known that the monks had a custom of obliterating manuscripts, to make room for their own homilies and expositions; and these twice-prepared parchments, or, as they are now technically called, *Palimpsestic MSS.*, have, through means of a fortunate discovery made by the Abbé Mai, librarian at Milan, become a subject of interesting investigation, and the probable source of many important recoveries of lost classic authors. In Rome, the Abbé has already made some valuable discoveries, and recovered the other half of a MS., of which a portion only was found under a work which lay in the Ambrosian library at Milan. Among the works of most importance thus brought to light are a part of Cicero's treatise, *De Republica*, and some commentaries of Frontinus.*

SKETCHES OF POLYNESIA.

Polynesia is a name of Greek derivation, signifying *many islands*, by which geographers distinguish those countries and clusters of islands situated in the Pacific Ocean, and which have been denominated by them the sixth division of the globe—New Holland being now usually considered as the fifth. It would be out of place here to enumerate the various isolated groups, or detail the history of their discovery, as we have at present only to do with two of them—the Georgian and the Society Islands. The first of these were discovered by Captain Wallis, who crossed the Pacific upwards of a century and a half ago; and subsequently by Captain Cook, who affixed the native name of Tahiti to the principal island of the group. Another cluster was afterwards discovered by Cook, about 70 miles to the westward, which he called the Society Islands, in honour of the Royal Society, at whose suggestion the expedition was undertaken. The two clusters extend from 16 to 18 degrees south latitude, and from 149 to 155 degrees west longitude. The Georgian Islands include Tahiti, Eimeo, Tabuamanu or Sir Charles Sanders' Island, Tetuaroa Matea, and Meetia. The Society Islands include Huahine, Raiatea, Tahaa, Borabora, Maurua, Tubai, Monpiha or Lord Home's Island, and Fenuaura or

* Vide Dibdin's "Bibliotheca Classica," an excellent work of first-rate authority, lately published, and to which we are indebted in the drawing up of these articles on Roman literature.

* Lady Morgan's "Italy," vol. i. p. 153.

Scilly Islands, with various other small isles surrounding them. The entire population of these two groups of islands is calculated at the present time to be about 50,000; but it is certain that at one period they must have far exceeded that number. Captain Cook, indeed, estimated the population of Tahiti alone at 200,000. The devastations of disease, infanticide, frequent wars, human sacrifices, and the depopulating influence of vicious habits, have undoubtedly been the causes of this great decrease in the population; and it is not irrationally supposed, even by the islanders themselves, that, but for the humanising and meliorating influence of Christianity upon them, the inhabitants at no distant period would have been totally annihilated. Before presenting a relation of the manner in which these remarkable islanders were reclaimed from barbarism, we shall offer a few sketches of their peculiar customs and primitive condition.

There are two tribes of men of a totally distinct caste in the islands of the South Sea, the one designated oceanic negroes, strongly resembling those of Africa, particularly in the darkness of their skin and the woolliness of their hair. The others are more akin to the European model of frame and physiognomy; and of the latter sort the inhabitants of the Georgian and Society Islands consist. They are generally above the middle size, muscular and well formed, and graceful and unembarrassed in their deportment. Their countenance is open and prepossessing, the forehead generally high and finely formed, and the structure of the other features what by Europeans is generally reckoned handsome. Their complexion is an olive or bronze, their hair black or dark, and neither wiry nor woolly. Specimens, indeed, of all that is reckoned beautiful and symmetrical in the human form and face, may be frequently met with amongst these islanders. There is one remarkable fact in their physiology, that all their rulers and chiefs—all of whom, be it observed, are *hereditary*—are uniformly taller, stronger, and more dignified than the peasantry or common people, insomuch that they have been reckoned a distinct race of men by more than one traveller. The mental capabilities of these islanders are of a much superior cast to almost every other savage nation hitherto known; and, in this respect, together with their hospitable disposition, and docile temper and cheerfulness, present a most favourable specimen of the human being in his primitive and uncultivated state. Their aptness for receiving instruction, indeed, and the facility with which they make themselves acquainted with every art introduced amongst them, together with their naturally acute and logical powers of ratiocination, warrant us in believing, that, although shut out so long from the means of moral enlightenment, they are *originally* behind no nation of the earth as regards intellectual capacity. That they must have existed as a nation for many ages is evident, from the many rude but ingenious rules common amongst them for computing time, measuring distances, calculating numbers, &c. Their native science of notation, indeed, is in principle precisely similar to the Roman system of numerals, that is to say, reckoning from *one* to *ten*, and proceeding upwards by a combination of these numbers, as ten and one, ten and two, &c.

It seems somewhat strange, that, in a people whose unaided native energies had carried them so far on the path towards civilization, their moral habits should have been found so depraved as they were. No portion of the human race, however, were perhaps ever so sunk in that licentiousness which is generally found to distinguish those least removed, in disposition, from the brute creation. The influence of Christianity has of course, amongst its other beneficial consequences, tended to remove this moral blot from their character. In other respects, their private habits were far from being vicious or exceptionable, unless perhaps in a disposition to indolence—a uniform characteristic of the natives of all tropical climes. They are extremely cleanly in their persons, and are particularly fond of bathing, in which they indulge several times every day; and it is something curious that, unlike the natives of other countries, they prefer the fresh water of the mountain streams to the sea, for that purpose. Since the introduction of razors amongst them, almost every one, high or low, shaves regularly once or twice a-week. In taking their food, the South Sea islanders pursue that mode which would seem at first sight to be the one indicated by nature, but which civilized nations have denominated "irregular"—namely, eating when they are hungry, and drinking when they are dry, at whatever time of the day or night the inclination may seize them. They take a much larger quantity of food than Europeans in general, but it is by no means of an equally nutritive quality, consisting principally of fruits and other vegetables common in their kind to almost all tropical countries, and therefore not requiring here particular enumeration.

Their staple article of food, and what may be denominated with them, as the wheaten loaf is with us, "the staff of life," is the breadfruit, of which they are very fond, and which is found to be highly nutritious. Two or three of these breadfruit trees, or *artocarpus*, are generally found round every rustic cottage in the interior, at once the shelter and subsistence of the inhabitant. The tree bears two, or sometimes three crops in the year. The fruit is never eaten raw but is baked in an oven of heated stones, and, after the outer rind is scraped off, is cut into slices and served up. It is of a pure white, but very tasteless.

The principal occupations of the Polynesians are agriculture, fishing, building, clothmaking, and cooking. In the former, their implements are still very primitive and simple. Neither ploughs nor harrows are yet used amongst them, there being no horses or oxen; and they cannot be brought to use the English spades, hoes, and other implements. Their principal tool is something like a large, broad, iron chisel, fixed on the end of a stick, and is found to serve their purpose remarkably well. The vegetables chiefly cultivated are the *uhi*, or yam, the u-ma-ra, or sweet potato, arrow-root, the plantain, and the sugar-cane.

Fishing is a great pursuit amongst the islanders, many of them being fishermen by profession. They are well acquainted with almost all the known modes of fishing—the net, the spear, the hook and line, &c., besides many other ingenious plans not practised elsewhere. In no part of the world, perhaps, are they surpassed as fishermen; and the variety and excellence of their fishing apparatus is astonishing. Their native hooks are made of wood, shell, or bone; the latter being extremely curious, and answering the purpose both of hook and bait. The method of using them somewhat resembles our fly-fishing, and a short description of it may at once be found amusing, and will show the ingenuity of these isolated people. The shank of the hook used in catching dolphins, albicores, and bonitos, is made with a piece of mother-of-pearl shell, five or six inches long, and three quarters of an inch wide, carefully cut and highly polished, so as to resemble the body of a fish. On the concave side a barb is fastened, with a firm bandage of finely-twisted flax. The barb is usually an inch and a half in length, and is of shell or bone. To the lower part of this the end of the line is securely fastened, and being braided along the inner, or concave part of the shell, is again attached to the upper. These pearl-shell hooks are considered much finer than any manufactured in Europe. The line is fastened to the hook, or bait, in a curious manner, and is attached to a bamboo cane, twelve or fifteen feet long. Two or three persons then go out in a light canoe, and when they perceive a shoal of the above fish, the person angling throws the hook, keeping the rod at such an elevation as to allow the hook only to touch the edge of the water. When the fish approach it, the rowers ply their paddles, and make the canoe fly rapidly along, the fisherman always keeping the hook skimming on the surface of the water, so as to resemble a flying-fish, the similarity to which being also increased by a number of strong bristles attached to the end of the shell, in imitation of the tail of that fish. The dolphin or bonito dart after it, and is soon hooked. Two men will sometimes catch twenty or thirty of these large fish, by this ingenious contrivance, in the course of the forenoon. Since their intercourse with Europeans, English hooks have been introduced; but still the natives would rather have a nail, or piece of wire, out of which to fashion one for themselves; and the pearl-hooks are still preferred to all others.

The islanders display great neatness in the erection of their buildings, which are constructed, in general, in the exact form of the English houses—that is to say, with a sloping roof, and square or parallel gables and sides. They are built, of course, entirely of wood, and are thatched with the leaves of trees in a manner that would do credit to the most experienced thatchers in Britain. Many of the chiefs' houses are exceedingly large, some of them being capable of containing two or three thousand people: some of them are a hundred and fifty feet long.

The manufacture of native cloth was formerly one great source of occupation and subsistence amongst the islanders. It is composed solely of the fibrous bark of various trees—chiefly that of the wanti, or paper-mulberry, the aou, and the breadfruit tree. When the latter is used, the outer rind is scraped off with a shell; it is then slightly beaten, and allowed to ferment in water. A large beam of wood is then laid on the ground, and the bark laid lengthwise across it. The *manufacturer* then takes a square wooden mallet of ironwood, about 18 inches long, grooved on two sides, one side being very coarse, and the other very fine; a third side is cut in chequers of a lozenge form. With this implement he beats the bark, first with the coarse side, and then with the finer ones, keeping the bark all the while saturated with moisture. By this beating the fibres of the bark are completely interwoven, the resinous matter in it rendering them perfectly adhesive; and when the piece is finished, the texture is often fine and even, while the inequalities occasioned by the lozenge-cut side of the mallet gives it the appearance of woven cloth. This is the whole process of manufacture; and yet it is almost incredible that they will thus make bales containing 200 yards in a piece, and four yards wide! The cloth is afterwards bleached, dried, and rolled up. That made of the paper-mulberry is capable of being bleached beautifully white. The natives of the Society Islands have a variety of vegetable dyes, which they use so as to produce beautiful patterns or figures on the cloth. The cloth is all manufactured by the women, with all classes of whom it is a point of competition to excel in it; and it is customary to remark, on seeing a superior piece of cloth, "it is as fine as if it had been made by the queen."

Even in their native games, exercises, and amusements, the South Sea Islanders approximate more nearly to the customs of civilized nations, than, from their utterly barbarous and untutored state, could possibly have been imagined. They know, it is true, little or nothing of music, almost their only instruments, whether in war or festival, being the drum, and a *bu* or trumpet; the latter being merely a large conch shell sounded through a bamboo cane inserted near its apex. They have also a flute, used in their domestic festivities, which is played with one hand, and blown—by one nostril! The notes are of course few, but soft and pleasing.

(To be continued.)

NATURE.

By Allan Cunningham.

O, Nature! holy, meek, and mild,
Thou dweller on the mountain wild;
Thou haunter of the lonesome wood;
Thou wanderer by the secret flood;
Thou lover of the daisied sod,
Where Spring's white foot hath lately trod;
Finder of flowers fresh-sprung and new,
Where sunshine comes to seek the dew;
Twiner of bowers for lovers meet;
Smoother of sods for poets' feet;
Thrice-sainted matron! in whose face,
Who looks in love will light on grace;
Far-worshipp'd goddess! one who gives
Her love to him who wisely lives;—
O! take my hand, and place me on
The daisied footstool of thy throne;
And pass before my darken'd sight
Thy hand, which lets in charmed light;
And touch my soul, and let me see
The ways of God, fair dame, in thee.

Or lead me forth o'er dales and meads,
Even as her child the mother leads;
Where corn, yet milk in its green ears,
The dew upon its shot blade bears;
Where blooming clover grows, and where
She licks her scented foot, the hare;
Where twin-nuts cluster thick, and springs
The thistle with ten thousand stings;
Untrodden flowers and unpruned trees,
Gladden'd with songs of birds and bees;
The ring where last the fairies danced—
The place where dank Will latest glanced—
The tower round which the magic shell
Of minstrel threw its lasting spell—
The stream that steals its way along,
To glory consecrate by song:
And while we saunter, let thy speech
God's glory and his goodness preach.

Or, when the sun sinks, and the bright
Round moon sheds down her lust'rous light;
When larks leave song, and men leave toiling;
And hearths burn clear, and maids are smiling;
When hoary hinds, with rustic saws,
Lay down to youth thy golden laws;
And beauty is her wet cheek laying
To her sweet child, and silent praying;
With Thee in hallow'd mood I'll go,
Through scenes of gladness or of woe;
Thy looks inspired, thy chasten'd speech,
Me more than man hath taught, shall teach;
And much that's gross, and more that's vain.
As chaff from corn, shall leave my strain.

I feel thy presence and thy power,
As feels the rain yon parched flower;
It lifts its head, spreads forth its bloom,
Smiles to the sky, and sheds perfume.
A child of woe, sprung from the clod,
Through Thee seeks to ascend to God.

—*Edinburgh Literary Journal.*

MANNERS.

With virtue, capacity, and good conduct, one still can be insupportable. The manners, which are neglected as small things, are often those which decide men for or against you. A slight attention to them would have prevented their ill judgments. There is scarcely any thing required to be believed proud, uncivil, scornful, disobliging—and still less to be esteemed quite the reverse of all this.—*La Bruyere.*

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, John Macleod, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

In Dublin, another Edition is published, with the permission of the Proprietors, by William Curry, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

THE PARTED.

THOUGH nothing can be more honourable than opulence acquired by industry, it often happens in a large manufacturing town, that individuals spring from a penurious origin to the possession of enormous wealth, without acquiring those generous habits of thinking and feeling which alone can render affluence respectable. Pinched and scorned in their early days, they contract a notion that the opposite of all evil is in the mere exemption from poverty, that all men who do not make money are either imbecile or dissolute, and that they are in no danger of offending against any of the rules of life, if they only keep their gold from waste.

Old James Bisset was a person of this kind, who flourished a considerable number of years ago in Glasgow—a city which, though containing many men who have alike gained fortunes by honourable means, and enjoyed them in a creditable manner, must necessarily be the habitation of some others, characterised in the way we have described. The individual we are alluding to had originally been a small shopkeeper. Lucky turns in trade, joined to indefatigable industry, ultimately enabled him to become the principal shareholder and director of a bank, in which line of business he realised a fortune which was literally beyond calculation. Day after day, with the most pertinacious regularity, did he assume his seat in a small screened space in the telling-room, where he was ready, without appearing publicly, to be consulted on all occasions of difficulty. With what a knowing air would he handle any odd kind of bill that was presented to him! How keenly, and yet at the same time coldly, would he inspect signatures which he was not very much in the habit of seeing! Were the presentee a somewhat embarrassed trader, struggling, by means of bills, to avert the destruction which they only rendered the more certain and deadly, James was sure to have heard some *inkling* (to use one of his own phrases) of what was going forward, and the answer accordingly was given, with a polite smirk, enough to sink the victim into the earth—"It is not just convenient." Were the applicant a young man recently entered into business, and not very well off for capital, then, whatever might be his personal merit, whatever his industry, whatever his prospects in trade, it was—"We do not know the parties." The first time I saw Bisset was in his own bank. He happened to come forth from his den, to say something to a clerk, and I took him fully into my eye as he crossed the floor. There he was, with his neat person, marked with a dash of the antique—his substantial west of England black *stand of clothes*, small silver buckles at the knees, clear black shoes, and white scanty hair—the very beau-ideal of a close careful man, of rigid uprightness and propriety in all things, but—no feeling. If, thought I, this man hath a daughter, how difficult to get a man good enough for her! If he have a son, how impossible for that son to "be every thing that his father could desire!" In this man's estimation, the world must be a scene of almost unmixed unworthiness. Not one man in five hundred will be any thing in his eyes. If the whole of mankind were worth a plum each, it would be paradise once more. But there being few so very *good*, it must be like the doomed city, with not nearly a sufficient exception of respectability to save it from general contempt. How, thought I, would this man act if he had a child in the situation of Belvidera, or Juliet, or Ophelia!—for, strange as it may seem, even this hardened mass of feelingless clay might quite well, in the course of nature, be the father of some being, matching, in softness, and affection, and sensibility, all or any one of those creatures of the imagination.

There were, as I afterwards learned, some circumstances in the family of Mr Bisset, which had tried his heart in a way not far different from what I was supposing—but found it wanting. He had but one daughter, Anne, who had married a person of her own rank some years before, when her father was as yet but a rising and struggling man. This person, whose name was Inglis, prosecuted business for years with success, but eventually, owing to the rise in his style of living, which the ambition of his wife demanded, in order to keep pace with her father's advancing greatness, while that father would never render his son-in-law the least assistance, he became—to use a well-understood phrase of delicacy—unfortunate. The ruin of the son-in-law produced hardly a changed muscle in old Bisset. He only remarked, one day, that he had never had any very good opinion of that frequent advertising practised by Mr Inglis, and had often told him so, but without effect. "And then his own extravagance," said the old gentleman, with a generous forbearance of all further explanation. This coldness, however, would not do. Bisset soon found, that, if Inglis could not support his wife and his children, he would be obliged to support his daughter and his grandchildren; and he therefore allowed himself the luxury, and claimed from the world the merit, of doing his son-in-law the great kindness of setting him once more up in business. His advances, however, were in such a form as to give him a complete dominion over Inglis, so long as they were not repaid—a power he exercised to its fullest extent, in pestilent and querulous interferences in every movement made by his son-in-law. The consequence was, that the young man lost heart, and really became guilty of the very errors which Bisset wished him to avoid. His business, which at first showed some symptoms of revival, began to decline; ordinary obligations were answered with some difficulty; and application was made for further advances to Bisset, who, so far from granting them, was only incited to look the more sharply after what he had already given. Finally, to gain some paltry preferences upon the estate of his son-in-law, he forced him a second time into the pit of ruin, from which, of course, a second redemption was not to be hoped for. "Far better," said Bisset, "to support my daughter and her family by a direct outlay, than vainly endeavour, at an infinitely greater cost, to keep her up through the means of that rascally dog of a husband."

Inglis, who was in reality a man of good dispositions, though of soft and rather indolent character, was never able, after this event, to hold his face up in the world. Mortified more by the cruelty of his wealthy relative than even by his disagreeable position in mercantile society, he sunk for a time into dissipated habits, and was accordingly given up for lost by all his former friends. The world was at the same time partly aware of the severity with which he had been treated, and seemed fully disposed to pity and befriend him; but, as it invariably happens, any good that might have arisen from this state of public feeling, was neutralized by the impossibility of relying upon the conduct of the man himself—for how can any employer, or any one who has credit to dispense, depend upon the behaviour of a tippler?—a man who may to-day contract obligations with the full and conscientious design of fulfilling them honourably, but whose best resolutions may be dissipated to-morrow before the temptation of that meanest of all indulgences, a dram! Thus Inglis went down, and down, and down, without the least power, apparently, to avert his own decline. His father-in-law had never seen him since the period of his second failure. He pretended that he could not endure to look upon a man who had injured him so much, and whose conduct was so far from reputable. His daughter he proposed to take home into his own house, along with her children, amounting to four in number, but only on the strict understanding that she was never again to meet her husband.

Mrs Inglis was one of a somewhat uncommon class of women, but who, nevertheless, *are* a class—cold, tame, and self-indulgent; capable of discharging carefully the most of the minor duties of life, and even, perhaps, notable for good general behaviour, but who are totally unfit, when called upon, to act upon high and self-denying principles. Her husband she liked well enough; but then she liked her father too. She would have been well content to continue living with her husband; but then his circumstances were not such that she *could* live with him. And the children—what was she to do with them? Ought she not rather to leave her husband, in order to ensure their support and comfort, than stay with him, and see them subjected to all conceivable hardships? In short, she found far more than the requisite excuse to commit the *great sin* of parting with her husband on the terms proposed by her father. She went to the enjoyment of every luxury that tongue could name or heart desire, to bring up her children like the sons of princes, and to be the fondled pet of a doating father, who could never see wrong in either her sayings or her doings; while he, whom she had sworn never to part from, for any thing that the world could either give or take away—the father, too, of those children—the being with whom she had once seemed to share an absolute community of existence, was shred away from her like a noxious weed, and left to find his own solitary and cheerless way through the world, with no hope except in the correcting vengeance of that Deity whose laws she had so shamelessly violated.

Inglis now became a thorough prey to fortune. For a while, but only a little while, after their parting, his wife was worked upon by his written solicitations to send him small sums of money, which she had saved off the allowance made to her by her father; and she even ventured on one occasion, at the risk of being turned out of her splendid house, to pay a stolen visit to her unhappy partner, at a time when he was supposed to be dangerously ill. Soon, however, even this intercourse ceased. Exposed every day to hear her father's sentiments respecting Inglis, she insensibly became hardened towards him, looking upon herself, and her children, and her father, as forming a particular system by themselves—one of great magnificence and unimpeachable virtue and propriety—and her husband as a poor and disreputable object, which was quite alien to the former. Then came a time when the sight of her shabby husband would occasionally cross her sight on the streets, to wither all the enjoyments amidst which she lived, and she would shrink away from the accusing spectacle, like a murderer from the sight of blood—thinking that every eye in the surrounding crowds was intent in estimating the contrast between her own luxurious condition and the abject misery of one who was still, let her do what she would, a part of herself. Then came a time when her children, growing up to observation of the world, would ask if they also, as well as their companions, had a father?—and where was he?—and would they ever see him?—and would he bring them home playthings, like other fathers whom they named, who were long from home?—questions that, like lashes, brought each away a piece of the very flesh along with it, though rather by the humiliation they inflicted, than any feeling of remorse. One day, the eldest girl, who, contrary to custom, had been permitted to wander into the town, came home quite breathless

with surprise and haste, saying that she had been seized on the street and hurried into an alley by a horrid-looking man, who called himself her father, and insisted on kissing her several times, which, when she resisted, with cries that alarmed some people who were passing, he set her down hurriedly, and ran away out of sight, leaving her, she said, with her face all covered with his tears. Still greater care was taken thereafter to prevent the children from wandering out of sight; but not long after, as the gay and gorgeous lady was stopping in her carriage at a shop in Argyle Street, with her four beautifully dressed children around her, Catherine suddenly started up, and, pointing to some one on the pavement, cried, "There, mamma! there is the bad man who called himself my father!" And, on her involuntarily turning to the object thus indicated, her eyes were met by another pair, so wild, so mournful, and so full of painful meanings, that she had hardly breath to ask the coachman to drive on.

A time at length came when this very child was seized with what appeared a mortal illness. Both mother and grandfather were watching over her in a state of inexpressible grief, and every moment was expected to be her last. At the height of their sorrow, a hurried but subdued knocking was heard at the outer door, and presently after there arose the sound of a scuffle between the servant and some one who wished to make a forcible entrance. "Shall I not see my own child?" cried a hoarse and broken voice, which, all altered as it was, they knew too truly to be that of the unfortunate Inglis, and presently after he burst wildly into their presence. The lady fainted, and, while Bisset stood trembling with rage in the middle of the floor, the desperate man approached the bed of the dying infant, whom he took tenderly in his arms, and kissed with the most affectionate fervour. "What right—by what—what right," cried Bisset, almost choking with passion, "do you make this intrusion? Sir, I tell you, you have no right to be here." And he stopped from absolute inability to command his voice. "I have a right to be here," replied Inglis, after having carefully laid down the child. "Your house, perhaps, and yourself, and these staring servants there, are not in any way under my control; but to this child, sir, I *have* a right. She is mine, by the laws of both God and man, and I could this moment take her for ever from your sight, even were you to see her gasp her last in my arms before we reached the door. You know this, sir; and, cruel and base as you are, you cannot dispute it. Nor that lady there," he added, with a bitter sneer, "when she revives from her amiable trepidation, could she deny it either."

"In the name of God, then," said the miser, awed by the very wrath of his wronged son-in-law, "what do you mean to do? Your violence, however we may bear it, must be most distressing to this dying innocent, and may even prove the immediate cause of her death. Would it not be better that you quietly retired, now that you have seen what you wanted to see?"

The unhappy man could make no answer. His eye was fixed in silence upon his child, whose countenance at this moment began to exhibit the unequivocal symptoms of coming dissolution. "My Catherine—my Catherine!" he cried, and next moment clasped a lifeless corpse. A few minutes thereafter, rendered unresisting apparently by his intense grief, he permitted himself to be led peaceably to the door, and gave the afflicted house no more trouble.

It is often of advantage to a man who has entered upon evil courses, that something should occur to give an agitation to his whole system of feeling. The shock of some tremendous grief, like a thunder-storm in the elements, seems to clear the mental atmosphere, and fit him for once more commencing, if his passions will permit, the career of virtue. Inglis, apparently reformed, now proceeded to Edinburgh, where he had no evil reputation to contend with, and, on the strength of a small sum communicated to him, in a letter of partial kindness, by his wife, opened a school for such branches of education as he found himself qualified to teach. The attempt, though unprosperous at first, was beginning to be attended with some small share of success—his manners being, at the same time, observed to continue quite irreproachable—when he was seized by a severe chronic disease, which disabled him for a whole winter, and left him, at the return of spring, without a penny in his pocket, or a pupil in his academy. His life, after this disaster, was one unbroken scene of distresses, pecuniary and otherwise, and, but for the slender succour which was occasionally rendered to him by the good will, rather than the ability, of his poor neighbours, he must have died of hunger. The unfortunate always herd with the unfortunate; the unfortunate are to the unfortunate almost a sole refuge and shelter; the unfortunate alone can judge of and feel for the unfortunate; while no other can properly be to them either a companion, or a benefactor, or a judge. Inglis, while deserted by a wife, the crumbs of whose luxury would have been to him an ample furnishing, and overlooked by all men who were once his equals, found in those who were nearly as destitute as himself, the only friendship he ever experienced, the only true sympathy for his condition, the only alms that any one would give. Blessings, double blessings, be on the generous poor!

It happened in the revolutions of life, that an intimate friend of the writer of this narrative became acquainted with the story and circumstances of the unfortunate Inglis, and was able to do something for the alleviation of his many troubles. He found him to be, upon the whole, a man of an inoffensive character, of some acuteness of mind, and more than the average of information, but outworn with past excesses, and the attrition of a perpetual grief. He spoke little of his misfortunes or of his family; but one day, being rather more depressed than usual, and the cause being asked, he said he had just heard that his second son, whom he had not seen for many years, was about to come to the capital, for the purpose of studying for the bar, and being certain that the young man would be there without ever inquiring for his father, or perhaps being aware of his existence, he had experienced more than usual distress of mind from the consideration of his extraordinary circumstances. My friend could not help acknowledging, that, even after enduring so much, a new circumstance, involving so unnatural an association of ideas, might well be expected to give him additional uneasiness.

This ill-used man at length died in a humble lodging, where he existed solely upon charity; and his wife, being written to on the occasion, replied by the simple transmission of a sum of money sufficient to bury him and discharge his little debts. No notice was taken of the event by his family. His widow wore her usual gay dresses; his children were not even informed of their loss; his name was "never heard."

God, however, in due time, seemed (as far as mortals might be permitted to interpret his decrees) to manifest his sense of this unholy violation of one of his earliest and most solemn injunctions. The children, in whom the mother and grandfather took so much delight, were one after another snatched away by the various diseases of childhood and youth, till not one was left to console their age, or inherit the wealth which had so absurdly been hoarded for them. The loss, it may well be supposed, was mourned with tears of double bitterness, for it was impossible to take such a calamity as an occurrence altogether within the ordinary course of nature. The lady was so much exhausted by her exertions for her children, that she took ill immediately after the death of the last, and, mental anguish aiding in the progress of her malady, she did not live many weeks. Bisset, who apparently had never thought it possible that he could be predeceased by his daughter and so many blooming children, was, by this event, struck with a kind and degree of grief altogether foreign to his nature. He yet survives—but only as a spectacle to excite the pity of those who know him. Palsied, fatuous, and blind, he is nothing but a living block; nor can all his gold, immense as it is in amount, reflect one consoling ray on his decline. His wealth, which, if well used, might have spared him the life of the only being he ever loved, and kept other hearts besides from breaking, will speedily be dispersed among a number of distant relatives, who neither care for its present owner, nor will be advantaged, perhaps, by its possession.

THE YOUNG CHEMIST.—No. I.

We have not hitherto introduced much of chemistry into our columns, and perhaps many of our readers will be frightened at the very outset with the abstruse word, not knowing the real meaning of the term. The fact is, however, there is none of the sciences the operations of which are more familiar to us in every-day life than that of chemistry. We are all chemists more or less, though we may not be conscious of it. The cook, the baker, the brewer, the artizan of almost every description, daily and hourly are performing some nice and intricate chemical experiments of some kind or other; and perhaps no science has contributed in modern times so much to the comfort and convenience of man, or served, by the full light which it has shed upon familiar objects, to banish vague superstition, or correct the false notions which we had formed of things. Perhaps, too, there is no species of science better fitted for awakening the youthful mind to thought, and for training it to activity and precision. We found it so with ourselves, and it happened thus:—

In the dawn of our college life, we found ourselves, like nine-tenths of our companions, idle, listless, and ignorant of every thing around us, past, present, and to come, with the exception of some crude notions about the Greeks and Romans, gleaned from the repeated connings of our daily school tasks. Our mind seemed active, too, poking about, and seeking for exertion; but it had nothing with which to busy itself; no end, or aim, or palpable materials to work upon: perhaps it would lose whole hours in a wild reverie of the imagination, or expend its energies in the grotesque phantasmagoria of a fairy tale. In this state, we by mere accident accompanied a senior student to a chemical lecture. Immediately, as if by magic, a new spark of fire was elicited within us; we were introduced into a new region of existence; that which the eager mind had sought for, it found, and henceforth, for many a day, whether we waked or slept, or ate or drank, we lived a chemist: our little room was forthwith converted into a laboratory; every shelf and cranny was stuffed with phials and gallypots; glass tubes, blowpipes, and air-troughs, occupied floor and table; all boyish follies and triflings were laid aside, every spare hour was devoted to deep, but delightful and soul-abstracting study; and hence the young chemist led the life of a genuine philosopher. Of all pleasures, perhaps the greatest and most intoxicating is the taste of the first-fruits plucked from the tree of science. It undoubtedly renders even the most modest youth at first ridiculously inflated by the shallow draughts of a little knowledge; but as he drinks deeper, all this passes off, and he sinks into the sober philosopher again. It was usual for the young chemist in those days to lecture his brothers and sisters seated round the breakfast or dinner table—to show them that table-salt was not the vulgar thing they had all their lives supposed, but that it was a *muriate of soda*, or a mixture of muriatic acid and the common alkali soda. He demonstrated to them, too, that sugar was not a simple substance, and, under all its changes, characterised as the sweetener of tea or coffee, but that it could be separated into three distinct parts—carbon, or a substance exactly the same as burnt wood, and two airs, hydrogen and oxygen, which were as transparent and invisible as the air around us that we breathe. He showed that what we termed cold, was nothing, in reality a mere empty name; and that bodies were cold just because they did not possess the principle of heat; that when we touched the cold marble slab, it was not the cold coming to our fingers which we felt, but the heat running from our body by the fingers, and passing into the slab. In short, whether the family circle ate or drank, were cold or warm, wet or dry, the young chemist could give them a philosophical reason for all. It is true, mamma and the elder sisters of the group were sometimes terribly alarmed at strange bursts of flame, suffocating smells, and repeated loud explosions that not unfrequently issued from the room of the chemist; and stained clothes and disfigured linen were circumstances not unfrequently of regret and vexation; yet, on the whole, they used to declare that they would much rather have a dozen of young chemists than half that number of idle, mischievous, and stupid or unintelligent boys. We believe the young chemist was, on the whole, a source of secret pride, and esteemed a source of infinite amusement, and the vehicle of no small rational instruction to his happy family group.

But we have not yet exactly told what chemistry is. All substances on the face of the earth have certain properties. They are either sweet, or sour, or bitter, or they have no taste at all: they are hard and solid as a piece of metal or stone, or they are fluid like water, or they are light and transparent like air. Many substances, too, when you put them together, mix instantly and form one; but many, on the contrary, will not so mix. Thus, if you drop a lump of sugar into a glass of water, it immediately dissolves, and you have a thin sweet liquid; but if you drop a pebble into this water, you have still tasteless water, and an undissolved pebble at the bottom. Again, if you take a glass of lemon juice, and about a teaspoonful of common soda in powder, and mix them together, you have a violent bubbling up, or effervescence, while the whole of the soda is dissolved in the lemon juice; but if you examine and taste this liquid now, you will find that it has neither the sour taste of the lemon, nor the peculiar taste of the soda, but a distinct sharp taste, different from either: these two substances have combined, and formed a third, a salt, having peculiar properties of its own. In this way you may go through every substance in nature; and inquiries of this kind into the mixture or combination of substances into their properties of dissolving or not dissolving in certain fluids, and, in short, every circumstance relating to them and their actions in this way, has been called the science of chemistry. It will thus be seen that it is a wide and interesting field, embracing an acquaintance with every thing around us, whether of earth, or water, or air, or the solid and fluid parts of vegetable and animal bodies.

Now, chemists are an active, poring, and indefatigable race, from the very youngest to the oldest of them; and by their labours for the last hundred years (for within this period we may say the great bulk of chemical knowledge has been acquired), it is made manifest, that, however various and innumerable may be the different forms of things around us throughout the world, yet not much more than fifty distinct kinds of matter exist; that is, we have about fifty-four simple substances, by the mixture of which in a variety of ways, and in different proportions, all salts, and sweets, and sours, all rocks, and gems, and water, and air, and vegetables, and animal bodies, are produced. These substances are called simple, because, having been subjected to all sorts of trials, they cannot be farther separated, and may be said to be the essence or first principles of matter. Thus, if we take a little common salt, and subject it to various operations, we can separate it into two distinct substances, an acid and an alkali, or the common soda; again, by mixing these two substances, we reproduce common salt. It

is evident, then, that it cannot be a simple substance. But if we take a piece of gold, and treat it in all manner of ways, we can never separate it into any thing more simple than just gold; or if we take a little pure sulphur, we can never make it less, or other than pure sulphur. Hence these substances have been termed simple.

We have, then, about fifty-four of these simple elements in nature; and did they always remain in their simple state, we would have a condition of things very different from what is before us. But this is not the case. Rarely, indeed, are they found separate: they like to join, and intermarry, and keep companionship; and hence proceed daily new shapes and ever-changing variety. The modes in which bodies unite are innumerable, and the metamorphoses which they undergo are beyond all the changes which have excited the juvenile wonder at a Christmas pantomime. Thus, one would not readily believe that the same substances when mixed in one proportion would form the mild and transparent air of the atmosphere, while the very identical substances under a different mode of mixture constituted the well-known substance aqua fortis, or nitric acid; and yet such is the fact, the substances being oxygen, or vital air, and nitrogen. The circumstance, at first, no doubt, appears incredible, that common river water is composed of two airs, oxygen and hydrogen—the latter so highly inflammable that it bursts into explosion on the first touch of fire. Yet such is the fact, and it can be easily proved; for if a small jet of hydrogen gas or air be set fire to within a jar of oxygen gas, the burning will produce many drops of pure water on the sides of the jar. Moreover, if water be passed drop by drop through a gun barrel heated red-hot in the middle, it will be decomposed, or separated into parts; one part, the hydrogen, will escape at the end of the barrel, and may be set fire to; the other part, the oxygen, enters into combination with the heated iron. On examining a rocky mountain, the young chemist has seen his audience stare as he explained to them, that of those rocks perhaps a fourth part, or in some instances nearly a third, was composed of oxygen, or the pure light and transparent air of the atmosphere, or that the limestone mass at their feet could easily be separated into a somewhat heavy air, and pure or quick lime, the volume of the former being so great in proportion, that a piece he could hold in his fingers will contain as much air as would fill a large room. The proof of this, however, is as simple as possible. Take a wine glass half full of water, into which drop another half of muriatic acid; then place into the mixture a small knot of chalk; immediately a copious action takes place, and innumerable bubbles of air mount upwards, which, if collected, would show the volume of the gas as compared to the small ball of chalk. All substances, then, of whatever kind, can exist in three states—the solid, fluid, and the aëriform; and, in fact, all substances on the face of the earth are constantly shifting and changing into all these different conditions. The cause of these changes is the great and important agent, heat, called, in the language of chemistry, *caloric*. Thus water, if it has a small allowance of heat, becomes a solid piece of ice; with a little more heat, it becomes the common fluid water; with a still greater heat it passes into vapour or air. Thus, also, lead is a solid at the usual temperature; if heated to a great degree, it melts into a fluid; if still farther forced by caloric, it rises into a vapour or air. It is the same with every body in existence. And before treating farther of chemical subjects, we must pause to consider something of the laws of heat, and the influence which this agent or substance, or whatever it may be, exercises on this wonderfully constituted globe. We must, in concluding for the present, remark, that, in chemical, as well as all other sciences, certain hard names do occasionally occur, and many circumstances must be mentioned at the first outset, without full explanations of their meanings being given; for it is only as the student advances, and his knowledge increases, that he can comprehend explanations of those, and of many other minutiæ of the science. For the sake of joining amusement with instruction, we may often ramble a little as we tread the pleasing field; yet the reader who follows us attentively will always be sure to find method in our ramblings.

A GENTLEMANLY DOG.

I was once in possession of a very fine house-dog, which had formerly belonged to Covent Garden, but, for killing a man accidentally in the dark, was discharged. Pasquin came to my house one Saturday morning, to get "my bones:" but Mrs Bernard and myself were out, to give the servants free dominion with their mops and buckets. The door being open, Pasquin walked in, and intended to enter the parlour; but the dog was lying on the mat before it, who, mistaking the former either for the dustman or a coal-heaver, rose on his hind legs, with a sense of the impropriety, and placing his paws to the stranger's shoulders, actually walked him back to the threshold, where he dropped to the ground, and looked him up in the face. The maid was descending the stairs at this instant, and perceived the whole affair. Now, this was not a more extraordinary proof of the good-breeding of the dog, than the unpleasantness of Pasquin's appearance—here was a gentlemanly dog turning out a dirty one.—*Bernard's Retrospections of the Stage.*

HISTORY OF THE ASSASSINS.

THE term Assassins has been long familiar in Europe, but little information has been given of the singular sect from which the name was derived. According to M. Von Hammer (a native of Germany, who, from sources purely oriental, has with great labour and research produced the latest and the best work on the nature and organization of this most extraordinary order), they were an order, at once military and religious, like the Templars, and like them, too, subject to the control and guidance of a grand master, who was named the Sheikh-el-Jebel, corruptly rendered, the old man of the mountain, who, from his seat at Alamoot, in the north of Persia, like the general of the Jesuits from Rome, directed the motions of his numerous and devoted subjects, and made the most haughty monarchs tremble at his name. From the work which he has composed on this novel and interesting subject, we shall attempt to give our readers some idea of the organization of the sect, and expose the mighty ills which may be brought on the human race, by the agency of secret associations, in the history of one of the most powerful and destructive which ever existed.

In the stormy period which succeeded the death of Mohammed, numerous sects sprang up among the believers of Islamism. One of these, the Mazdekee, professed universal freedom and equality, the indifference of human actions, and the community of goods; and, strange as it may appear, it numbered among its adherents Cobad king of Persia. The imprudence of this monarch cost him his crown, and his son Noosherwan, convinced of the pernicious influence of the sect, endeavoured to eradicate it with fire and sword. In this attempt he did not completely succeed, and the immoral opinions continued to exist in secret, until an opportunity offered, when they were again publicly promulgated, and Persia became the scene of blood and devastation.

At this period there lived at Ahras, in the south of Persia, a man named Abdallah, who had been educated in the maxims of the ancient religion and policy of Persia, and whose national animosity induced him to attempt the overthrow of the faith and the empire of the victorious Arabs. The only path to ultimate success, he saw, was to undermine them by secret means; and to effect his purpose, he enveloped his design in the veil of mystery, and in imitation of the schools of India and Pythagoras, communicated gradually his doctrines to his disciples. These consisted of a denial of all religion, with the belief that all actions are indifferent, and that neither here nor hereafter will they be rewarded or punished. With the greatest zeal, by means of missionaries, he disseminated his opinions, and augmented the number of his disciples, until at length one of them was placed on the throne of Egypt, and the new system was established in Africa. But it contemplated farther triumphs, and its missionaries overflowed Asia, in the hope of overturning the throne of the caliphs of Bagdad. Lodges of men and women were formed in different places, and the principles of the sect were taught in regular succession, according to the progress made by the members, or the confidence placed in their discretion. To believe nothing, and to dare every thing, was the sum and substance of this doctrine.

One of the converts to this abominable system was Hassan ben Sabah, who founded, some years after, the society which, during a century and a half, filled Asia with terror and dismay. Hassan was one of those characters which appear from time to time in the world, as if sent to operate some mighty change in the destinies of mankind. Endued with mental powers of the first order, conscious of his own superiority, filled with the most immoderate ambition, and possessed of the courage, patience, and foresight requisite for the accomplishment of his deep-laid schemes, he had been sent by his father, whose orthodoxy was suspected, to Nishaboor, to be educated by one of the most learned men of the East; and there he formed an acquaintance with several noble youths, who afterwards raised themselves to the highest dignities of the state. Even at this early period, the ambitious mind of Hassan, and his sanguine expectations of future advancement and dignity, displayed themselves, and he was not long of seeing them realised. He was taken notice of by the Sultan Melek Shah, and was soon after made his principal confident. By one of those intrigues common in courts, he was, however, in a short time deprived of the favour of his sovereign, and was dismissed with disgrace. Burning with rage and disappointment, he retired to Rei, and thence to Ispahan, and after a short stay there, he proceeded to Egypt, to join the grand lodge of the Ismaelites, a name which the secret society had assumed, and of which society he had for a long time been a member.

Hassan, whose fame had preceded him, was received in Egypt with the highest honours; but soon after, happening to take an active part in a dispute relative to the succession, his enemies prevailed against him, and he was sent into banishment. He disembarked in Syria, and spent several years in travelling in the different nations of the East, zealously spreading his doctrines, and acquiring proselytes. His ambition now was to possess dominion as well as power, and he fixed his eye on the castle of Alamoot (the vulture's nest), a lofty and impregnable fortress in the district of Roodbar, to the north of Kasveen. This he gained partly by force, and partly by stratagem. So soon as he got possession of this hill-fort, Hassan changed his plans, and instead of publicly treating all religious belief as the effect of a disordered imagination, he determined to maintain among his followers the religious discipline of Islamism in all its rigour. The most minute observance of the most trivial ordinances was exacted from those who, generally unknown to themselves, were leagued for its destruction; and the veil of mystery behind which few were permitted to enter shrouded the secret doctrine from the eyes of the major part of the society.

The Ismaelite doctrine had hitherto been disseminated by missionaries and companions alone: a third class was required, which, ignorant of the secret doctrine, would blindly obey the orders of their superiors. This class was named Fedavee, or the Devoted. The members were clothed in white, with red bonnets or girdles, and were armed with daggers. These were the men, who, reckless of their lives, executed the bloody mandates of the Sheikh-el-Jebel, the title assumed by Hassan. As a proof of the fanaticism which Hassan contrived to instil into his followers, we give the following instance. In the year 1126, Hasim-ed-devlit Absoucar, the brave prince of Mosul, was, as he entered the mosque, attacked by eight assassins disguised as dervises; he killed three, and the rest, with the exception of one young man, were cut to pieces by the people; but the prince had received his death-wound. When the news spread that Hasim had fallen by the daggers of the assassins, the mother of the youth who had escaped painted and adorned herself, rejoicing that her son had been found worthy to offer up his life to the good cause; but when he returned, the only survivor, she cut off her hair and blackened her face, through grief that he had not shared the glorious death of martyrdom.

A display of the means by which the chief of the Assassins succeeded in refusing this spirit of unbounded faith and devotion into his followers, forms an interesting chapter in the history of the human race. Those who reflect on the follies of the disciples of the various fanatics and impostors who have deceived mankind, will not be surprised at the blind devotion of the Fedavee. Even in our own days, the chief of the Wahabees could persuade his followers that he had it in his power to dispose of the mansions of eternal bliss.* It is not undeserving of remark, that the two powers which waged war simultaneously upon Islamism, were both stimulated, by their spiritual heads, with the same prospects of reward. Those who fell in the crusades were pronounced by the Pope to be martyrs, and entitled to the kingdom of heaven; and to the Fedavee who fell in executing the mandates of his superior, the gates of paradise were thrown open, and he entered into the enjoyment of the ivory palace, the robe of silk, and the black-eyed houries. This, it is said by Marco Paolo, was no ideal reward. At Alamoot and Masiat in Syria were the most delightful gardens, into which the young novice was, while in a state of stupefaction, the result of some narcotic, introduced; and there, amid a succession of pleasures, presented with a foretaste of the joys of a Mahometan paradise. Ever after, the rapturous vision possessed the imagination of the deluded enthusiast, and he panted for the hour when death, received in obeying the commands of his superior, should dismiss him to the bowers of the celestial paradise.

Here we have the true origin, according to De Sacy, of the term Assassin. Hyde derived it from Hassa, to kill; others from the Jewish Essenes; the prevailing derivation, which is also adopted by Sir John Malcolm, is from Hassan, the first chief; Lemoine was nearer the truth when he derived it from a word signifying herbage, and consequently gardens; but, according to De Sacy, whose opinion is adopted by Von Hammer, the true root is hashish, which signifies the bangue, or opiate of hemp leaves; and that the Assassins obtained their appellation from the use they made of the opiate prepared from that plant.

The power of the order now began to be exhibited. By force or by treachery, the castles or hill-forts of Persia in succession fell into their hands. A bloody period ensued; the doctors of the law excommunicated the adherents of Hassan, and the Sultan Melek Shah gave orders to his generals to reduce their fortresses; the daggers of the Assassins were opposed to the swords of the orthodox, and the first victim to Hassan's revenge was the companion of his youth, the great and good Nizamul-mulk, the prime minister of the sultan, who fell by the dagger of a Fedavee. His death was followed by that of his sovereign, who was suddenly carried off, not without strong suspicion of poison.

At the period of the crusades, the Assassins appeared in Syria, and, by means of Riswan, prince of Aleppo, acquired fortresses in that country. In Syria, as in Persia, they were persecuted and massacred; and there, also, the dagger amply avenged those who fell by the sword. After a protracted contest in Persia, a dagger was one morning found stuck in the ground by an unknown hand, at the head of the Sultan Sanjer. This reminded him of continued enmity, and induced him to seek for peace. A treaty was in con-

* A follower of the modern Wahabee, who, a few years ago, stabbed an Arabian chief, near Bassora, not only refused to save his life, but anxiously courted death, grasping in his hand a paper which he seemed to prize far beyond his existence. This when examined proved to be an order from the Wahabee chief, for an emerald palace and a number of beautiful female slaves, to be given him in the delightful regions of eternal bliss.

sequence entered into between the sultan and the sheikh of Alamoot. The Ismaelites agreed on their part to add no more to the strength of their forts, to purchase no arms or military machines, and to make no more proselytes, and the sultan released them from certain taxes, and assigned them a portion of his revenues as an annual pension.

After a reign of thirty-five years, Hassan hen Sabah saw his power extended over a great portion of the Mohammedan world. Three grand missionaries presided over the three provinces of Jebal, Cuhistan, and Syria, while, from his chamber at Alamoot (which apartment he left but twice during his long reign), Hassan directed the operations of his followers, and employed his leisure hours in drawing up rules and regulations for the government of the order. He died at a very advanced age, leaving no children, for he had previously put both his sons to death, the one for the crime of murder, and the other for trespassing some trifling precept of the Koran. When he felt the approach of death, he summoned his two superintendants, Keah Buzoorg and Abou Ali, before him, and appointed them his successors; Buzoorg to direct the civil and military, and Ali the spiritual affairs of the order.

Buzoorg trod in the footsteps of the founder of the order. Hostilities were renewed between him and the sultan, and Alamoot fell for a time into the hands of the enemy. But the power of the order had taken too deep root to be easily overthrown, and it soon recovered from its disasters. In Syria, too, though violently opposed, it extended its influence, and it was thus situated when the crusaders first came in contact with its followers. Their first approaches were of a friendly nature, for we find that Aboul Wefa, the Ismaelite Grand Prior, as we may call him, and at the same time chief judge of Damascus, entered into a treaty with Baldwin the Second, king of Jerusalem, to deliver Damascus into his hands, on condition of receiving the city of Tyre as his reward. The enterprise, however, failed; the governor got timely information of the plot; the vizier, the great friend and protector of the Assassins, was put to death; and an indiscriminate massacre of the Ismaelites took place, in which 6000 fell victims.

Buzoorg departed from the maxims of the founder, by appointing his son Mohammed as his successor. He was a weak and inefficient prince, but his son and successor, Hassan the Second, was of a more enterprising character. His vanity induced him, contrary to the prudent counsels of the founder, to set himself up as a teacher and illuminator, and by his foolish disclosures of the mysteries of his sect, he justified the curses of the people, the excommunications of the church, and the persecution of the order by the surrounding sovereigns. He was, after a short reign, murdered by his brother-in-law and his son Mohammed, who succeeded him. This prince rivalled his father in knowledge, and in the open disregard of all religion and morality. At this period, when the brave Saladin and the crusaders maintained a bloody war in Palestine, the grand prior of the Assassins was Sinan, one of those personages who have at various times in the East gained, by an extraordinary appearance of austerity and devotion in the eyes of the credulous multitude, the reputation of divinity. He gave himself out to be an incarnation of the Deity; wore no clothing but sackcloth; was never seen to eat, drink, or sleep; and, from sunrise to sunset, preached from the top of a lofty rock to the assembled multitude, who listened to him as to a god. Notwithstanding the risk he ran, on one occasion, of being murdered by his followers, who discovered him to be only a mere mortal, he retained his influence over them during his life, and at present his writings are held in high veneration by the remnant of the sect, which still lingers in the mountains of Syria.

Sinan had read the books of the Christians, and whether from conviction, or, what is more probable, from a wish for peace and exemption from tribute, he sent an ambassador to Almeric, king of Jerusalem, offering, in his own name, and in those of his people, to submit to baptism, if the Templars, their near neighbours, would remit the annual tribute of 2000 ducats which they had imposed on them, and live together in future in peace and amity. The king received the embassy with joy, agreed to all the conditions, offered to reimburse the Templars from his own coffers, and, after having detained the envoy and his suite some days, dismissed them with guides and an escort to their own frontiers. But as they approached their castles, Walter of Dumesnil, who, with a body of Templars, had lain in ambush, assaulted them, and in the fray murdered the ambassador. Almeric, incensed at this treacherous and cruel action, assembled the princes of the crusade, and, by their advice, sent to demand satisfaction of the grand master, Odo de St Amande. The haughty priest gave an evasive answer, which so enraged the king, that he ordered the murderer to be dragged from the habitation of the Templars, and thrown into a prison in Tyre. The perfidious grand master was himself soon after made a prisoner by Saladin, and in the same year perished unlamented in a dungeon. Almeric had no difficulty in exculpating himself in the opinion of Sinan; but all hopes of the conversion of the Assassins were now at an end, and the dagger, after a truce of forty-two years, was again brandished against the crusaders.

Its most illustrious victim was Conrad, marquis of Tyre and Montferrat, the guilt of whose death, both oriental and occidental writers agree in ascribing to the gallant Richard Cœur de Lion. Conrad was attacked and murdered in the market-place of Tyre, by two of the Assassins. The king of England was known to be his enemy, and Albericus Trium Fontium says expressly that the murderers were hired by him. Bohadin, the Arabic historian, thus writes:—"The marquis went to visit the bishop of Tyre. As he was going out, he was attacked by two Assassins, who slew him with their daggers. When taken and stretched on the rack, they confessed that they had been employed by the king of England. They died under the torture." He also observes, that nothing could be settled with Richard, "because he always broke off what he had arranged, by continually retracting what he had said. May God curse him!" Cœur de Lion, however much his countrymen may have wished to make him appear so, cannot, we are sorry to say, be declared innocent of the murder of the marquis. We shall not, however, insist upon this point, which has proved a subject of no little dispute, but only revert to the curious circumstance, that we should be beholden to an Arabic author for the knowledge of certain points in the character of a king of England.

The reign of Jellal-ed-deen, who succeeded his father Mohammed, was a period of repose for Asia. He directed all his efforts to restore religion and piety; sent circular letters for this purpose to the caliph and sultan, and other princes; was dignified by the doctors of the law, who were convinced of his sincerity, with the appellation of New Mussulman, and obtained from the caliph the title of Prince, which had never been granted to any of his predecessors. His harem made the great pilgrimage to Mecca, and the caliph gave precedence to his banners over those of many other princes. But his reign was too short to be productive of much benefit to mankind, and on his death, occasioned by poison, the dagger was again unsheathed by his kindred, at the command of his son, Ala-ed-deen, a boy of nine years of age, and the murder of the prince was avenged amid torrents of blood.

Ala-ed-deen, after a disastrous reign, was murdered in his turn, and was succeeded by his son, Roken-ed-deen, who had joined in the conspiracy against him. In his time, the caliph of Bagdad and other princes invoked the mighty Mangoo Kaan to rid the earth of this band of murderers, who rendered life wretched to those who dared to provoke their resentment, and the conqueror of the world gave orders to his brother Hulagoo to exterminate the hated race. His orders were obeyed. The treachery of the chief astronomer and vizier of the Assassin prince facilitated the operations of the Tartars; Alamoot surrendered; and Roken-ed-deen was brought a prisoner to the camp of Hulagoo. The other fortresses of the order followed the example of Alamoot, except Kirdeoo, which for three years resisted the efforts of the Tartar troops, when it fell into their hands. Orders for the indiscriminate massacre of the Assassins wherever found, were given by Mangoo, and, without distinction of age or sex, they fell by thousands beneath the sword of justice and of vengeance. Fourteen years afterwards, the Syrian branch was destroyed by Bibars, the great Mameluke sultan; and though the sect, like the Jesuits, still clung together, in hopes of once more attaining to power, the opportunity never presented itself. And the merchants and peasants who at this day still hold the speculative opinions of the order, are scarcely aware of the bloody part it once enacted on the theatre of the world.*

DESTRUCTIVE KISSING.

Cicero speaks of a bronze statue of Hercules which had the features worn away by the frequent osculations of the devout. Several instances of the same kind have occurred in modern times. The face of a figure of the Saviour among the bronze bas reliefs which adorn the Casta Santa at Loretto, has in this way been quite kissed away. The foot of the famous statue of St Peter, in the Vatican, has lost much of its metal by the continual application of the lips and foreheads of votaries; and it has been found necessary to protect the foot of the statue of the Saviour by Michael, in the Minerva, from similar injury, by a brass buskin.

BUSINESS.

Business, says a celebrated writer, is the salt of life, which not only gives a grateful smack to it, but dries up those crudities that would offend, preserves from putrifaction, and drives off all those blowing flies that would corrupt it. Let a man be sure to drive his business rather than let it drive him. When a man is but once brought to be driven, he becomes a vassal to his affairs. Reason and right give the quickest dispatch. All the entanglements that we meet with arise from the irrationality of ourselves or others. With a wise and honest man a business is soon ended, but with a fool and knave there is no conclusion, and seldom even a beginning.

REPLY OF DIOGENES THE CYNIC.

Diogenes the Cynic being interrogated what benefit he reaped from his barbarous philosophical researches, and his pursuit of wisdom—"If I reap no other benefit," says he, "this alone is sufficient compensation, that I am prepared to meet with equanimity every sort of fortune."

NATURAL HISTORY.

THE FOX.

The fox inhabits almost every temperate country in the world, and in each he is distinguished for craftiness of character. There is great diversity of opinion respecting the different varieties of foxes; some considering them simply as varieties, changed and modified in their form from local circumstances, while others rank them as distinct species. These differences, however, are not so conspicuous as in the great varieties of the common dog.

Of the distinctive properties between the fox and dog, the most striking is in the structure of the eye. In dogs, the iris uniformly contracts around the pupil, in the form of a circle; while, in the fox, if observed under the influence of a strong light, it is seen to close in a vertical direction, the pupil assuming the figure of a section of a double convex lens. The object of this provision is obviously to exclude the rays of light.

The fox is of a wild and ferocious disposition, so much so, that it is hardly possible to render him wholly tame. Perhaps there is no predatory animal more cunning than he is, not only in providing himself with a secure retreat wherein to repose and rear his young, but also in the stratagems he employs for catching his prey. He feeds indiscriminately on lambs, geese, fowls, hares, rabbits, and small birds of all kinds: his fondness for grapes renders him a great annoyance to the vineyards of France.

The fox seldom fails to establish his habitation near some farm or village, so that he may the more easily attack the poultry, which appear to be his favourite food; and he often commits great depredations in poultry-yards, destroying in a single evening every thing that has life. When all other kinds of food fail him, he will destroy serpents, lizards, toads, moles, frogs, rats, and mice; and when extremely pressed by hunger, like the dog he will feed on roots and other vegetable substances; but this is only in cases of extreme necessity: he is also known to eat crabs, shrimps, or other shell-fish.

The fox sometimes runs down his prey, and at others he slips cautiously forward, like a cat, dragging his body on the ground, and then makes a sudden bound at his booty, seldom missing his aim. He either conceals it among bushes or herbage, or carries it off to his burrow. In this manner, he returns repeatedly to his work of destruction, and generally keeps a considerable supply of provisions in store, but always in different places, to serve him under his various necessities; but it is seldom he prolongs these excursions after sunrise.

Fox-hunting has long been a favourite British field-sport, and in no other country is it pursued with such ardour and intrepidity. Both our dogs and horses are bred with particular care for this pastime, and are justly prized by all neighbouring states. The instant the fox finds himself pursued, he makes for his hole; but when it is intended to hunt a district, the huntsman or earth-stopper takes care to fill up the entrance to his burrow when he is out in search of food, so that he can only have recourse to his speed and cunning for his safety. He does not double, like the hare, but takes a straightforward course with strength and perseverance, and sometimes leads his pursuers a distance of fifty miles at a stretch, without the smallest intermission. Both dogs and horses, particularly the latter, frequently fall victims in such arduous chases. His strength is so great that he frequently escapes the utmost efforts of his enemies to take him, and returns to his hole in safety. But when all shifts have failed him, and he is at last overtaken, he defends himself with great obstinacy, and silently fights till he is literally torn to pieces by the merciless dogs.

On the 28th of October 1815, the hounds belonging to the Newry hunt started a fox at Tamary. After a short chase, reynard disappeared, having cunningly mounted a turfstack, on the top of which he lay down flat. Finding himself at last perceived by one of the hounds, he left his retreat, closely pursued by the pack. Being again hard pressed, he ran up a stone ditch, from which he sprang on the roof of an adjoining cabin, and mounted up to the chimney top. From that elevated situation he looked all around him, as if carefully reconnoitring the coming enemy. A cunning old hound approached, and, having gained the summit of the roof, had already seized the fox in imagination, when, lo! reynard dropped down the chimney, like a fallen star into a draw well. The dog looked wistfully down the dark opening, but dared not pursue the fugitive. Meantime, whilst the hound was eagerly inspecting the smoky orifice of the chimney, reynard, half enrobed in soot, had fallen into the lap of an old woman, who, surrounded by a number of children, was gravely smoking her pipe, not at all expecting the entrance of this abrupt visitor. "Emiladh deouil!" said the affrighted female, as she threw from her the black-red quadruped. Reynard grinned.

growled, and showed his fangs; and when the sportsmen, who had secured the door, entered, they found him in possession of the kitchen, the old woman and the children having retired, in terror of the invader, to an obscure corner of the room. The fox was taken alive, by William Gordon of Sheepbridge, Esq.

Some years ago, in Dumfriesshire, a fox was fairly hallooed from a hiding-place, amidst a ledge of rocks, high, secluded, and inaccessible, yet withal conveniently enough situated for those nightly forays by which he had laid half the hen-roosts in the district under repeated contribution. As the hounds were at hand, the felon bounded away through brush and brake, distancing his pursuers in the first instance, and holding out the promise of an excellent day's sport. These exertions, however, were too violent to be long continued, and the hunters knew, from the increased yelling of the pack, that it was gaining upon the enemy every moment. At this juncture, a gentleman who rode foremost in the chase observed the animal pause, look round, and then bound away, apparently with fresh vigour and greatly increased speed. Attracted by this circumstance, he rode up to the spot, and there found a very young cub, which the affectionate mother had carried at least two miles in her teeth, and which she did not abandon till the very last extremity. Situated as they were, the party had no means of restoring the cub, but as a reward for the fidelity of the mother, the whipper-in was immediately ordered to call off the dogs, and recommence the sports of the day in a totally different quarter.

The fox generally brings forth from three to six at a litter, and only once a-year. They are blind, and of a dark-reddish brown. They do not reach their full size till eighteen months old, and live to the age of from fourteen to sixteen years.

Sir Walter Scott, in his "Picturesque Scenery and Antiquities of Scotland," relates a curious anecdote of a fox-hunt, in which he was himself concerned. The hounds, which belonged to the Duke of Buccleuch, had had a long chase, and at last the fox made for Crichton Castle, and, leaping in at a window, endeavoured to find refuge in some of the *holes* or *bores* of that vast ruin. The hounds followed him, however, and soon compelled him to take his departure by a channel similar to that by which he had entered. It was then, Sir Walter informs us, one of the most singular and striking sights he ever witnessed, to see the long stream of dogs pouring out of a high window upon the ground, as if it were a cascade of animated creatures, variegated by numerous colours.

In the autumn of the year 1819, at a fox-chase in Galloway, a very strong one was hard run by the hounds, and finding himself in danger of being overtaken, made for a high wall at a short distance, and springing over it, crept close under the other side; the hounds followed him, but no sooner had they leapt the wall, than he again sprang over it, and, by this cunning device, gave them the slip, and got safe away from his pursuers.

Mr Hawkins of Pittsfield, an American gentleman, was in pursuit of foxes, accompanied by two bloodhounds; the dogs soon found a fox, and pursued him for nearly two hours, when suddenly they appeared at fault. Mr Hawkins came up with them near a large log of wood lying on the ground, and felt much surprised at seeing them take a circuit of a few roods without having an object in view, every trace of reynard seeming to have been lost, while they still kept yelping. On looking about him, he discovered the sly fox stretched upon the log apparently lifeless. Mr Hawkins made several unsuccessful efforts to direct the attention of the dogs towards the fox. At length he approached so near the artful object of his pursuit as to see him distinctly breathe. Even then reynard exhibited no alarm, and Mr Hawkins seizing a branch of a tree that lay hard by, aimed a blow at him, which the fox evaded by a leap from his singular lurking place, having thus for a time effectually deceived his pursuers, and got clear off.

When the old Duke of Grafton had his hounds at Croydon, it was his custom to have foxes taken occasionally in Whittlebury forest, and sent up in the venison cart to London. The fox thus brought was carried down the next hunting morning in a hamper behind the duke's coach, and turned out for the sport of the day. In pursuance of this plan, a fox was taken in a coppice in the forest, and sent up as usual. After a certain time, a fox was taken in the same coppice, whose size and appearance was so strikingly like that caught on the same spot before, that the keepers employed on the occasion expressed their suspicion that it was the same fox; and the man whose office it was to go to London with the venison, was directed to inquire whether the fox hunted on such a day was killed, or escaped. The latter having been the case, the suspicion of the keepers was at least considerably strengthened.

After a short time, a fox was again taken in the same coppice, which those concerned in taking it were well assured to be the same as was caught there before. To be, however, better able to identify their supposed old friend, if another opportunity should offer, before sending him off the third time he was marked in several places, and in different manners, his lip being cut, one ear slit, and several holes punched through the other. Thus marked, reynard was again dispatched to London, again hunted, and again escaped, and, within a very few weeks, was again taken in the same coppice, when his marks justified their former conjectures in spite of the seeming improbability of the fact. This poor animal was destined once more to put his strength and sagacity to the test, when the one or the other failed him, and he was caught by the hounds after a good chase, bearing the marks of his former escapes, which ought to have entitled him to the privilege formerly granted to a stag who had been fortunate enough to escape from his royal pursuers.

The following singular occurrence took place in the end of May 1829. As the forester on the estate of Auchenreoch, parish of Campsie, Ayrshire, proceeded to a field about seven in the morning, he was unexpectedly saluted by the howling of two full-grown foxes, which obstructed him in his course with so determined a resistance, that he was glad to call another man to his aid before he could drive them off. On proceeding a short way, a third fox was discovered hanging from a young ash tree, about three feet from the ground, with its shoulders firmly wedged between the forked branches. So hard had reynard struggled for liberty, that one of its fore-legs was broken; they succeeded, however, in taking it alive.

PHYSICIANS.

Sir William Temple relates the following anecdote of Dr Rujean, the most celebrated man of the medical profession in his time:—A certain great lady came to him in much distress about her daughter, and the physician began the investigation of the case by asking, "Why, what ails she?" "Alas! doctor," replied the mother, "I cannot tell; but she has lost her humour, her looks, her stomach—her strength consumes every day, so as we fear she cannot live." "Why do you not marry her?" "Alas, doctor, that we would fain do, and have offered her as good a match as ever she could expect." "Is there no other that you think she would be content to marry?" "Ah, doctor, that is it that troubles us; for there is a young gentleman we doubt she loves, that her father and I can never consent to." "Why, look you, madam," replied the doctor, gravely, being among all his books in his closet, "then the case is this: your daughter would marry one man, and you would have her marry another. In all my books I find no remedy for such a disease as this."

This story is an apposite illustration of the preposterous circumstances under which some people expect to derive benefit from medicine; but it is not often that they have the candour to explain the real state of the case. Many have a delicate tenderness for their own feelings, which withholds all information that might assist the physician in detecting the origin and nature of their disease; while, at the same time, they are so unreasonable, and have so little consideration, not only for the feelings but for the character of another, that they expect he will not misapprehend a single symptom, and exclaim vehemently against him if his treatment do not prove successful. Yet, where maladies depend upon the passions and affections so much as they must always do in a highly cultivated state of society, it is impossible to remove them, unless, besides the present bodily sensations, a faithful account be also rendered of the incidents in the patient's history which first disturbed the tranquillity of his mind, and thereby disordered the functions of his body. It is true that such communications would lead to a disclosure of family and personal secrets almost as unreserved as was formerly exacted at the confessional; it cannot, therefore, be expected that they should be made to any great extent; but people should at least learn not to be disappointed, and not to be angry because a cure is not performed, when they have themselves prevented it by concealing particulars that the medical attendant ought to have been made aware of.

But it is not in this way alone that unmerited censures are heaped upon the professors of the healing art. Such is our love of life, that we can scarcely ever persuade ourselves that any illness is our last; and when a friend is cut off, we are apt to imagine that a more skilful treatment might have saved him. Those, in particular, who belong to the lower classes, seldom see a young person, whose loss they regret, carried to the grave without remarking, that some old woman or other, experienced among sick-beds, "didna think the doctor ever rightly took up (comprehended) his trouble." Undoubtedly this is sometimes the case; both because many diseases are too complicated to be thoroughly understood, and because some practitioners are not so well informed nor so careful as they ought to be; but the allegation is made nine times wrongously to one where it is just.

Physicians receive very unfair play from another class of persons who call in their aid, and expect to be benefited by it instantaneously, at the same time that they by no means follow the injunctions laid down for their observance. A prescription is left; but the patient, felicitating himself upon his own sagacity, disregards it. The next day he does not hesitate to assert that the drug was duly taken: another medicine is ordered; and for once he makes himself a "good child," and allows it to be administered; but the efficacy of the second depending upon the previous operation of the first, and the first never having been used at all, the system, instead of being set to rights, suffers of course a farther derangement—a deterioration which is unscrupulously attributed to the doctor's ignorant treatment of the disorder. It never for a moment enters the patient's head that this treatment is not the doctor's, whose orders were disobeyed at the very outset; on the contrary, he observes to all who visit him, how fortunate a circumstance it was that he threw the first prescription aside, else matters might have been as bad again with him! We know an honest woman in the country, who, during a long illness, was attended by a regular practitioner, whose advice she sometimes followed and sometimes not, just as her caprice happened to suggest; but all the time she assiduously swallowed the doses of a certain celebrated empiric. If she enjoyed a day of ease, the quack was sure to get the credit of it: "it was untelling," she said, "the good she had gotten of his pills." Her intervals of suffering were with equal confidence ascribed to the mismanagement of the physician.

It is no wonder if medical men, not suspecting such gross deceptions in their patients, and seeing their prescriptions produce, as they are led to suppose, effects so different from what they have always seen them do in similar cases, begin to think they have mistaken the nature of the disease, and modify their treatment according to the misrepresentations of their employer. The consequence is, that no satisfactory result is obtained; the sick person, peevish and discontented, lays the whole blame on the doctor, whom he has from the beginning made it his business to mislead; calls in, in succession, four or five more, whom he deludes and discharges in the same manner; and ultimately, as the proper punishment for such a train of disingenuous proceedings, falls into the hands of a quack, who protests there never was such a set of impostors as the regular members of the medical faculty, declares that he will accomplish a cure in a month—he could have done it in a few days but for previous mismanagement—and, to use a vulgar phrase, "does for him" in considerably less than that time. The relatives take the tone of their opinion from the unwarranted assertions of this interloper, and the remark flies about—"Poor man! he was killed by the doctors. The man he at last consulted had some skill, and did a little for his relief; but he was ower far gane afore—clean wasted away wi' the drugs he had swallowed."

It is in China, we believe, where physicians are not paid unless they effect a cure, and this fact is often quoted by unthinking persons, with the comment that it would be well if the same practice were introduced into this country. But though a disease be not overcome, the sufferings it occasions may often be greatly lightened, and it would certainly be cruel in the extreme to deny to a man, of whom it is certainly known that his last hour is at hand, that alleviation of his expiring pangs which the use of medicine may procure. The doctor, after seeing that a case was hopeless, could have no motive to remain any longer by the sick-bed, unless humanity prompted him to do so; and if the friends of the sufferer would not part with a few shillings to obtain this kindness for him, it is not to be thought that strangers would often voluntarily stay to perform it. Yet the statement we have alluded to, passing from mouth to mouth, fills the auditors with a high idea of the shrewdness of the people among whom the custom is found, while at the same time they feel as if their own intellect were of an inferior order. We hope enough has been said to convince every one who reads it that there is no occasion here for any such mean opinion of ourselves, but that, on the contrary, the advantage is wholly on our side.

The above remarks have been thrown together principally for the use of our readers in the humbler walks of life, who, whatever may be their merits in other respects, are frequently—we had almost said habitually—too harsh in the construction they put upon the conduct of their medical advisers—a class of men whose daily and nightly task it is to visit the house of mourning, and whose lives are spent in alleviating the sufferings of their fellow-creatures. If we were asked to name any profession, the members of which performed their duties in a more faithful and conscientious manner, we could not do it; and if it were inquired which of all classes of men, as a class, performs the greatest number of benevolent actions, and does most, gratuitously, to lighten the general burden of human misery, we would answer—the Physicians.

REMARKABLE TRAVELS IN UNCIVILISED COUNTRIES.

CARVER, IN NORTH AMERICA.

(Second Article.)

A MULTITUDE of theories have been started by different authors, to account for the origin of the native population of America, prior to its discovery by Europeans. By far the most plausible theory, certainly, is that which is adopted by Captain Carver, that the progenitors of these people, most probably, found their way originally into America from *Chinese Tartary*, by the way of Kamschatka; and, in accordance with this idea, some authors have denominated the Peruvians the *Chinese of America*. "It appears plain to me," says our author, "that a great similarity between the Indians and Chinese is conspicuous in that particular custom of shaving or plucking off the hair, and leaving only a small tuft on the crown of the head. This mode is said to have been enjoined by the Tartarian emperors on their accession to the throne of China, and, consequently, is a farther proof that this custom was in use among the Tartars, to whom, as well as the Chinese, the Americans might be indebted for it. Many words also are used both by the Chinese and Indians, which have a resemblance to each other, not only in their sound, but their signification. There might possibly be found a similar connection between the language of the Tartars and the American aborigines, were we as well acquainted with it, as we are, from a commercial intercourse, with that of the Chinese."

The above theory has been completely followed out, on the principles here stated, by the celebrated Humboldt, and published by him, some years ago, in his "Researches in America." In that work he observes as follows:—"The nations of America, except those which border on the polar circle, form a single race, characterised by the formation of the skull, the colour of the skin, the extreme thinness of the beard, the straight and glossy hair. The American race has a striking resemblance to that of the *Mongul* nations, which include those known formerly by the name of Huns, Kulans, and Kalmucks."

Owing to various causes, the Indian population of North America could never be very great, and ever since the commencement of their intercourse with Europeans, it has regularly and rapidly decreased. The Red Men at present within the bounds of the United States are stated to be about 120,000. Of these, 20,000 belong to the only five nations that are recognised as such, eastward of the Mississippi. The Chickasaws, a people of about 4000, which have been lately bargained off to the west of the Mississippi, are said to have increased ten per cent. in six years. It is very probable that in the course of another century at farthest, the whole progeny of the primitive occupants of the North American continents will be driven into the Pacific Ocean, or quietly absorbed by the flood of civilised population which is spreading, in every direction, so rapidly around them. This was remarked by Justamond, a French writer, more than sixty years ago. "When we consider the hatred," says he, "which the hordes of these savages bear to each other, the hardships they undergo, the scarcity they are often exposed to, the frequency of their wars, the scantiness of their population, the numberless snares we lay for them, we cannot but foresee, that, in less than three centuries, the whole race will be extinct. What will posterity then think of this species of men, who will exist no more but in the accounts of travellers? Will not the times of savages appear to them in the same light as the fabulous times of antiquity do to us? They will speak of them as we do of the Centaurs and Lapithæ. How many contradictions shall we not discover in their customs and manners! Will not such of our writings as may then have escaped the destructive hand of time, pass for romantic inventions, like those which Plato has left us concerning the ancient Atalantis?"*

The stature of these people is described as being, in general, beautifully proportioned; but they had more agility than strength, and were better calculated for swiftness than hard labour; and hence their bitterest imprecation against an enemy was, that he might be reduced to till the ground. Their features were regular, with that fierce aspect which they contracted in war and hunting. Their complexion was copper-colour, and they had it from nature, as all men become tawny when they are constantly exposed to the open air. This complexion was rendered still more disagreeable by the absurd custom which all savages have of painting their bodies and faces, either to distinguish each other at a distance, or to make themselves more agreeable to their mistresses, or more formidable in war. Besides this varnish, they rubbed themselves with the fat of quadrupeds, or the oil of fishes, which prevented the intolerable stings of gnats and other insects that swarm in uncultivated countries. These ointments were prepared and mixed up with certain red juices, which were supposed to be a deadly poison to the mosquitoes. To these several methods of anointing themselves, which penetrate and discolour the skin, may be added the fumigations they made in their huts to keep off those insects, and the smoke of the fires they kept up all the winter, to warm themselves and to dry their meat. This was sufficient to make them appear frightful to our people, though they undoubtedly imagined that it added to their beauty. Their sight, smell, hearing, and all their senses, were remarkably quick, and gave them early notice of their dangers and wants. These were few, but their diseases were fewer. They hardly knew any distempers but what were occasioned by too violent exercise, or eating too much after long abstinence.

The extreme ferocity manifested by these tribes, in the killing of their enemies, by scalping them and sucking their blood, as also their fiendish manner of torturing their prisoners to death, whilst the said prisoners seem to have possessed the power of almost entirely repressing the feeling of pain under the hands of their tormentors, are circumstances which have often been detailed, and, therefore, a description of such matters at present would have little of novelty to recommend it. "This method of tormenting their enemies," says our author, "is considered by the Indians as productive of more than one beneficial consequence. It satiates, in a greater degree, that diabolical lust of revenge which is the predominant passion in the breast of every individual of every tribe, and it gives the growing warriors an early propensity to that cruelty and thirst for blood which is so necessary a qualification for such as would be thoroughly skilled in their savage art of war.

"I have been informed that an Indian who was under the hands of his tormentors, had the audacity to tell them that they were ignorant old women, and did not know how to put brave prisoners to death. He acquainted them that he had heretofore taken some of their warriors, and, instead of the trivial punishments they inflicted on him, he had devised for them the most excruciating torments; that, having bound them to a stake, he had stuck their bodies full of sharp splinters of turpentine wood, to which he then set fire, and, dancing around them, enjoyed the agonizing pangs of the flaming victims. This bravado, which carried with it a degree of insult that even the accustomed ear of an Indian could not listen to unmoved, threw his tormentors off their guard, and shortened the duration of his torments; for one of the chiefs ran to him, and, ripping out his heart, stopped with it the mouth from which had issued such provoking language."

If any of the men-prisoners are spared, which is often the case, by their being adopted into the tribe, they are commonly given to the widows that have lost their husbands by the hand of the enemy, if there be any such, to whom, if they happen to prove agreeable, they are soon married. But should the dame be otherwise engaged, the life of him who falls to her lot is in great danger, especially if she fancies that her late husband wants a slave in the country of spirits, to which he is gone.

A tall handsome prisoner had lost several of his fingers in battle. This circumstance was not noticed at first. "Friend," said the widow to whom he was allotted, "we had chosen thee to live with us; but in the condition I see thee, unable to fight and to defend us, of what use is life to thee? Death is certainly preferable." "I believe it is," answered the savage. "Well, then," replied the woman, "this evening thou shalt be tied to the stake. For thy own glory, and for the honour of our family, who have adopted thee, remember to behave as a man of courage." He promised he would, and kept his word. For three days he endured the most cruel torments with a constancy and cheerfulness that set them all at defiance. His new family never forsook him, but encouraged him by their applause, and supplied him with drink and tobacco in the midst of his sufferings!

"How shall we account for this insensibility?" says Justamond. "Is it owing to the climate, or to their manner of life? No doubt, colder blood, thicker humours, a constitution rendered more phlegmatic by the dampness of the air and the ground, may blunt the irritability of the nervous system in Canada. Men who are constantly exposed to all the inclemencies of the weather, the fatigues of hunting, and the perils of war, contract such a rigidity of the fibres, such a habit of suffering, as makes them insensible to pain. It is said, the savages are scarce ever convulsed in the agonies of death, whether they die of sickness or of a wound. As they have no apprehensions either of the approaches or the consequences of death, their imagination does not suggest that artificial sensibility against which nature has fortified them. Their whole life, both natural and moral, is calculated to inspire them with a contempt of death, which we so much dread, and to enable them to overcome the sense of pain, which is heightened by our indulgences."

The Indians, as might be supposed, were never great adepts in astronomy, but, as Carver informs us, they seem nevertheless to have had a very rational method of dividing their time. They count their years by winters, or, as they express themselves, by snows. They generally divide their years by moons, and make them consist of twelve lunar months, observing, when thirty moons have waned, to add a supernumerary one, which they term the lost moon; and they then begin to count as before. They pay a great regard to the first appearance of every moon, and, on the occasion, always repeat some joyful sounds, stretching at the same time their hands towards it.

Every month has with them a name expressive of its season; for instance, they call the month of March (in which they generally commence their year at the first new moon after the vernal equinox) the worm month, or moon, because at this time the worms quit their retreats in the bark of the trees, wood, &c., where they have sheltered themselves during the winter.

The month of April is termed by them the month of plants; May, the month of flowers; June, the hot moon; July, the buck moon. The reason for thus denominating these is obvious.

August, the sturgeon moon; because in this month they catch great numbers of that fish.

September, the corn moon; because in that month they gather in the Indian corn, which is their only agricultural produce, and even that is managed chiefly by the women.

October, the travelling moon; as at this time they leave their villages, and travel towards the places where they intend to hunt during the winter.

November, the beaver moon; for in this month the beavers begin to take shelter in their houses, having laid up a sufficient store of provisions for the winter season.

December, the hunting moon; because they employ this month in pursuit of their game.

January, the cold moon; as it generally freezes harder, and the cold is more intense in this than in any other month.

February, they call the snow moon; because more snow commonly falls during this month than any other throughout the winter.

When the moon does not shine, they say she is dead, and some call the three last days of it the naked days. The moon's first appearance they term its coming to life again. They have no such division as that of weeks; but days they count by *sleeps*, half days by pointing to the sun at noon, and quarters by the rising and setting of the sun, to express which in their traditions they make use of very significant hieroglyphics.

In regard to arithmetic, their ideas are extremely circumscribed; and though they are able to count, in general, as high as thousands, figures, as well as letters, appear mysterious to them, and quite above their comprehension.

"During my abode with the Naudowessies," says our author, "some of the chiefs, observing one day a draught of an eclipse of the moon in a book of astronomy which I held in my hand, they desired I would permit them to look at it. Happening to give them the book shut, they began to count the leaves till they came to the place in which the plate was. After they had viewed it, and asked many questions relative to it, I told them they need not to have taken so much pains to find the leaf on which it was drawn, for I could not only tell in an instant the place, without counting the leaves, but also how many preceded it. They seemed greatly amazed at my assertion, and begged that I would demonstrate to them the possibility of doing it. To this purpose I desired the chief that held the book to open it at any particular place, and just showing me the page, carefully to conceal the edges of the leaves, so that I might not be able to count them. This he did with the greatest caution; notwithstanding which, by looking at the folio, I told him, to his great surprise, the number of leaves. He counted them regularly over, and discovered that I was exact. And when, after repeated trials, the Indians found I could do it with great readiness, and without ever erring in my calculation, they all seemed as much astonished as if I had raised the dead. The only way they could account for my knowledge was by concluding that the book was a spirit, and whispered me answers to whatever I demanded of it. This circumstance," adds the captain, "trifling as it might appear to those who are less illiterate, contributed to increase my consequence, and to augment the favourable opinion they already entertained of me."

These Indian tribes used to go annually, in the month of April, to a great cave situated about thirty miles below the Falls of St Anthony, on the Mississippi, where, a grand council being held with the other tribes, they settled their operations for the ensuing year. At the same time they carried with them their dead, for interment, bound up in buffaloes' skins. On one of these occasions Captain Carver formed one of the company. When they arrived at the great cave, and the Indians had deposited the remains of their deceased friends in the burial-place that stands adjacent to it, they held their great council, at which a great number of speeches were delivered on both sides, the fluency of which would astonish an European.

THE CANONGATE OF EDINBURGH.

[From "Reekiana," a work by R. Chambers, just published.]

The Canongate, which takes its name from the Augustine Canons of Holyrood (who were permitted to build it by the charter of David the First in 1128, and afterwards ruled it as a burgh of regality), was formerly the court end of the town. As the main avenue from the palace into the city, it has borne upon its pavement the burden of all that was beautiful, all that was gallant, all that has become historically interesting in Scotland for the last six or seven hundred years. It still bears an antique appearance, although many of the houses are modernised. There is one with a date from Queen Mary's reign,* and many may be guessed from their appearance to be of even an earlier era. Previous to the Union, when the palace ceased to be occasionally inhabited, as it had formerly been, by at least the vicar of majesty, in the person of the Lord High Commissioner to the Parliament, the place was densely inhabited by persons of the first distinction. Allan Ramsay, in lamenting the death of Lucky Wood, says—

Oh, Canigate, puir elrich hole,
What loss, what crosses does thou thole!
London and death gars thee look droll,
And hing thy head;
Wow but thou has e'en a cauld coal,
To blaw indeed—

and mentions, in a note, that this place was "the greatest sufferer by the loss of our members of Parliament, which London now enjoys, many of them having had their houses there"—a fact which Maitland confirms. Innumerable traces are to be found in old songs and ballads, of the elegant population of the Canongate in a former day. In the pitiable tale of Marie Hamilton—one of the queen's Maries—occurs this simple but picturesque stanza:—

As she cam doun the Cannogait,
The Cannogait sae free,
Mony a lady looked ower her window,
Weeping for this ladye.

An old popular rhyme expresses the hauteur of these Canongate dames towards their city neighbours of the male sex:—

The lasses o' the Canongate,
Oh, they are wond'rous nice;
They winna gie a single kiss,
But for a double price.
Gar hang them, gar hang them,
Hich upon a tree;
For we'll get better up the gate,
For a bawbee!

But even in times comparatively modern, this faux-bourg was inhabited by persons of very great consideration. Within the memory of a lady in middle life, it used to be a common thing to hear, among other matters of gossip, "*that there was to be a braw flitting*† *in the Canongate to-morrow;*" and parties of young people were made up, to go and see the fine furniture brought out, sitting perhaps for hours in the windows of some friend on the opposite side of the street, while cart after cart was laden with magnificence. Many of the houses, to this day, are fit for the residence of a first-rate family in every respect but *vicinage* and *access*. The last grand blow was given to the place by the opening of the road along the Calton Hill in 1817, which rendered it no longer the avenue of approach to the city from the east. Instead of profiting by the comparative retirement which it acquired on that occasion, it seemed to become the more wretchedly squalid, from its being the less under notice—as a gentleman dresses the least carefully when not expecting visitors. It is now a secluded, and, in general, meanly inhabited suburb, only accessible by ways, which, however lightly our fathers and grandfathers might regard them, are hardly now pervious to a lady or gentleman, without shocking more of the senses than one, besides the difficulty of steering one's way through the herds of the idle and the wretched who encumber the street. The only decent approach is, indeed, by that very new road, along the Calton Hill, which has operated so grievously to the depression of this antique place. There is now (1833) only one person of condition in the whole street, Sir William Macleod Bannatye (formerly a Judge of the Supreme Court, under the designation of Lord Bannatyne), who occupies a tall and elegant mansion on the site of the house of the Earls of Wintoun, built by the late Sir John Whiteford, and afterwards occupied by Professor Dugald Stewart.

* A little below the church.

† Removal.

THE HARE A NATURAL PHILOSOPHER.

Coursing owes all its interest to the instinctive consciousness of the nature of inertia which seems to govern the measures of the hare. The greyhound is a comparatively heavy body, moving at the same or greater speed in pursuit. The hare *doubles*, that is, suddenly changes the direction of her course, and turns back at an oblique angle with the direction in which she had been running. The greyhound, unable to resist the tendency of its body to persevere in the rapid motion it had acquired, is urged many yards before it is able to check its speed and return to the pursuit. Meanwhile the hare is gaining ground in the other direction, so that the animals are at a very considerable distance asunder when the pursuit is recommenced. In this way, a hare, though much less fleet than a greyhound, will often escape it.—*Cabinet Cyclopædia.*

REMINISCENCES OF AN OLD OFFICER.

THE LOOTIES WORSTED.

Captain John Grant, senior, 2d battalion 42d regiment (of Glenmorrison, Inverness-shire), was second in command in the fort of Mangalore when besieged by Tippoo, in the early part of which he commanded a sortie or sally against the enemy's grand battery, and of another of four guns near it, of which he obtained possession; but the enemy collecting in great force, and finding their works of extraordinary thickness and strength, he deemed it prudent and necessary to return to the fort, without having completed his object, to which his detachment, as it turned out, was by no means adequate. His conduct was approved of: he was a gallant soldier, and an excellent good-tempered man.

In the year 1782, when the force under Lieutenant-Colonel Humberston was moving against Tippoo's fort of Paligautcherry, Captain Grant was principally concerned in a little adventure, which might have terminated very disagreeably, but from which he and his small party extricated themselves with great presence of mind, coolness, and gallantry, which did them much credit. He, Lieutenant Charles Sutherland, Serjeant Cummings, Corporal Munro, and a private whose name is not remembered, went out on a party from camp to shoot bullocks, a very common practice, the commissary not having it in his power to procure them regularly for the army. Just as the party had ascended a little hill, they saw advancing towards them a party of the enemy's irregular horse (termed looties), of about twenty in number, and brandishing their drawn swords. Captain Grant's party immediately formed, determined to sell their lives dearly; and he gave orders that one-half should only fire at a time, and that the other half should reserve theirs until those who had fired had again loaded. The whole party were armed. Their first fire brought down some of the horses and horsemen, which checked them; they again attempted to advance: the next fire produced a similar effect as the first, which so staggered them, that, after a little debate amongst themselves, they thought it best to abandon the enterprise, which they found more dangerous and disadvantageous than they had expected. In Tippoo's irregular cavalry, the horses were the property of the riders, the loss of which he did not replace to the owners, which will account for their not persevering in their attack on Captain Grant and his brave little party. The Malabar coast had been ruled by Hindoo rajahs, whom Hyder, Tippoo's father, had subjected, and tried to convert to the Mahommedan religion; the consequence of which was, that the inhabitants had forsaken the open country, and had retired to the fortresses and hills; and many of the cattle had been permitted to run wild, and had greatly increased.

A LANDSMAN TURNED NAVIGATOR.

Captain Dalyell, 2d battalion 42d regiment (of Largo, Fifeshire), was a man of talent and science; he was killed at Mangalore, and had been previously wounded at Paniera, when Tippoo attacked the force under the command of Lieutenant-Colonel Macleod. The colonel employed Captain Dalyell as chief engineer in erecting the field-works to strengthen his post, for which his education had qualified him.

The Myrtle transport, on board of which were the companies of Lieutenant-Colonel Macleod, Captain Macdonell, and Captain Dalyell, 2d battalion 42d regiment, unfortunately separated from the fleet off the Cape of Good Hope; they put into St Augustine's Bay, in Madagascar, the rendezvous. It was in a great measure owing to him that from this they shaped their course for St Helena, as his science enabled him to make the necessary observations, the captain being only a seaman, and no navigator. They had no charts on board, unless the maps in Guthrie's Gazetteer could be so called. At St Helena, they procured proper charts, from whence they made their way good to Madras, where they appeared long after they had been totally given up for lost.

EPIDEMIC.

In the year 1782, a most violent cramp, or a spasmodic affection, was so prevalent and severe, both amongst the Europeans of the troops on the Malabar coast, and amongst the seamen in Sir Edward Hughes' fleet, that it may be said to have been epidemic. It generally first attacked the lower extremities, but soon mounted to the vital parts, and proved mortal if not subdued and overcome by friction, the warm bath, and by the free use of opium and mulled spirits. On board the fleet, their coppers were always left full of boiling water, that they might immediately command the warm bath. It was a most fearful disease, and most distressing to witness the agonies of those suffering under it. We believe it had no connection with the cholera, and amongst the troops it was more prevalent during the monsoon, or rainy season.

TOUR OF DUTY.

On the evening of the 16th or 17th of October 1782, Lieutenant S——, of the 2d battalion 42d regiment, according to the rules which then existed in favour of the king's service, being senior subaltern in the little army under the command of Lieutenant-Colonel Humberston, proceeding against Paligautcherry, and being first on the list for that kind of duty, was ordered on detachment from Margaree Catah, in Ramgaree, a distance of about thirty miles, for a supply of ammunition, which was much wanted; and leaving this, he marched next morning with the determination of only taking a sufficient time to allow his little party to cook and eat their rice at noon. His small party consisted only of twenty-five Travancore sepoys (the king of Travancore, our ally, had sent two of his battalions to reinforce us); but a jemautdaar of the Bombay troops (native lieutenant) accompanied him, to assist him, and to act as his interpreter—a very intelligent active little man, who had been repeatedly wounded in the service, to which he was faithfully and zealously attached. The lieutenant's friends, conceiving that the service he was sent on was one of much danger and uncertainty, took leave of him, evidently under the impression that they would not see him again, fearing his party would be intercepted and cut off by the enemy's cavalry. They were, however, mistaken. He met with no molestation, and successfully executed the duty with which he had been entrusted; for he rejoined the army with a loaded English waggon, a tumbril, and seventy boxes of ball-cartridges, carried on coolies' heads, and which they probably would have thrown down and fled had a single horseman appeared.

The English waggon (it had come out with the expedition under Commodore Johnston and General Meadows) was ill calculated for the kind of roads it had to travel through; and in lending his best exertions to assist it out of a rice field, the lieutenant lost his shoes, and was obliged to continue his march without any, and had it not in his power to replace them for eight or ten days after. Before he marched from Ramgaree, on his way back to the army, his party was reinforced by a havildar and twelve Bombay sepoys, and by eight or nine European soldiers who had been left there sick, had recovered, and had to join the corps to which they belonged.

FORTUNATE ESCAPE.

Early in the month of February 1783, Lieutenant S——, of the 2d battalion 42d regiment, then an assistant commissary of provisions, was ordered forward from Biddaral to Fatta Hettah with his stores, and with directions to have beef ready for the Europeans of the detachment under the command of Major Campbell, 2d battalion 42d regiment, then proceeding by orders from Brigadier-General Mathews against the fort of Arrantpore. Fatta Hetta was only a few miles distant from Biddaral, and as no enemy was suspected to be near, so no guard or escort had been sent with the commissary. Six bullocks were unpacked, his stores lodged, and his butchers had just begun their work, when a small party of Tippoo's looties, of about from fifteen to twenty, suddenly made their unwelcome appearance, galloping into the village with drawn swords, and shouting, with the evident intention of cutting down and making themselves masters of the commissariat. Thus taken by surprise, and without the means of defending themselves, all hands immediately dispersed; and in his speedy retreat the commissary having most fortunately fallen in with some few soldiers of his own corps, who had been permitted to march on in advance of Major Campbell's detachment, with them he immediately ran back with all the haste he could, drove the horsemen off, saved all his stores, and rescued a drummer boy of the 100th regiment, whom a lootie, after having severely wounded him with his sword, had made prisoner, and had mounted before him. This poor lad was afterwards taken prisoner at Biddaral, with General Mathew's army, and died in confinement.

CELEBRATED LIBRARIES.

BODLEIAN LIBRARY.

Before the beginning of the fourteenth century, the Oxford University Library consisted of a few tracts kept in the choir of St Mary's Church, and afterwards in the Old Convocation House, adjoining to the east end of that church.

The first collection of books in Oxford, worthy to be called a library, was left to Durham College, on the site of which Trinity College now stands, by Richard Augerville, Bishop of Durham, tutor to Edward the Third, and afterwards Treasurer and Chancellor of England. These books he had collected in his embassy to France, and they are supposed to have formed the largest collection at that time in England.

The divinity school, and the room above it, were built by Humphrey Duke of Gloucester. This room he furnished with books, to which those in the Old Convocation House were added. The commissioners of reformation, under Edward the Sixth, plundered this library so completely, that it was determined, in full convocation, in 1555, to sell the seats and cases.

About the end of Queen Elizabeth's reign, Sir Thomas Bodley, who died on the 28th of January 1612, built the gallery by which we enter the library, as well as that for pictures. The former he furnished with books, as well as the room over the divinity school, which he was at the expense of refitting for

that purpose. Besides giving his books, which he had collected with great care and expense, he left an estate for salaries to the officers, and to keep the library in repair. For the government of it he drew up some statutes, which were confirmed in convocation, and which are preserved in his own hand-writing in the archives of the library.

After the death of Sir Thomas Bodley, the Earl of Pembroke, by the persuasion of Archbishop Laud, gave to the library almost all the collection of Greek manuscripts which Francis Baroccio, the Venetian, had collected with great pains and cost, and which is thought to be the most valuable that ever came into England at one time. The earl reserved twenty-two of them for his own use; but these were afterwards bought and presented to the library by Oliver Cromwell; and to these Sir Thomas Roe, ambassador to Constantinople, added another choice collection of Greek manuscripts.

Sir Kenelm Digby having sent into the east to purchase oriental manuscripts, and into Germany to buy curious books, presented a large collection to the library, among which were upwards of two hundred manuscripts.

At the desire of Archbishop Laud, the University erected a room over the New Convocation House, and which, by communicating with Duke Humphrey's library (that is, the room over the divinity school), brought the library into the shape of a Roman H, which is its present form. In this part of the library the excellent collection of Archbishop Laud, and that of the learned John Selden, are placed.

Besides these benefactors, the library has been greatly increased by many others—the principal of which are General Fairfax; Dr Marshall, rector of Lincoln College; Dr Barlow, bishop of Lincoln; Dr Tanner, bishop of St Asaph; Dr Godwin, Dr Rawlinson, Browne Willis. Dr Rawlinson, besides his manuscripts, bequeathed his valuable collection of English coins, seals, &c. to the Bodleian library. Browne Willis, many years before his death, gave his collection of English coins, which he had been forty years collecting. The university being apprehensive that such a present might injure his family, paid him for 150 gold coins, at the rate of four guineas an ounce. He paid a visit to the cabinet every year on St Frideswide's day, and besides enlarging it, gave 1200 tradesmen's tokens, and several manuscripts, exclusive of his own, which he left by will to this library.

These donations, together with several libraries purchased by the University of Dr Huntington, Mr Greaves, Dr Pocock, and many others, and the publications which are added to it daily, have made it one of the largest libraries in Europe.

SELDEN'S LIBRARY ADDED TO THE BODLEIAN.

It appears that Selden had originally intended to leave his books to the Bodleian library, but, upon being refused the loan of some manuscripts from thence (the university acting agreeably to the statute, which expressly forbids any books to be carried out of the library), he altered his design, and left them to the Society of the Inner Temple, upon this condition, that they, together with the students of the Middle Temple, should erect a proper library for their reception; otherwise his executors were at liberty to bestow them upon any public body. The societies of the Temple rejecting the terms above mentioned, several members of the university, and particularly Mr Thomas Barlow, head librarian, entered into treaty with the executors, and stating the case properly, requested the books, which, upon certain terms, were granted to them. One of them is, that the "books bee forever heerafter kept togeather in one distincte pile and body, under the name of Mr Selden's Library."

In the beginning of September 1659, the library of the learned Selden was brought into that of Bodley. Anthony Wood laboured several weeks with Mr Thomas Barlow and others, in sorting them, carrying them up stairs, and placing them. In opening some of the books, they found several pairs of spectacles, which Mr Selden had put in, and forgotten to take out, and Mr Thomas Barlow gave Mr Wood a pair, which he kept in memory of Selden to his last day.

FOGS AND MISTS.

Fogs and mists, when they extend over large surfaces varied with land and water, are generally produced in fine calm weather, after the sun's rays have ceased to warm the earth by the higher masses of air, which have been rapidly cooled in the more elevated regions of the atmosphere, descending by their weight, and intermixing with the lower, and lighter, and still warmer strata. These are gradually chilled, until the undermost stratum is affected, first to dampness, then to a slight precipitation, scarcely visible to the eye, and, finally, to mist and fog. The earth, during clear nights, immediately on the withdrawing of the heat-imparting energies of the sun, begins to emit the particles of heat it had acquired during the day, or in ordinary language, to cool. The atmosphere does the same, but at a much slower rate. In the race, therefore, between the cooling powers of these two bodies, the start is usually made at sunset with the earth's surface warmer than the incumbent air. The first, by its more rapid descent, overtakes the latter at some point of equal temperature, and, passing its sluggish competitor, becomes colder, and, of course, instead of warming the stratum of air in contact, as it did in the first part of its course, it now, on the contrary, becomes an absorber of heat, and, consequently, cools the contiguous bodies. In both these cases, the process is favourable to the formation of mist, but in different modes. In the first, it assists the intermixture of the two differently warmed bodies of air, by keeping up the temperature of the lower one, and by thus increasing its disposition to ascend, the mingling and the deposition are more rapid and complete. In the latter case, it is in the same condition with relation to the air near the surface as the strata above it, namely, cooler, and, therefore, it acts similarly; the surface-air being now between two cooling masses, the rate of its condensation and consequent precipitation of moisture is at least continued, and perhaps increased.

The phenomenon of mists forming over lakes and rivers, when the atmosphere of their banks and adjacent land is entirely free from visible vapour, is a very remarkable one, and has excited considerable attention. The late Sir H. Davy observed and communicated to the public some curious facts, which have contributed very much to our knowledge on the subject. The principal operating cause in producing this singular effect is the difference of the rate of cooling, in the absence of the sun in fluid and in solid bodies. In the surface of the former, the particles, as they cool, sink, and give place to those beneath, which then are warmer, and therefore lighter, producing thus a renewal of surface, and a very slow decrease of its general temperature compared with those of solid bodies, whose particles are motionless among themselves. When those on their surface are cooled, they remain in their place, and are affected by the superior warmth of the internal particles only in the degree of the conducting power of the body. And this conducting power is found to be extremely feeble in most of the substances which form the solid crust of our globe.

These conditions being understood, it will be easy to imagine that the portion of the atmosphere which reposes on the surface of the water, will continue warmer after sunset on a clear night, than the contiguous parts which rest upon the adjacent land. From its position, too, with regard to an aqueous surface, it will also obtain a greater load of moisture. If we now suppose the cooled air of a superior stratum to descend in the usual manner upon the masses of air lying upon the earth and the water, which, though closely adjoining, are, with regard to heat and humidity, very differently compounded, we shall find that its descent might produce little or no visible change in the land stratum, while, by its superior weight, it would fall into and partially displace that over the water, intimately intermixing with it, and condensing its moisture, and thus creating in the air a visible river or lake of vapour, whose boundaries in a still night would exactly coincide with the banks of the water beneath, however irregular their outline. Mr Harvey observed a mist of this kind hovering in a beautiful stratum over the stream which supplies Plymouth with water. The mist moved in the direction of the running stream, but with a velocity much greater, while it accommodated itself, in a most singular manner, in its course, to all the turns and windings of the channel. The breadth of the mist was nearly the same as that of the stream, and its average altitude about five feet. The water of the stream was observed to stand at 56°; the air over the water, 47½°; the ground near the mist, 45°; the air above it, 49°.—*Companion to the Almanack.*

TURNING A CORNER—CENTRIFUGAL FORCE.

A carriage, or horseman, or pedestrian, passing a corner, moves in a curve, and suffers a centrifugal force, which increases with the velocity, and which impresses on the body a force directed from the corner. An animal causes its weight to resist this force, by voluntarily inclining its body towards the corner. As the velocity is increased, the centrifugal force is also increased, and therefore a greater inclination of the body is necessary to resist it. We accordingly find that the more rapidly a corner is turned, the more the animal inclines his body towards it. A carriage, however, not having voluntary motion, cannot make this compensation for the disturbing force which is called into existence by the gradual change of direction of the motion; consequently, it will, under certain circumstances, be overturned, falling of course outwards, or *from* the corner.—*Cabinet Cyclopædia.*

LIGHT.

It is become matter almost of certainty, that the sensation of light is produced in a suitable nervous tissue in the eye, by a trembling motion in another fluid than air, which fluid pervades all space, and in rarity or subtlety of nature surpasses air vastly more than air does water or solids; and while, in sound, different tones or notes depend on the *number* of vibrations in a given time, so in light do different colours depend on the *extent* of the single vibrations. Can human imagination picture to itself a simplicity more magnificent and fruitful of marvellous beauty and utility than this! But, farther: As air answers in the universe so many important purposes besides that of conveying sounds—although this alone comprehends language, which almost means reason and civilization—so also does the material of light minister in numerous ways, in the phenomena of heat, electricity, and magnetism.—*Dr Arnott's Elements of Physics.*

NATURAL WOODS OF SCOTLAND.

The trees which predominate in quantity are the common birch, the oak, the hazel, and the mountain ash. These generally grow intermingled; but in many places entire forests are seen composed of single species. Of the trees which thus occur, the birch is the most common, and next to it the oak. But the oaks of the Highlands bear no resemblance to those of England. Hardly a single tree ever presents itself of the diameter of a foot, which is also the case with the birch. In general, the birch occupies the sides of mountains, while the alder most invariably fringes the streams. The fir is seldom met with in its native state in the northern, or along the coasts of the middle division; but in the central districts of the latter there are still magnificent forests of it. On the shores of Loch Maree, in Ross-shire, the scenery of which is of the most sublime order, the scattered remains of an extensive forest of this tree are still to be seen, and in many other places it is to be met with in small patches; but whenever it was possible to render the woods subservient to the purposes of commerce, the Highland proprietors have not scrupled to strip their estates, and in this desolate condition have they generally left them. The ash, perhaps the most beautiful of our trees, is hardly a native; nor do we remember having met with it in any place where we could suppose it of spontaneous growth, excepting the upper end of Loch Awe, the entrance of Loch Carron, and the sides of Loch Katrine. Next to it in grace and beauty is the mountain ash, which is of frequent occurrence. Many of the Highland glens are decorated by the bird-cherry, a tree whose beautiful clusters of white drooping flowers form fitting companions to the harebell, which is so frequently seen in the wild glens of the western coasts. The holly is of rare occurrence. The ivy and the beech we have never met with, and require better proof of their being natives than the circumstance of their having found a place in our Floras. Besides the above trees may be mentioned many species of willow, few of which attain any magnitude:—the sloe tree, the wild cherry or gean, the hawthorn, the crab apple, and the white beam, together with the rare and beautiful dwarf birch, which occurs on some of the Highland mountains.—*Edinburgh Literary Gazette.*

PRESENT STATE OF SPAIN.

It is not customary to publish any account of the robberies which occur almost daily. But to show their frequency and the boldness with which they are undertaken, it is enough to mention, that the diligence from Madrid to Barcelona, though escorted by several soldiers, was robbed at least ten times in the course of last year. The mail-coach from Madrid to Bayonne met with the same treatment either four or five times; the robbery being in more than one instance accompanied by the death or wounding of the postilions. * * * The state of society in Spain is such as fortunately cannot be matched in any other country, not even in Portugal or Tipperary. That there should, in a population of only 14,000,000, be, in the course of a single year, 1223 murders, and 1773 attempts at murder, accompanied by stabbing and wounding, exhibits a ferocity on the part of the people, and an imbecility on the part of the government, without a parallel, we shall not say in the history of civilized nations, but even among savage hordes. The population of England and Wales differs very little from that of Spain; and during the years 1826 and 1827, there were 74 individuals, being at the rate of 37 each year, convicted of murder, and of attempts at murder by stabbing, shooting, poisoning, &c. Hence it results, that for every individual convicted of these crimes in this part of the British empire, there were eighty-one convicted in Spain! Such are the comparative fruits of good government and of tyranny and misrule. Surely if there be any truth in the remark of Hume, that, when human affairs are sunk to a point of depression, they naturally begin to ascend in an opposite direction, the regeneration of Spain cannot be far distant.—*Foreign Quarterly Review*, November 1829.

TO REMOVE A TIGHT STOPPER FROM A DECANTER.

It frequently happens that the stopper of a glass bottle or decanter becomes fixed in its place so firmly, that the exertion of force sufficient to withdraw it would endanger the vessel. In this case, if a cloth wetted with hot water be applied to the neck of the bottle, the glass will expand, and the neck will be enlarged, so as to allow the stopper to be easily withdrawn.—*Cabinet Cyclopædia.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place, and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

In DUBLIN, another Edition is published, with the permission of the Proprietors, by WILLIAM CURRY, Jun. and Company, Upper Sackville Street, for circulation throughout Ireland.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 81. SATURDAY, AUGUST 17, 1833. PRICE THREE HALFPENCE.

LONG LIVERS.

HUMAN life is not so short, but that very distant ages, or ages at least very different in character from each other, are sometimes strangely connected by the existence of an individual of the species. The progress of civilization, and the improvement of all the arts of life, is in this country so rapid, that no one who has survived to even middle life can fail to observe the great difference between his early and his latter days. How greatly, however, is the wonder increased, when we find persons who can look back for the better part, if not the whole of a century, and describe a state of things as having obtained in their young days, which is so entirely unlike any thing we now see around us, that it appears like a chapter of ancient history, narrated by an eye-witness who has, by some strange chance, survived the general wreck! At the present time, for instance, there must be individuals alive, who, in the midst of all the enlightenment, and all the conveniences, and appliances, for which the age takes so much credit—in this age of intellect, in short—recollect a time when there was *no intellect*, or at most *very little*, and when men of course lived a very strange sort of life. We are accustomed to regard the question of the Stuart dynasty as altogether a seventeenth century question—a thing quite foreign to our feelings and associations; yet people must still live, who not only recollect the pretensions of that family being defended by a respectable party, but saw a prince of the line invade the country, and, with a band of primitive people, who still kept alive manners, dress, and language, that had existed since before the days of the Romans, sweep through the island almost from end to end, in quest of the throne. We look upon Sir Robert Walpole as a man of quite a different day from this; and certainly one who was born in 1676, and suffered imprisonment in the Tower as an unruly member of Parliament in Queen Anne's time, is entitled to be so considered. Yet, if I am not mistaken, a daughter of his, Lady Katherine Walpole, appeared in our newspaper obituaries only about two years ago. Her father died in 1745. Our own present Duke of Montrose is but the grandson of a man who bore the family honours in the year 1684, before the death of King Charles the Second—nearly a hundred and fifty years ago—though it is curious, that, during the thirty-four preceding years, the same number of generations had borne them. What a difference between the circumstantial world of the grandfather and that of the grandson! Persons yet alive may recollect old Countess Margaret of Roxburghe, whose husband was drowned in the Gloucester frigate, coming down to Scotland with the Duke of York in 1682! She died so lately as 1753, a widow of seventy-one years. If I am not mistaken, Sir Ilay Campbell, who died in 1811, had conversed with an ancestor who had witnessed the execution of Charles the First: the space between the death of the monarch and that of the gentleman who had seen the witness of his execution, was a hundred and sixty-two years. Sir Walter Scott's mother, who died in 1820 or 1821, had spoken to a woman who recollected seeing Oliver Cromwell when in Scotland—or rather his nose, for she remembered nothing else about him. This was still more wonderful than the case of Sir Ilay Campbell, for the space between Cromwell's last departure from Scotland to fight the battle of Worcester in August 1651, and the death of the lady whose friend had seen him, was a hundred and seventy years! Such facts, though quite within the range of nature, and perhaps occurring not unfrequently, strike the mind with a kind of wonder—for they bring together into one idea, two ideas remotely different, and for a moment clasp the associations of a rude and unsettled age with those of one in every respect orderly and refined. It soothes us, moreover, with a pleasing notion of the extent of what we generally complain of as too short, namely, human life, and affords the encouraging idea that man or his immediate children may witness more of the effects of his own good works than is generally expected.

In the above instances, I have alluded to the phenomena which two long lives occasionally present. There are cases, however, in which one produces wonders almost as great. When George the Fourth visited Scotland, one of the individuals who came to bid him welcome and kiss his hand, was Patrick Grant, a Braemar Highlander, who had fought against his dynasty at Falkirk and Culloden, and been present at the melancholy embarkation of the defeated Chevalier for France. The old man remarked, with a tact worthy of a court, that he was perhaps the last of his majesty's enemies now alive. The king gave him a pension, which he enjoyed till his death, in February 1824, at the age of 111 years, when three pipers marshalled him to the grave, playing a tune which had been a favourite with his brethren insurgents in 1745. This civil war is still, on account of the curious contrast which it presents to the present state of things, a subject of constant allusion and recollection in Scotland. I may therefore refer to one or two other lives by which its wonders have been, as it were, brought into the presence of the existing generation. A venerable lady, Mrs K. of C., who died last year, and till her last displayed an almost juvenile vivacity and cheerfulness, remembered having been put into mourning for her cousin, a young gentleman of Prince Charles's army, who fell in the manner of the unfortunate Balmawhapple (though in no other respect did he resemble that personage), in the pursuit which followed the victory at Prestonpans. A distinguished exjudge of the Court of Session, who still lives in Edinburgh, is the *cousin-german* of one of the chieftains who led out their clans in that memorable year, and nephew to a gentlewoman who was seized and taken prisoner to London for having concealed the Chevalier. This individual entered the faculty of advocates in the year 1765, and may consequently be said to have been nearly seventy years connected with the court. There also lives at the present time in the New Town, a lady who recollects having been taken, when a child of about seven years, to see the Stuart court revived at Holyroodhouse: a Highland chieftain came out of the porch, and, with infantine wonderment at his appearance, she took hold of his kilt; her maid was astonished, when, instead of killing her with his dirk, he stooped down and clapped the child on the head. This lady remembers distinctly many of the Gaelic phrases used by the soldiers to each other on the streets of the city, and especially at the Netherbow Port, where they kept a guard. *Greshort*—make haste—was one of those most frequently in use, as might be expected from the hurried and adventurous nature of the whole affair. For some years past, many recently deceased Highlanders have been successively chronicled in the newspapers, as the last survivors of all who were engaged in that enterprise. Every forty-five hero who died, was naturally supposed by all who knew no other, to be almost for certain the last. The *last*, however, would appear to be still alive, if even he be alone in this curious historical distinction. The person I allude to is Andrew Wallace, who lives, or very lately lived, in Chester county, Pennsylvania, at the age of one hundred and three. He was born at Inverness in 1730, fought at the battle of Culloden on the side of Prince Charlie, and, in 1752, emigrated to America. He has since then fought in all the American wars, and was discharged so lately as 1813, after having been nearly seventy years a soldier. He enjoyed a pension of twenty-six cents per diem from the American government, and had a wife and two children, the youngest about fifteen years of age.

If we go back a few years, we find persons in extreme senility, whose association with proportionately earlier ages was equally remarkable. Dean Swift's curate died so late as 1797:* the dean himself had expired at a great age in 1744. The widow of the famous Lord Lovat (born in 1666, and executed in 1748) died in 1796, a hundred and thirty years after the birth of her husband. In March 1787, Torquil Macleod died in the Isle of Lewis, at one hundred and thirteen: he had been engaged in every battle fought for the house of Stuart since the Revolution, nearly a century before, namely, Killiecrankie, Sheriffmuir, and those of the Forty-five. If he had lived to July 1789, he would have survived his first battle a hundred years! Martha Hanna, however, who died so lately as 1805, remembered hearing the shots fired in one of the engagements during the residence of King James in Ireland—an incident nearly contemporaneous with the first battle fought by this aged islander. What an interval of improvement in every thing (at least for Britain) between the event which Martha recollected, and her death! Not many years ago, a woman, named Margaret Wylie, aged one hundred and thirteen years, was assisting at hay-making, in a field at Lawston, near Newcastleton, Roxburghshire, when it suddenly occurred to her that she had tedded hay in the very same place, when she was, as she expressed it, a gilpy lassie. On considering the matter farther, it turned out, to the astonishment of all present, that the old woman had been employed exactly as she was now, on the same spot, and in the same day of the year, a *century before!* The scenery was the same; the hay was what hay always was and will be; there were also smiling rustics around her now as then. But how different herself!—a single withered leaf in the midst of a green forest. How much had passed notelessly since the former period! What a retrospection!—an eighteenth part of all the time since the birth of Christ! In 1735, there died at Dryhope, in Yarrow, a woman, named Marion Renwick: the American war was then just concluded, and men were beginning to talk about Mr Pitt, the singularly juvenile minister. Strange to say, this woman had been baptized in the year 1682, in the house wherein she *died*, by the good and famous Mr Renwick, who suffered death a fortnight after in the Grassmarket, on account of his religion! Thus were the reigns of Charles the Second and George the Third, so essentially different, brought by one particular life into conjunction. Marion Renwick must have lived under eight sovereigns, counting William and Mary as two; and she had seen the Revolution, the union of England and Scotland, the accession of the Brunswick dynasty, the various civil wars in favour of the house of Stuart, and other political events of signal importance. She had seen Poland defend Christendom against the Turks, and divided, like a spoil, among three of the nations which it had defended. Another of those ancient worthies was the old Countess of Loudoun, whom Dr Johnson visited on his tour to Scotland. She died in 1777, aged one hundred. Her father was that Earl of Stair who directed the massacre of Glencoe in 1691; and her father-in-law's father, the first Earl of Loudoun, had figured at the head of affairs in Scotland during the civil war, and is said by Burnet to have once been or-

* The Rev. Bellingham Swan. He died at 102.

dered for a secret death in the Tower by Charles the First. Her ladyship had survived her marriage seventy-seven years.

A very remarkable beggar appeared on the streets of Edinburgh in the year 1770. He had an uncommonly dignified and venerable appearance, and generally sat bare-headed under a dead-wall in the Canongate. On inquiry being made into his history, it turned out that he was an attainted baronet, named Sir John Mitchell of Pitreavie, who had early in life been an officer in the Scots Greys, but was broke for sending a challenge to the Duke of Marlborough, which he was provoked into by some expressions used by his grace in contempt of the Scottish nation. A subscription was opened on behalf of the venerable unfortunate; but we are not acquainted with its success, or with his subsequent history.

If we go back into a period somewhat earlier, we shall meet with stretches of human existence quite as remarkable. A clergyman, named James Ker, died minister of a parish in Roxburghshire, in 1694—therefore might have been conversed with by Marion Renwick, who lived almost to our own times. Now, this man had been ordained as a clergyman a year before the death of James the First of Great Britain—that is, seventy years before—and, what is still more remarkable, he had for all this time been minister of but one parish, except during the triumph of episcopacy. As he could hardly fail to have been born before the king went to reign in England, we may assume that his life, and that of Marion Renwick, bring us almost into contact with those early days, so different from our own, when Scotland had a distinct king and court. All these instances, however, sink into insignificance compared with that of Henry Jenkins, who died in 1670, at the age of 169. Jenkins must have recollected the reign of Henry the Seventh, who closed the wars of the Roses, and ended the feudal times in England. The events of the Reformation must have been the historical panorama that passed before his eyes in what is generally considered middle life, but which to him was as early childhood. He must have recollected every thing that happened in the sixteenth century, including all the glories of Elizabeth, and almost every thing in the seventeenth too. The lives and recollections of several generations of men were, in a manner, packed into the individual person of this wonderful patriarch: he was an epitome of several ages of history. He must have at length seen so many of the changes wrought by the passions and reason of mankind, that nothing they did would astonish him. "Ah," I can imagine him saying to a modern, who talked of the executions of the regicides, "if you had but seen the fires of Smithfield!" The friends of his early days must have been so long perished from the face of the earth, that they would look like the creatures of a dream; and his very descendants must have at length become almost as alien to him as ordinary strangers. He would seem to himself like a weed cast out upon the shore of human existence, which no returning tide had ever been able to reach; and his memory, like a lachrymatory, could be filled with only the relics of sorrow. In short, a man under Jenkins's circumstances would be the most solitary and friendless of created beings; and his protracted existence would only give him occasion to feel more acutely the inherent pains and drawbacks which attend the condition of mortal life.

A TALE OF THE RHINNS OF GALLOWAY.

It is now many years since my avocations led me, during the summer months, to journey through several of the western districts of Scotland—more particularly Ayrshire and Wigtonshire, and that long narrow neck of fertile land known by the name of the Rhinns of Galloway. I stopped for a week or two at the house of a gentleman, who, from being a "muirland farmer," had, by means of paring and burning, liming, draining, fencing, and all the other modern devices of agricultural improvement, increased it in value to himself at least a hundredfold, during the currency of a long lease, and had finally become purchaser of it. As he was easy in his circumstances, and had his time at his own disposal, he made frequent excursions with me on horseback, sometimes inland, and at others along the interesting and rugged shores of the Solway—the region of so many scenes of death, peril, warlockrie, and witchcraft. During one of these rambles, we came to the ruins of an old tower, which stood on a high eminence about a mile from the rock-girdled beach, and commanded a splendid view towards the Atlantic, and of all the opposite English coast. The building had never been of any great extent or outward importance; but the strong massive walls and castellated style of architecture, together with its well-chosen situation, clearly indicated its having been a place of strength and consequence in former days. Being somewhat of an enthusiast in these matters, I was led to inquire its name and history, with those of its former and present owners, and of the property around. My friend informed me that neither the old turret nor the estate to which it belonged, which was of considerable extent, though in a neglected condition, had had any veritable owner for upwards of fifty years; that it was in the meantime in the hands of the Court of Session, under whose authority the sheriff of the county acted as factor or trustee, and drew what little rent accrued from the pasturage. He added, that they formerly belonged to an Irish family of some note; that the last proprietor had disappeared, when a young man, in a very mysterious manner, and that no trace could ever be got of his fate, or the cause of his disappearance, until very lately, the result of which, if properly established, would be, that the estate and tower would become the property of a poor woman, who had long been supported by private charity in the house of a neighbouring farmer. My curiosity being still further excited by these particulars, my friend remarked, that the story was too long to be communicated in a forenoon's ride, but would inform me of all he himself knew of it over our bottle of port in the evening. At the fitting time, therefore, I reminded him of his promise, which he fulfilled, by detailing to me the following curious narrative:—

Kellholm Peel at one time belonged to a branch of the family of Douglas, but, about the end of the seventeenth century, became, by right of marriage, the property of an Irish gentleman of the name of O'Rourke. The possession came to him, it appears, at a very seasonable time, as his marriage had drawn on him the hatred of most of his Irish connections, with whom, in consequence, he lived in a state of continual strife and feud. The event had particularly excited the jealousy and malice of one of his poorer relatives, whose numerous family, in the event of his dying without heirs, would have come in for a great part of the family estates in Ireland. The new possessor, therefore, lost no time in removing himself and family from a society in which he found no comfort, and not a little danger, and took up his residence at the Peel, trusting to enjoy security and peace, at least, to compensate for the sacrifice of expatriation. In this he was not disappointed, and remained in undisturbed retirement for several years, until, by the death of the family representative in Ireland, the aforesaid property fell into his hands. It was then his troubles began. The same notification which announced his succession, also gave him to understand that the peasantry of the district were violently prejudiced against him, no doubt through the influence of his vindictive and disappointed relatives; that they had been heard to vow resistance to any attempt he might make to assume his inheritance, and even to throw out hints of a darker import in the event of his personally appearing to assert his claims. O'Rourke, however, had too much regard for the interests of his young family, calmly to submit to this unjust deprivation of his rights, and finding, after a time, that there was no hope of his deriving any benefit from his paternal estates by conciliatory means, he resolved to go to Dublin, with the view of laying his case before the legislature, and soliciting either assistance to enforce his claims, or liberty to dispose of the property to any neutral person who might be rash enough to risk his money in the purchase. He set out accordingly—but he never returned. His visit to Ireland, and the purpose of it, was soon bruited amongst his connections; and one night, shortly after his arrival in the Irish metropolis, he was found murdered in the street. It need scarcely be added, that no trace of the assassins was ever obtained, although the quarter whence the blow was struck was readily guessed at. The unfortunate man left a widow and five children, two of whom, twins, were mere infants at the breast; and as the lady had no near relative to assist her in prosecuting her children's claims, the attempting which had proved so fatal to her husband, she resolved to allow them to lie dormant in the meantime, and bring up her family as if they had no such pretensions, trusting to the occurrence of a more propitious period afterwards to revive them. Whether such a time would have arrived or not, must now for ever remain mere matter of conjecture, as an event shortly afterwards took place, which seemed utterly to preclude the possibility of it, and which long excited a deep sensation over the whole district of Galloway, even in those troublous times.

One dark stormy night in December, the few inhabitants who were scattered over that part of the coast were alarmed by the intelligence that Kellholm Peel was in flames. From the distance at which the tower stood from other habitations, it was long before any one arrived, either to ascertain the cause of the conflagration, or aid in extinguishing it. When assistance at last did come, it was found to be as vain as inquiry was useless. Not a vestige of the late inmates was to be found; and the black smouldering embers alone remained, from which to form a guess either at the origin or the extent of the calamity. Not a doubt at first existed that all had perished, and all were equally convinced that the fatal event had been entirely accidental. Several circumstances, however, transpired afterwards to raise doubts on the latter point, and excite suspicion of foul play having been at work. A short unsheathed sword, of very curious and costly manufacture, and bearing evident marks of having been lately worn by its owner, was found a short way down the ancient causeway that communicated between the tower and the beach—farther on, a few articles of infant's apparel—and a soft part of the shore, over which the tide had not flowed, was much marked with the recent impress of human feet. By and bye, it was recollected that a strange schooner had been observed, for several days previous to the fatal event, hovering about the coast with more apparent sense of security than could have been felt by those engaged in a contraband enterprise, yet without any other evident purpose; and it had been suspected that she was a revenue vessel in disguise. But all these facts, however suspicious, led to nothing. The schooner had disappeared, and it was universally believed, that, if she was out at sea on the night of the conflagration, which was uncommonly dark and tempestuous, she must either have gone to the bottom, or been compelled to seek shelter in some of the havens on the coast; and as no intelligence of her was ever afterwards obtained, her destruction was generally considered certain.

If the burning of Kellholm Tower, however, was the work of incendiaries, and the murder or abduction of the family their object, their intentions were in part defeated. It happened that one of the infant twins, a boy, had at its birth been entrusted to the care of one of the tenants' wives to suckle, under whose charge it still remained at the above period, and thus escaped the unhappy fate of the rest of the family. At a crisis of this sort, in all legitimate tales of fiction, it generally happens that some "cruel uncle," or other rapacious relative, who had never been heard of before, suddenly appears on the field to claim the guardianship of the helpless orphan, and plot the means of appropriating all its inheritance to himself. No such obnoxious personage, however, obtruded himself in this instance. The nearest Scottish connection, on whom such a charge naturally devolved, was too actively involved in the many actual and suspected Jacobite conspiracies of the period, to have either time or inclination for taking any personal management of the infant heir or his property, and very readily consented to allow him to remain where he was, in the meantime, until it was seen whether any of his Irish relatives, who had a much nearer title to the office, should come forward. The young laird, therefore, continued in the house of the honest yeoman, and was reared, in all respects, like his own children, saving that, when the time arrived for the commencement of his education, he was sent to the next market town to reside during the summer for that purpose, and a teacher was hired into the house for his instruction in the winter months. From his earliest years, young Douglas (for, from the suspicion and dislike which attached to his Irish connections, his foster-parents had given him his mother's name) exhibited a singularly shy, morose, and eccentric disposition. He could seldom be prevailed on to join in the sports of his youthful compeers, but passed his leisure time in rambling alone about the rocky shore, exploring the caverns and recesses which there abounded. He shunned all intercourse with those he chanced to meet in his rambles, and resolutely refused to accompany his host or his family in any of their very rare visits amongst their neighbours. The only human being, indeed, whose company he was known to seek, and this he did almost daily, was one whom almost every one else avoided, and who was looked upon by the superstitious natives of the coast with mingled feelings of fear and dislike: this was a poor woman, who resided in a wretched turf hut on a bleak and unfrequented rock that hung over the sandy shore, and living no one exactly knew how. She had first appeared there a short while after the burning of Kellholm Peel, carrying a young infant in her arms; had constructed her rude abode with her own hands; and was maintained, to all appearance, solely by the charity of the country people, whose commiseration was excited by her forlorn condition. She was a native of Ireland, and, on her first appearance, could not speak a word of English, so that she was unable, even if she were inclined, to give any account of herself, or her reason for taking up her abode in so wild and strange a place. Not many months after she had fixed her residence as above stated, she was discovered early one morning by some fishermen wandering on the beach without her infant, and in a state of downright insanity. She was also covered with blood from deep wounds on her face, head, and arms, evidently from a sword or other sharp instrument. It was impossible to gather any thing from her at the time, in explanation of her condition, or the disappearance of her child; but after being taken care of, and becoming more composed, she gave them to understand, as well as she could, that several men had entered her hut in the night-time, and had carried off her infant to sea, and that she had received her wounds in trying to save it from them. In those days, the kidnapping of children for the purpose of sending them abroad to our American colonies to be reared as slaves, was carried on to a great extent in Scotland; and although those of age and strength enough to work were most sought after by the inhuman monsters who pursued this horrible traffic, even mere infants were frequently snatched away from the mother's breast. Such, it was at once concluded, was the fate of the poor woman's child, and of course it was thought useless to make any farther inquiry into the matter. Notwithstanding what had happened, however, she had no sooner recovered somewhat from her wounds and agitation of mind, than she returned to her solitary dwelling on the rock, and it was noticed that soon afterwards a remarkable change came over her. From a state of deep dejection and grief, her manner and deportment suddenly assumed that of joy and exultation. She was frequently observed at sunset standing on the rock that rose above her dwell-

ing, pointing with her fingers, and throwing out her arms to the westward, while she chaunted strange dirges in her native tongue. It was likewise remarked that she sometimes disappeared altogether, often for two months or more at a time, going no one knew where, and returning as mysteriously. From these and other equally unaccountable traits in her conduct, it began to be generally believed at last "that she was uncanny." Propitiatory gifts were made to her by the simple inhabitants on the coast, to insure success to their undertakings, whether on sea or shore, and she gradually acquired the denomination of the Witch of the Rock.

Such was the singular being whom the young laird of Kellholm, scarcely less singular, selected as his companion, and whose society alone seemed to have any charms for him. As time rolled on, his attachment for her, and indifference or rather dislike to all others, seemed only to grow more strong. There was evidently some tie that linked them together, and it was also equally plain that there was some one overpowering object which continually engrossed the boy's thoughts; but what these were no one could possibly guess. From his solitary habits and eccentric character, it occasioned little surprise, that, when he became of age to take the management of his property into his own hand, he should take up his residence in the old Peel, which he got repaired and fitted up for that purpose. But it went much beyond the expectations even of those most ready to believe him capable of any strange action, when he selected as his housekeeper and sole companion in retirement the old woman we have just mentioned! Such was the fact, and their mutual habits of life seemed to undergo little change by their cohabitation. He continued still as misanthropic, and shunned all communication with his species which he could possibly avoid; and this propensity he had now an opportunity of gratifying to a greater degree than ever. The old female was still to be seen occasionally on her favourite rock at sunset, and periodically disappeared and returned again as formerly. On one occasion they were *both* missed from the Peel for several months, and when the old woman returned, which was some time after the arrival of the laird, she was accompanied by a young and very handsome woman. Scandal would probably have been busy at this circumstance, which excited no little surprise, had the fact not become known that the young laird had refused to allow her to remain even one night in the Peel. The one succeeding her arrival was passed by her mother and herself in the old hut on the rock, and an arrangement was next day made for her residence with a poor cottager, who was promised a handsome allowance for her maintenance. It was at first hoped that some information might be extracted from this young woman, to throw some light on the strange conduct of the two mysterious individuals at the Peel. But every attempt of this nature was found utterly vain. All that could be ascertained from her, was, that she was from Ireland; that the old woman was her mother, from whom she had been separated early in infancy; but how or where she could not tell. It was therefore unanimously concluded, that she must be the identical infant who had been carried off from the hut on the rock so many years before. From this time the old woman seemed to lose much of her eccentricity and flighty half-frenzied peculiarity of character. She almost daily visited her daughter; and although she still maintained as great a reserve as ever towards those she happened to meet, there was much less of that wildness of look, language, and manner, that had formerly given them so much alarm. A short while only had elapsed, however, after this event, when she again was missed from the Peel, and her absence was protracted much beyond the usual period. It was observed that the young laird appeared to become anxious and restless, resuming his rambles about the rocks on the beach, which, ever since his residence at the Peel, he had in a great measure left off; and repeatedly visited the old woman's daughter, who seemed much distressed at her mother's long absence. But a greater wonder and mystery than any that had yet happened, awaited those whose observation was directed to the strange occurrences at the tower. The young laird again set out on one of his mysterious journeys, and after an absence of several months returned—not alone, however, as usual, but bringing with him a young and beautiful female as his wife! Perhaps no other circumstance could have excited half the surprise which this event occasioned amongst those who had so long known the morose disposition and hermit life of the laird of Kellholm. But if it seemed at variance with all the former tenor of his conduct in one respect, it resembled it as much in another. No one could learn who the lady was, or where she came from! She was evidently of superior rank and manners, but when or by what means he had found time to prosecute his courtship and win her affections, was a complete riddle. There, however, she was, and to all appearance happy in the society of her strange husband, who, whatever he might be to her, maintained his usual repulsive demeanour towards all others. The only addition made to his household after her arrival was in the person of his old housekeeper's daughter, who was transferred from the cottage to the tower. No other person ever entered the door, nor indeed did any one in their own station in life feel inclined to court their society.

(We are obliged to postpone the remainder of this article till the ensuing number.)

POPULAR INFORMATION ON SCIENCE.

THE AURORA BOREALIS.

THE contemplation of the heavens which are above us, naturally suggests reflections and feelings of the purest and most elevated nature, not confined alone to the accomplished philosopher, but enjoyed with equal intensity by the humblest and most unlettered peasant. It is not surprising that the Chaldean shepherd, tending his flocks upon the mountain, and the rude seaman, in the early ages of navigation, studied alike the positions and motions of the heavenly bodies—thence learning to predict the impending changes of weather, and the benign or adverse character of approaching seasons. But the truth is, that we so often witness the splendour of a glorious sunset, and are so familiar with the serene beauty of a starlight night, that we cease to contemplate either with any peculiar feelings of wonder or admiration. When, however, any unexpected or not frequently witnessed luminous meteor bursts upon the sight—whether it be the soft and silvery light of the aurora streaming athwart the azure arch, or some visible globe of fire descending with vivid flame through the surrounding darkness—the human mind becomes startled from its supine indifference, and imagination herself, wondering at the mystery, conjures up a thousand vague and superstitious surmises. The beautiful and often sublime spectacle presented by the aurora borealis has not failed among the vulgar to excite the most ominous predictions and apprehensions; indeed, the extraordinary meteors and appearances in the skies, related as prodigies by historians, are generally referable to the peculiar effects to which this meteor gives rise. Maupertuis remarks, "that in Lapland the sky was sometimes tinged with so deep a red, that the constellation Orion looked as though it were dipped in blood, and that the people fancied they saw armies engaged, fiery chariots, and a thousand prodigies, which were deemed presages of misfortune." In Siberia, between the Lena and Jenesei, on the confines of the icy sea, "the spectral forms," says Gmelin, "appear like rushing armies. The hissing crackling noise of those aërial fireworks so terrifies the dogs and the hunters, that they fall prostrate on the ground, and will not move while the 'ranging host is passing.'" Between Iceland and the Feroe Islands, Kerguelen describes the night as brilliant as the day, "the heavens being on fire with flames of red and white light, changing to columns and arches, until at length confounded into a brilliant chaos of cones, pyramids, radii, sheaves, arrows, and globes of fire." It is no wonder that such appearances in the heavens should give rise to superstitions, and be in an especial manner celebrated by Ossian and other poets. About the period when Queen Anne, the last of the Stuart family, died, an aurora appeared, which, by its brilliancy, attracted universal attention; and this was immediately regarded as a sign from heaven of the accession of a foreign race of princes. Even now, when the aurora presents a still and mild light, it is considered by the ignorant and superstitious as the precursor of famine: and when it darts forth brilliant crimson, and other coloured flashes, it is deemed ominous of war and pestilence. Truly has the immortal Shakspeare observed, that

> No natural exhalation in the sky,
> No common wind, no 'customed event;
> But superstition, from its natural cause,
> Construes awry, and calls them prodigies;
> Signs, fatal presages, and tongues of heaven,
> Plainly denouncing vengeance.

The aurora borealis in this country appears a little after sunset, and uniformly arises in the north, inclining generally a little to the west, and it occurs more frequently about the time of the equinoxes than at any other season of the year. Its manner of arising, and the general characters it assumes, vary extremely; indeed, so much so as almost to preclude any accurate description. Sometimes, an hour or two after dark, it seems to illumine the northern region of the sky with no more than a gentle and subdued twilight, which gives a soft relief to the surrounding darkness. Sometimes detached masses of light suddenly appear in different parts of the sky, from which silvery and tremulous beams shoot with dazzling and evanescent splendour. Not unfrequently, indeed, from one single spot of light, the beams vividly and rapidly extend. Sometimes the phenomenon is first discernible in delicate streaks or threads of light, which enlarge and shift with inconceivable rapidity, until a tremulous arch is formed, which completely spans the azure vault. Very often one general or principal arch is observed, with smaller ones at unequal distances, which frequently move laterally towards each other, and suddenly unite into one broad and brilliant mass. Often from the horizon, in the north, one limb or segment of the arch streams up into the heavens, and sometimes several of these arise at distances from each other. The varying splendour of the coruscations, and the rapid and playful movements which they display, as they sweep across the heavens, excite alike the wonder and admiration of the spectator.

> Ensweeping first
> The lower skies, they all at once converge
> High to the crown of heaven, and all at once
> Relapsing quick, as quickly re-ascend,
> All ether coursing in a maze of light.

Sometimes one broad majestic effulgent arch is seen to move slowly along, and then break into innumerable masses of detached light, or, streaming onward, this one general arch divides into several smaller ones, which recede laterally from each other, leaving between them a soft faint light, or only the deep blue of the distant sky. Often the arch presents the curious appearance of being spirally twisted; and sometimes when several arches have at the same time been visible, they have appeared spirally twisted together. The degree of brightness they exhibit varies exceedingly. Very frequently the extremities of the arch emit a brighter and more vivid light than the centre; but sometimes the arch is brightest in the middle, and becomes fainter and fainter, until the whole is traced into extinction. Instead of the white silvery light which the aurora more frequently displays, sometimes it presents us with the beautiful primitive colours, which, as we have elsewhere explained, constitute, when combined, the white solar beam. The colour of the light of the aurora (says Dr Richardson, in giving an account of this meteor as it appeared in the higher northern latitudes) was generally steel gray; but when a particular modification of cloud was present (the cirro stratus), the light, for the most part, was a gold yellow colour, more or less deep; and when the sky was clear, or only a few fine threads or thin shoots of cloud were visible, the colours were vivid and prismatic." Mr Fisher, in describing an aurora seen by him in Baffin's Bay, says, "it presented distinctly red, orange, yellow, and green colours." The appearance of this phenomenon in Siberia has been compared by a traveller to "the unwinding of a piece of flame-coloured taffeta;" and not many years ago, in Shetland, during the continuance of one of these auroras, "the whole firmament seemed on fire." "On the 28th of September (says a Parisian paper, the *Journal des Debats*), towards eleven o'clock at night, all the northern part of the sky appeared in a blaze. It was supposed that a vast fire had broken out, and that the flames were devouring part of the metropolis. The reflection was as strong, and the reddened atmosphere as fiery, as on the occasion of the great fire breaking out at the theatre of L'Ambigue Comique. Several firemen were running with their engines, when it was ascertained that the fiery appearances affected only the celestial regions. This aurora continued for several hours." Again, a splendid aurora was observed at Gosport, of which we have the following description:—"When it had reached an altitude of several degrees above the Great Bear, it changed from a light yellow to a blood-red colour, which, with the more elevated and vivid flashes, gave it an awfully grand appearance. Its wide column remained perfect, alternately waving and increasing in brilliancy, and ultimately passed through the gradation of colours which is sometimes seen in the clouds near the horizon at sunset—lake, purple, light crimson, &c." In mountainous countries, such as the Hartz and Scottish Highlands, it is surely not surprising that such appearances as these should give rise to superstitious legends, and almost compel a belief in supernatural revelations; but as knowledge advances, the exposition of the real causes of such apparently wonderful and almost inexplicable phenomena, disperses all such superstitious dreams, and leaves us, while we do not admire them the less, to watch with intense interest every change and variation they exhibit. The most frequent colour which the aurora presents in this country, is that of a yellowish white colour; but in the higher northern regions, it displays a peculiar lustre like metals, whence we say it is metallic.

The rapidity and different kinds of motion displayed by the aurora scarcely admit of any description, so variable and uncertain are they. Sometimes we have observed the beams of light, with an arrowy and distinct rapidity, shooting upwards, and athwart the ethereal dome, with amazing and almost incredible celerity. Such very recently we observed from the rude and rocky coast of St Andrews, where, from the north-western part of the horizon, several isolated and distinct beams arose, which, spreading and uniting as they extended rapidly upwards, at length constituted a complete canopy of tremulous and vivid light. Sometimes the motion of the aurora presents a peculiar waving character. Thus, in Hudson's Bay it was said to roll over and over from one end of the arch to the other, as though a volume of luminous matter was unfolded, and rolled from one point over to supply that which escaped and vanished at the other. Parry also compares the waving motions of the horizontal bands of light to the sinuous impulse given to a long ribbon by a person holding it at one end. In the Orkneys, the streams and sheets of light, moving to and fro with peculiar and eccentric rapidity, are termed the "merry dancers." While this effulgent mass of light is moving in the heavens, the stars may frequently be seen distinctly shining through it. Mr Fisher indeed remarks, that the stars so seen display their usual brilliancy; but Captain Parry and Captain Sabine observed that they exhibit an appreciable diminution of lustre.

In the report of the splendid aurora which appeared at Gosport, the notice of which was taken from the Observatory, it is stated, that "the lustre of the stars, of the first, second, and third magnitude, was very little diminished in any part of the heavens where the aurora intervened." It is reasonable to expect, that, as the effulgence of the aurora increases, it will diminish, or, as it were, eclipse, the light of the fixed stars; nay, even the moon itself will sometimes "pale its ineffectual fire," surrounded by its vivid and far-flashing beams. But there is yet another phenomenon attendant on this singularly beautiful meteor, which remains for us to notice, and concerning which con-

siderable dispute has existed—we allude to the noise which is said to accompany it occasionally. By the older writers, both historians and poets, it has been noticed. Thus, Appian likens it to shouts in the air, clashing of arms, and rushing of horses; and an analogous description is given in beautiful language both by Ovid and Virgil. But during the late expedition to the arctic regions, and during Captain Scoresby's numerous voyages to Greenland, the northern lights were not heard to emit any sound; and hence it has been concluded all preceding observers must have been mistaken. As a general rule, all positive is better than negative evidence; for circumstances, very obscure in themselves, may often occur to prevent the repetition of the same phenomenon, when no adequate reason for its non-appearance can be ostensibly perceived. In Siberia, where the aurora appears in greatest perfection, Gmelin, whose description has been translated by Dr Blagden, says, "These northern lights begin with single bright pillars, rising in the north, and almost at the same time in the north-east, which, gradually increasing, comprehend a large space in the heavens, brush about from place to place with incredible velocity, and finally almost cover the whole sky up to the zenith, and produce an appearance as if a vast tent was expanded in the heavens, glittering with gold, rubies, and sapphires. It is attended (he adds farther), as I have heard from the relation of many persons, with such a hissing, crackling, and rushing noise through the air, as if the largest fireworks were playing off." The inhabitants, to describe what they then hear, make use of the expression, "*spolochi chodjat*," that is, "the raging host is passing." Again, Mr Henderson, describing the aurora as it appeared in Iceland, states, that, "when particularly quick and vivid, a crackling noise is heard, resembling that which accompanies the escape of sparks from an electrical machine." Dr Richardson, in his account of the aurora, appended to Captain Parry's interesting narrative, observes, "I have never heard any sound that could be unequivocally considered as originating in the aurora itself; but the uniform testimony of the natives, both Crees, Copper Indians, and Esquimaux, and of all the older residents in the country, induces me to believe that its motions are sometimes audible. Professor Hansteen, inspector of forests at Torsat, having read Captain Scoresby's voyage for the re-discovery of the east coast of Greenland, expresses his surprise that neither he nor any of his attendants had noticed the noise accompanying these northern lights; and adds, that, when very young, he heard, several times during their continuance, "a quick whispering sound." It is also stated by Dr Gisler, that he has "often heard the rushing of these, just as if a strong wind had been blowing;" and that the sound sometimes "resembled the whizzing heard in the decomposition of certain bodies to a chemical process." A mass of contradictory evidence might be adduced; the difficulty consists in determining whether or not such noises might not have accompanied the aurora, without having been produced by it.

The height at which this meteor occurs next claims our attention. "The most remarkable circumstance," says Dr Gisler, "attending the northern lights, is, that although they seem to be very high in the air, perhaps higher than our common clouds, there are yet convincing proofs that they are connected with the atmosphere, and often descend so low in it, that they seem to touch the earth itself, and on the highest mountains produce an effect like wind round the face of the traveller." The height at which the aurora occurs has not yet been satisfactorily determined, although very numerous observations have been made. The ingenious Dr Dalton assigns to it a great elevation: he calculated the height of one arch to be about 150 miles, and that of another to be 100 miles. This computation places the meteor above the ascertained limits of the atmosphere, or at least in regions to which; if the air does extend, it must be in a state of extreme rarity. Mr Cavendish computed the height of an aurora observed by him to be between 52 and 71 miles; and Lieutenant Hood and Dr Richardson, from their observations made during the northern overland expedition, concluded that it occurs in the region just above the clouds, which view has been supported by Mr Farquharson of Aberdeenshire. Captain Franklin observes, "The height of the aurora was not determined by actual observation, but its having been seen on several occasions to illuminate the under surface of some dense clouds, is conclusive that its elevation could not have been very great." There is no doubt that considerable variations in the range or elevation of the aurora must occur, which will indeed be rendered more manifest when we consider the causes which occasion this beautiful phenomenon. Although, to a zealous inquirer, there can be no pleasure so great as that of unveiling the causes of apparent mysteries, yet the chain of cause and effect is often involved in such intricacy, that it cannot be unravelled by any effort of human ingenuity. One of the first conjectures to explain the origin of the aurora, was hazarded by Dr Halley, who imagined that it was produced by inflammable sulphureous vapours, which were exhaled from the earth, and became visible when floating through the northern hemisphere. Euler, the celebrated German philosopher, supposed that the aurora borealis was occasioned by particles of our atmosphere being driven beyond its limits by the impulse of the light of the sun. Beccaria, and many other philosophers, have attributed it to the electric fluid, which, in seeking the south pole, is supposed to become visible in its passage from the north; but neither of these theories are satisfactory. Against the theory of its being attributable to electricity, there are the following reasons:—The electric fluid never accumulates in visible masses; it is always dispersed through the earth and air, and, when its equilibrium is broken, seeks its restoration, by flashing, in the form of lightning, to the readiest conductor. The electric fluid never undulates, or waves to and fro in sinuous curves and motions as the aurora does; nor does it, like it, ever settle in banks of pure light, and remain at once luminous and stationary. Lastly, in the arctic regions the aurora does not affect either the magnetic needle or the electrometer—the instrument used for determining the electrical condition of the air. We are indebted for this latter discovery to the labours of Lieutenant Forster and Captain Parry, who observed, during their different voyages in the arctic regions, with very great accuracy, the relation which was supposed to exist between the aurora and magnetic needle. In Captain Parry's third voyage, in 1824 and 1825, "a most splendid aurora was seen, which actually shot its beams between the observer and the land, which was then distant only 3000 yards; yet did this aurora exercise no disturbing force on the magnetic needle." "Our variation needles (says he), which were extremely light, suspended in the most delicate manner, and, from the weak energy, susceptible of being acted upon by a very slight disturbing force, were never in a single instance visibly affected by the aurora, which could scarcely fail to have been observed at some time or other, had any such disturbance taken place, the needles being visited every hour for several months, and oftener, when any thing occurred to make it desirable." The observations on which Captain Parry and Lieutenant Forster found their conclusions are the most numerous and accurate that have ever been made; and in proof of the high value and the confidence attached to them, we may mention, that the Royal Society of London awarded to them the Copley medal for 1827, in doing which the president ranks among the most important contents of Lieutenant Forster's paper, his "Refutation of the supposed connection between Tremors of the Needle and the Aurora Borealis." Accordingly, there are many cogent objections against our adopting the electrical theory, in place of which it is more satisfactory to consider the aurora as a meteorological phenomenon, produced by the refraction and reflection of the solar light on the subtle vapour which floats in the higher regions of the atmosphere, in support of which opinion we may urge the following reasons:—It is to be remembered, that, some time after sunset, the rays of the sun continue to illuminate the upper region of the heavens; when they fall, therefore, on this refractive medium, it is reasonable to conclude they will be rendered visible upon the earth. Its commencing occasionally an hour or two after dark will depend on the unknown agencies which collect the vapour from which it is to be refracted at one time in preference to another. It will occur also only when the sun is in such a position that its rays can illumine the upper regions of the air, in consequence of which, in winter, before midnight in this country, the phenomenon always disappears. The splendour of its light will obviously depend on the quantity of vapour; and the beautiful colours occasionally displayed, arise from the particles of water being suspended in the vapour, which decompose the rays of solar light, exactly on the same principle upon which the rainbow and other halos are formed. From the extreme tenuity and lightness of this vapour, it must be susceptible of motion from the slightest breath that stirs the air; and thence doubtless arise the tremulous and irregular motions which attend the appearance of the aurora. Such we hold to be the most satisfactory theory in explanation of the origin of this meteor,* which has given rise to so many philosophical speculations.

The popular dogmas of the ignorant are very frequently founded on observation, and, as we have before premised, the appearance of the aurora has generally been considered as significant of approaching storms. "The natives in the high northern regions," says Dr Richardson, "pretend to foretell wind by the rapidity of the motions of the aurora, and say, that, when it spreads over the sky in a uniform sheet of light, it is followed by fine weather, and that the changes thus indicated are more or less speedy, according to the appearance of the meteor early or late in the evening." We may here observe, that this is in confirmation of the above theory; for winds (such as would produce the rapid motion of the vapoury particles, and give the aurora the character described) are often observed to prevail in the higher regions of the air previous to their extending downwards. Hence stars are observed to twinkle, and the streaky cloud called the "mare's tail" is seen previous to such weather. The general fact that the northern lights indicate the nature of the approaching weather, is recognised by Captain Scoresby, who observes, that, from an intelligent old man, he received the following information:—"When seen in the north-west quarter resting near the horizon, without extending their rays to the zenith, they are (in winter) considered indicative of calm frosty weather; when they appear in brilliant display extending towards the south-west, a gale of wind is to be expected; or extending towards the south-east, a southerly gale, with rain or sleet; and when they are seen at a considerable altitude above the horizon, having a red or copper colour, they are supposed to be indicative of a violent storm." Here, again, we observe the effect of the direction of the wind in giving motion to the vapoury particles which reflect in the direction they are urged by the light of the aurora, and also the indication afforded by the decomposition of the light from coming in contact with drops of water suspended in the vapour. Indeed, on looking over numerous meteorological tables, we find, that, generally, the aurora has preceded the occurrence of storms of greater or lesser violence. We may conclude this article by observing, that although the aurora displays itself in its greatest brilliancy in the northern regions, yet it is often observed in the southern latitudes. On February 17, 1773, in south latitude 58°, Mr Foster, who accompanied Captain Cook in his voyage round the world, observed a splendid aurora, which displayed various tints, particularly those of a fiery and purple hue. Captain Bellinghausen, also, who more recently performed a voyage towards the south pole, states, that, during the voyage, when navigating off the Sandwich Islands, the only amusement they had was in the contemplation of the southern auroras, which they always witnessed with pleasure and admiration.

Here, however, apprehensive that we have already exceeded our limits, we must pause, proposing in our next to entertain, and, we hope, instruct our readers, by a further account of other interesting luminous meteors.

* For further arguments in its favour we may refer our readers to "Silliman's American Journal of Science and Arts," vol. xix. p. 235.

LOGAN, THE INDIAN CHIEF.

In an interesting work, entitled "Indian Biography, or an Historical Account of those Individuals who have been distinguished among the North American Natives as Orators, Warriors, or Statesmen," published at New York in the year 1832, we find the following notice of Logan, a personage whose history is little known in this country, though many perhaps have heard of the touching nature of his oratory.

"Few Indian names have been oftener repeated than that of Logan, and yet of scarcely any individual of his race is the history which has reached us less complete. He was a chief of the Six-Nations—a Cayuga—but resided, during most of his life, in a western settlement, either at Sandusky or upon a branch of the Scioto, there being at the former location, a few years before the revolution, about three hundred warriors, and about sixty at the latter.

Logan was the second son of Shikellimus, a respectable chief of the Six-Nations, who resided at Shamokin (Pennsylvania), as an agent, to transact business between them and the government of the state. He was a shrewd and sober man, not addicted to drinking like most of his countrymen, because 'he never wished to become a fool.' Indeed, he built his house on pillars, for security against the drunken Indians, and used to ensconce himself within it on all occasions of riot and outrage. He died in 1749, attended in his last moments by a good Moravian bishop.

Logan inherited the talents of his father, but not his prosperity. Nor was this altogether his own fault. He took no part except that of peace-making in the French and English war of 1760, and was ever before and afterwards looked upon as emphatically the friend of the white man. But never was kindness rewarded like his.

In the spring of 1774, a robbery and murder occurred in some of the white settlements on the Ohio, which were charged to the Indians, though perhaps not justly, for it is well known that a large number of civilized adventurers were traversing the frontiers at this time, who sometimes disguised themselves as Indians, and who thought little more of killing one of that people than of shooting a buffalo. A party of these men, land-jobbers and others, undertook to punish the outrage in this case, according to their custom, as Mr Jefferson expresses it, in a summary way.

Colonel Cresap, a man infamous for the many murders he had committed on those much injured people, collected a party, and proceeded down the Kenhawa in quest of vengeance. Unfortunately, a canoe of women and children, with one man only, was seen coming from the opposite shore, unarmed, and not at all suspecting an attack from the whites. Cresap and his party concealed themselves on the bank of the river, and the moment the canoe reached the shore, singled out their objects, and, at one fire, killed every person in it. This happened to be the family of Logan.

It was not long after this that another massacre took place, under still more aggravated circumstances, not far from the present site of Wheeling, Virginia—a considerable party of the Indians being decoyed by the whites, and all murdered, with the exception of a little girl. Among these, too, was both a brother of Logan, and a sister, and the delicate situation of the latter increased a thousand-fold both the barbarity of the crime, and the rage of the survivors of the family.

The vengeance of the chieftain was indeed provoked beyond endurance, and he accordingly distinguished himself by his daring and bloody exploits in the war which now ensued, between the Virginians on the one side, and a combination mainly of Shawanees, Mingoes, and Delawares, on the other. The

former of these tribes were particularly exasperated by the unprovoked murder of one of their favourite chiefs, SILVER-HEELS, who had in the kindest manner undertaken to escort several white traders across the woods from the Ohio to Albany, a distance of nearly two hundred miles.

The civilized party prevailed, as usual. A decisive battle was fought upon the 10th of October, of the year last named, on Point Pleasant, at the mouth of the Great Kenhawa, in West Virginia, between the confederates, commanded by Logan, and one thousand Virginian riflemen, constituting the left wing of an army led by Governor Dunmore against the Indians of the north-west. This engagement has by some annalists—who, however, have rarely given the particulars of it—been called the most obstinate ever contested with the natives.

The Virginians lost in this action two of their colonels, four captains, many subordinate officers, and about fifty privates killed, besides a much larger number wounded. The governor himself was not engaged in the battle, being at the head of the right wing of the same army, a force of fifteen hundred men, who were at this time on their expedition against the towns of some of the hostile tribes in the north-west.

It was at the treaty ensuing upon this battle that the following speech was delivered, sufficient to render the name of Logan famous for many a century. It came by the hand of a messenger, sent (as Mr Jefferson states) that the sincerity of the negotiation might not be distrusted on account of the absence of so distinguished a warrior as himself.

'I appeal to any white man to say if he ever entered Logan's cabin hungry, and he gave him not meat; if he ever came cold and naked, and he clothed him not. During the course of the last long and bloody war, Logan remained idle in his cabin, an advocate for peace. Such was my love for the whites, that my countrymen pointed as they passed, and said, "Logan is the friend of white men." I had even thought to have lived with you, but for the injuries of one man. Colonel Cresap, the last spring, in cold blood, and unprovoked, murdered all the relations of Logan, not sparing even my women and children. There runs not a drop of my blood in the veins of any living creature. This called on me for revenge. I have sought it: I have killed many: I have fully glutted my vengeance. For my country, I rejoice at the beams of peace. But do not harbour a thought that mine is the joy of fear. Logan never felt fear. He will not turn on his heel to save his life. Who is there to mourn for Logan? Not one.'

Of this powerful address, Mr Jefferson says, 'I may challenge the whole orations of Demosthenes and Cicero, and of any more eminent orator, if Europe has furnished more eminent, to produce a single passage superior to the speech of Logan;' and an American statesman and scholar, scarcely less illustrious than the author of this noble eulogium, has expressed his readiness to subscribe to it. It is of course unnecessary for any humbler authority to enlarge upon its merits: indeed, they require no exposition—they strike home to the soul.

The melancholy history of Logan must be dismissed with no relief to its gloomy colours. He was himself a victim to the same ferocious cruelty which had already rendered him a desolate man. Not long after the treaty, a party of whites murdered him as he was returning from Detroit to his own country. It grieves us to add, that, towards the close of his life, misery had made him intemperate. No security and no solace to Logan was the orator's genius or the warrior's glory."

POISONS OF THE ANCIENTS.

AT the College of Physicians, London, Sir Henry Halford lately read a curious paper, in which he investigated the causes of the death of certain celebrated characters of antiquity, with especial reference to the knowledge of poisons possessed by the ancients. Sylla, he observed, died in consequence of the rupture of an internal abscess, through an excess of rage, which, according to Valerius Maximus, produced a violent vomiting of blood, and death. Crassus, the eminent lawyer, and friend of Cicero, died of pleurisy; and Sir Henry remarked, that the course of treatment for this disorder prescribed by Celsus, and in use at the time, namely, bleeding, cupping, and blistering, was so similar to that pursued at the present day, that nothing was probably left undone that could have saved his valuable life. Pomponius Atticus, whom Cicero loved as a brother, and who was on friendly terms with all parties in the disturbed times in which he lived, was said to have died of a fistula in the loins; it was probably, Sir Henry thinks, a dysentery, ending, as that disorder commonly does, in an affection of the lower bowels. He had recourse to starvation, a very common expedient amongst the Romans, and died in ten days, aged seventy-seven. The latter end of Socrates was brought about by the common mode of dispatching persons capitally convicted at Athens, namely, by a narcotic poison; but neither Xenophon nor Plutarch tells us the species of poison. The poisons of this class known to the ancients were aconite, white poppy, hyoscyamus, and hemlock. The black poppy might be the Theban drug. The hyoscyamus was used at Constantinople, and was very likely the nepenthe spoken of by Homer. But most probably the poison administered to Socrates was the same given to other condemned criminals, viz *cicuta*, hemlock. Juvenal attributes his death to hemlock. Whatever may have been the species of poison, it was one of weak and slow operation; for the executioner told Socrates that if he entered into earnest dispute, it would prevent its effect, and it was sometimes necessary to repeat the dose three or four times. Its operation was gradually to produce insensibility, coldness of the extremities, and death. What was that poison by which Hannibal destroyed himself? It is improbable we shall ever know. Modern chemistry has discovered a variety of subtile poisons that might be introduced into a ring, and, under certain circumstances, destroy life. One drop of prussic acid might produce paralysis, and, if taken into the stomach, would instantly arrest the current of life. But it was not likely that the Carthaginians were acquainted with prussic acid. Lybia most probably produced poisons sufficiently subtile and destructive to accomplish the fatal purpose of Hannibal. As to the report of its being bullock's blood, that, Sir Henry Halford observed, must be a fable, as well as in the case of the death of Themistocles, for it is well ascertained that the blood of that animal was not poison. An accomplished nobleman had told Sir Henry that he had been present at a bull-fight in Spain, when, after the matador had killed the bull, a person ran up, caught the animal's blood in a goblet, and drank it off, as a popular remedy for consumption. With respect to the poison with which Nero destroyed Britannicus, comparing the account given by Tacitus with the effects of laurel-water, Sir Henry was disposed to think that this was the identical drug.

BIOGRAPHIC SKETCHES.

HEYNE.

THE ardour with which knowledge has frequently been pursued amidst all sorts of difficulties and discouragements, is the best evidence we can offer of the strength of the passion which has sprung up and lived in circumstances so unfavourable to its growth, and therefore of the exquisite pleasure which its gratification is found to bring with it. If the permanence of any pleasure, indeed, is to be looked upon as one of the proofs of its value, there are certainly none but those of virtue and religion that can be compared with the pleasures of intellectual exertion.

The enjoyments of sense, to say nothing of their comparatively short endurance, their certainty to pall upon repetition, and the positively injurious and destroying tendency of many of them, are, from the nature of things, necessarily limited in point of number; for the senses themselves are but few, and no one of them has many varieties of enjoyment to communicate. What are even the highest pleasures brought us by the eye, or the ear, apart from that character which they derive from the moral or intellectual associations they awaken?—momentary excitements for the child, but hardly the gratifications even of a moment to the man—as is abundantly evidenced by the case of many a one in whom the mere corporeal organ is as perfect as usual, but who, nevertheless, hardly receives from it any pleasure worth naming, owing to the uncultivated state of those mental faculties, which are truly the great creators and bestowers of human happiness. But when did we hear of any one who, having fairly commenced the pursuit of literature or science, ever became tired of it, or would not have gladly devoted his whole life to it, if he could? There may be other passions to which men will deliver themselves up, in the first instance, with greater precipitation and impetuosity; there is none, assuredly, which will engage them so long, or eventually absorb their whole thoughts so thoroughly, as the passion for knowledge. We have numberless instances of persons, in every rank of life, who, for the sake of gratifying it, have contended with and overcome such difficulties and impediments of all sorts, as certainly would have worn out the strength of almost any other impulse with which we are acquainted. But this is an impulse which, we may venture to affirm, when once truly awakened, no discouragements that the most unfavourable circumstances have interposed have ever been able effectually to subdue.

The late Professor Heyne, of Gottingen, was one of the greatest classical scholars of his own or of any age, and during his latter days enjoyed a degree of distinction, both in his own country and throughout Europe, of which scarcely any contemporary name, in the same department of literature, could boast. Yet he had spent the first thirty-two or thirty-three years of his life, not only in obscurity, but in an almost incessant struggle with the most depressing poverty. He had been born, indeed, amidst the miseries of the lowest indigence, his father being a poor weaver, with a large family, for whom his best exertions were often unable to provide bread. In the "Memoirs of his own Life," Heyne says—"Want was the earliest companion of my childhood. I well remember the painful impressions made on my mind by witnessing the distress of my mother when without food for her children. How often have I seen her, on a Saturday evening, weeping and wringing her hands, as she returned home from an unsuccessful effort to sell the goods which the daily and nightly toil of my father had manufactured!" His parents sent him to a child's school in the suburbs of the small town of Chemnitz, in Saxony, where they lived; and he soon exhibited an uncommon desire of acquiring information. He made so rapid a progress in the humble branches of knowledge taught in the school, that, before he had completed his tenth year, he was paying a portion of his school fees by teaching a little girl, the daughter of a wealthy neighbour, to read and write. Having learned every thing comprised in the usual course of the school, he felt a strong desire to learn Latin. A son of the schoolmaster, who had studied at Leipsic, was willing to teach him at the rate of fourpence a-week; but the difficulty of paying so large a fee seemed quite insurmountable. One day he was sent to his godfather, who was a baker in pretty good circumstances, for a loaf. As he went along, he pondered sorrowfully on this great object of his wishes, and entered the shop in tears. The good-tempered baker, on learning the cause of his grief, undertook to pay the required fee for him, at which, Heyne tells us, he was perfectly intoxicated with joy; and as he ran, all ragged and barefoot, through the streets, tossing the loaf in the air, it slipped from his hands, and rolled into the gutter. This accident, and a sharp reprimand from his parents, who could ill afford such a loss, brought him to his senses. He continued his lessons for about two years, when his teacher acknowledged that he had taught him all he himself knew. At this time his father was anxious that he should adopt some trade, but Heyne felt an invincible desire to pursue his literary education; and it was fortunate for the world that he was at this period of his life furnished with the means of following the course of his inclination. He had another godfather, who was a clergyman in the neighbourhood; and this person, upon receiving the most flattering accounts of Heyne from his last master, agreed to be at the expense of sending him to the principal seminary of his native town of Chemnitz. His new patron, however, although a well-endowed churchman, doled out his bounty with most scrupulous parsimony; and Heyne, without the necessary books of his own, was often obliged to borrow those of his companions, and to copy them over for his own use. At last he obtained the situation of tutor to the son of one of the citizens; and this for a short time rendered his condition more comfortable. But the period was come, when, if he was to proceed in the career he had chosen, it was necessary for him to enter the university; and he resolved to go to Leipsic. He arrived in that city, accordingly, with only two florins (about four shillings) in his pocket, and nothing more to depend upon except the small assistance he might receive from his godfather, who had promised to continue his bounty. He had to wait so long, however, for his expected supplies from this source, which came accompanied with much grudging and reproach when they did make their appearance, that, destitute both of money and books, he would even have been without bread too, had it not been for the compassion of the maid-servant of the house where he lodged. What sustained his courage in these circumstances (we here use his own words) was neither ambition nor presumption, nor even the hope of one day taking his place among the learned. The stimulus that incessantly spurred him on was the feeling of the humiliation of his condition—the shame with which he shrunk from the thought of that degradation which the want of a good education would impose upon him—above all, the determined resolution of battling courageously with fortune. He was resolved to try, he said, whether, although she had thrown him among the dust, he should not be able to rise up by his own efforts. His ardour for study only grew the greater as his difficulties increased. For six months he only allowed himself two nights' sleep in the week; and yet all the while his godfather scarcely ever wrote to him but to inveigh against his indolence—often actually addressing his letters on the outside, "*To M. Heyne, Idler, at Leipsic.*"

In the meantime, while his distress was every day becoming more intolerable, he was offered, by one of the professors, the situation of tutor in a family at Magdeburg. Desirable as the appointment would have been in every other respect, it would have removed him from the scene of his studies—and he declined it. He resolved rather to remain in the midst of all his miseries at Leipsic. He was, however, in a few weeks after, recompensed for this noble sacrifice, by procuring, through the recommendation of the same professor, a situation similar to the one he had refused in the university town. This of course relieved for a time his pecuniary wants; but still the ardour with which he pursued his studies continued so great, that it at last brought on a dangerous illness, which obliged him to resign his situation, and very soon completely exhausted his trifling resources, so that on his recovery he found himself as poor and destitute as ever. In this extremity, a copy of Latin verses which he had written having attracted the attention of one of the Saxon ministers, he was induced, by the advice of his friends, to set out for the court at Dresden, where it was expected this high patronage would make his fortune; but he was doomed only to new disappointments. After having borrowed money to pay the expenses of his journey, all he obtained from the courtier was a few vague promises, which ended in nothing. He was obliged eventually, after having sold his books, to accept the place of copyist in the library of the Count de Bruhl, at the miserable annual salary of one hundred crowns (about L.17 sterling)—a sum which, even in that cheap country, was scarcely sufficient to keep him from perishing of hunger. However, with his industrious habits, he found time, besides performing the duties of his situation, to do a

little work for the booksellers. He first translated a French romance, for which he was paid twenty crowns. For a learned and excellent edition which he prepared of the Latin poet Tibullus, he received, in successive payments, one hundred crowns, with which he discharged the debts he had contracted at Leipsic. In this way he contrived to exist for a few years, all the while studying hard, and thinking himself amply compensated for the hardships of his lot, by the opportunities he had of pursuing his favourite researches, in a city so rich in collections of books and antiquities as Dresden. After he had held his situation in the library for above two years, his salary was doubled; but before he derived any benefit from the augmentation, the seven years' war had commenced. Saxony was overrun by the forces of Frederick the Great, and Heyne's place, and the library itself to which it was attached, were swept away at the same time. He was obliged to fly from Dresden, and wandered about for a long time without any employment. At last he was received into a family at Wittenberg; but in a short time the progress of the war drove him from this asylum also, and he returned to Dresden, where he still had a few articles of furniture, which he had purchased with the little money he saved while he held his place in the library. He arrived just in time to witness the bombardment of that capital, in the conflagration of which his furniture perished, as well as some property which he had brought with him from Wittenberg, belonging to a lady, one of the family in whose house he lived, for whom he had formed an attachment during his residence there. Thus left, both of them, without a shilling, the young persons nevertheless determined to share each other's destiny, and they were accordingly united. By the exertions of some common friends, a retreat was procured for Heyne and his wife in the establishment of a M. de Leoben, where he spent some years, during which his time was chiefly occupied in the management of that gentleman's property.

At last, at the general peace in 1763, he returned to Dresden; and here ended his hard fortunes. Some time before his arrival in that city, the professorship of eloquence in the University of Gottingen had become vacant by the death of the celebrated John Mathias Gesner. The chair had been offered, in the first instance, to David Ruhnken, one of the first scholars of the age, who declined, however, to leave the University of Leyden, where he had lately succeeded the eminent Hemsterhuys as Professor of Greek. Fortunately, however, for Heyne, Ruhnken was one of the few to whom his edition of Tibullus, and another of Epictetus, which he had published shortly after, had made his obscure name and great merits known; and with a generous anxiety to befriend one whom he considered to be so deserving, he ventured, of his own accord, to recommend him to the Hanoverian minister as the fittest person he could mention for the vacant office. Such a testimony from Ruhnken was at once the most honourable and the most efficient patronage Heyne could have had. He was immediately nominated to the professorship, although so little known that it was with considerable difficulty he was found. He held this appointment for nearly fifty years; in the course of which, as we have already remarked, he may be said, by his successive publications, and the attraction of his lectures, to have placed himself nearly at the head of the classical scholars of his age; while he was at the same time loved and venerated as a father, not only by his numerous pupils, but by all ranks of his fellow-citizens, who, on his death, in 1812, felt that their university and city had lost what had been for half a century its chief distinction.*

MARRIAGE OF JAMES THE SIXTH.

It is generally known that King James the Sixth of Scotland (and First of England) was a monarch of a droll and familiar character. He exemplified this in a particular manner in the transactions connected with his marriage, which took place in the year 1589, when he was twenty-three years of age, and about thirteen years before he acceded to the English throne. The lady of his choice was the Princess Anne of Denmark, and the marriage took place by proxy or deputy in the month of August, at the Danish court. She was delayed, however, by storms, and the king being informed that she would not be able to reach Scotland till spring, resolved to go to Norway, where her vessel had taken shelter, in order to meet her. Previous to doing so, he published, for the satisfaction of his subjects, an account of all the reasons moving him to take so extraordinary a step—which were as follows:

"First of all," says he, "I doubt nocht it is manifestlie knawne to all how far I was generally found fault with be all men for the delaying sa lang of my mariage. I wes allane, without fader or moder, bruthir or sistar, king of this realme, and air appeirand of England; this my naikatnes maid me to be waik, and my inemyis stark; ae man wes as na man, and the want of hoip of succession bread disdayne; yea, my lang delay bred in the breistis of mony a grite jealousie of my inhabilitie, as gif I wer a barrane stok: Thir ressonis, and innumerable otheris hourly objected, moved me to haisten the treaty of my mariage; for as to my awne nature, God is my witnes, I could have abstenit langair nor the weill of my patrie could have permitted. I am knawne, God be praised, not to be very intemperatly rashe nor concety in my wechtiest effairis; nather use I to be sa carved away by passioun as I refuse to heir reasoun." He then tells, that, having understood the queen could not come to him, he resolved to go to her. "The place that I resolvit this in wes Craigmillair, not ane of the haill counsale being present there; and as I take this resolutioun onlie of myselff, as I am a trew prince, sa advised I with myselff onlie quhat way to follow furth the same." Then he tells that he assembled the council at Edinburgh, for the purpose of having ships prepared; but finding them difficulted as to the fitting out a sufficient number to be an honourable convoy for the King of Scotland, he "wes compelled to avow with grite vehemencie, that, giff thay could be gottin na othir to gang, I suld ga myselff allane, *gif it were but in ane ship:* But giff all men (said I) had bene as weill willit as became thame, I neidit nocht be in that strait." This reproach was designed for the Chancellor Maitland; and it stung him so, that he offered to accompany the king. James, however, consulted him no further till his departure; "twa ressouns moving me thereto; first, because I knew that giff I had maid him on the counsaill thairof, he had been blameit of putting it in my heid, quhilk had not bene his dewitie, for it becumis na subjectis to giff princes advice in sic materis; and therfoir, remembering quhat invyous and injust burding he dalie beires, *for leiding me by the nose*, as it wer, to all his appetytis, as giff I wer ane unressonable creature, or a bairne that could no nothing of myselff, I thocht pitie then to be the occasioun of the heaping of further injust sklander upoun his head. . . . . This far I speik for his parte, alsweill for my awin hounouris saik, that I be not sklanderit *as ane irresolute asse*, quha can do nathing of himselff, as also that the honestie and innocencie of that man be not injustlie and untrewlie reprochedd."

Having appointed his kinsman, the Duke of Lennox (son to his former favourite), regent in his absence, with Francis Earl of Bothwell for a coadjutor, and having put the above most amusing declaration into the hands of his clerk-register, James, on the 19th of October, secretly embarked on board a small ship at Leith, with his chancellor, and immediately set sail for Norway, accompanied by other four vessels. This little fleet at first encountered rough weather, which detained it in the Frith of Forth for the better part of a week; but at length a fair wind sprung up, which carried him over to Slaikray in Norway, in the short space of four days. From Slaikray he immediately advanced, partly by land and partly by sea, to Upslo, where the queen was still remaining. Arriving on the 19th of November, he was immediately introduced—"boots and all," says David Moyses—to the queen's lodging; his eagerness to see the young person with whom he was destined to spend his life being too great to admit of the proper ceremonials. His conduct at the first interview was spirited enough, to be of a piece with the whole enterprise. He attempted to salute his consort, after the fashion of his country, with a kiss. She, ignorant of the good Scottish custom, refused to admit of his embrace. But says Moyses, with delightful quaintness, "after a few words privately spoken betwixt them, there followed a farther familiarity, and some kisses."

They were married on the 23d, Mr David Lyndsay, the king's own minister, performing the nuptial ceremony in the French language. James next morning presented his bride with the lordship and palace of Dunfermline, by way of a *morrowing gift*, as it was called, a present usually made in that age by a bridegroom to his bride, on the morning after their nuptials: Dunfermline, therefore, became what in modern language would be called the queen's jointure-house. Immediately after the marriage, ambassadors came from the court of Denmark, soliciting James to delay his return to Scotland till the beginning of the next year, and spend the intermediate time in Copenhagen. In consideration of the weather, and partly perhaps for reasons of state, he consented to this proposal; and, on the 22d of December, he and Queen Anne set out from Upslo on their journey to Denmark. They arrived, on the 21st of January, at Chronenburg Castle, on the celebrated Straits of Elsinore, where they were received with great distinction and rejoicing by the young king, his mother, and the four regents of the kingdom. It was proposed and agreed to, that they should remain till the solemnization of the marriage of Anne's eldest sister to the Duke of Brunswick.

The Danes at this time were perhaps the most convivial people on the face of the earth. Spottiswood, in recording that no quarrels occurred among the king's attendants all the time they were in Denmark, says, with great simplicity, that this was the more wonderful, since "it is hard for men in drink, *at which they were continually kept*, long to agree." James himself dates a letter from "Chroneburg, *quhaire we are drinking and dryving ower in the auld maner;*" a most amusing trait of self-portraiture. I need scarcely remind the reader, moreover, of the authenticated tradition regarding the whistle of the family of the Lauries of Maxwellton, which was won by an ancestor from a bacchanalian champion among the Danes, who had challenged the Scottish topers, on this occasion, to a trial of strength, and was fairly drunk under the table, after an almost unexampled debauch.*

James continued in Denmark during the entire months of February and March 1589–90, in the enjoyment not only of the pleasures of the social board, but also of a series of pageants and shows, which were got up by the court for his entertainment. He in the mean time sent home intelligence to Scotland that he had the greatest reason to thank the Almighty for having "clothed him with a wife" of the most excellent "giftis and comodities." From time to time he received intelligence, in return, from Scotland, that the country had never been in a quieter state; only two disturbances having happened during the whole winter—one occasioned by the clan Gregor in Balquhidder, the other by "that wicked and insolent man," as Spottiswood terms him, Archibald Wauchope of Niddrie, who had killed a dependant of the Abbot of Holyrood—whereas, in general, there was seldom a week without some dreadful tale of murder or riot.

James, who, previous to his marriage, had seen no place besides the southern district of Scotland, appears to have been very much impressed by the sight of the continental states in which he was now sojourning, and to have drawn no favourable contrast between their magnificence—humble as it was, compared with that of the southern states of Europe—and the wretched poverty of his own country. He also seems to have been surprised not a little at the strength of the *executive* in Denmark, as compared with its weakness in Scotland. He naturally became anxious, that, before his return, when, besides the queen, many dignified persons of her brother's court were to attend him, the objects which were to be presented to their eyes should be of as respectable a kind as the circumstances of the country would permit—that his palace should be put into good order, that the persons who were to receive him on the shore should be of good character, and that there should be none of those shameful breaches of the peace which had all along disgraced his reign, and than which nothing was better calculated to give the strangers a mean idea of his government. Inspired by these notions, we find him writing a letter to his council in February, imploring them, with ludicrous earnestness, to prepare the country in a befitting manner for his arrival. The letter is a great curiosity, and as it is sure at once to amuse the reader, and to increase his acquaintance with the king's character and style of writing, it is here inserted.

"My lords of counsal, that this general letter of mine may serve, asweill to you all, as to every one of yow in particular, lay the blame, I praye yow, upon the hast and fascheousnes of the dispatche, and not upon my sweirnes, althoughe I cannot denye, that to write with my own hand I am both slawe and sweire aneuch: I doubt not that you wille tak this in all good part, as if I wrote a trough of paper to every one of yow.

Ye may now knaw, by the season of the yeir, that my coming home, God willing, drawes neire. I am surely treated here with all the honor and hartliness that this contrie people can imagine, I think we should not be unthankfull when theires comes in our bounds. *A king of Scotland with a new marid-wyfe, will not come hame every day.* For God's sake, respect not onely my honor in this, but the honor of our whole nation, and speciallie of yourselffis; for my part will be leist in it. It is knowne that I am absent, and all the warld knaws that when the gudeman is away, he cannot be wyted of the misorders in the house; but what may he think then of his servants and factors he has left therein?

Now, my lords, since this is the only grete proof of your diligence, without my presence or assistance, that ever I am able for to have of you, let me knawe now what remembrance ye have of me during my absence, by diligent remembring and performing such directions as the beirar hereof, the Master of Wark, hes in charge of me to deliver unto you. Remember specially upon the ending out of the abbay, as yet lying in the deid-thraw, without the which we cannot be lodgit at our landing; and in good faith it is not the maner of this countrie to lye therout, for the greatnes of the frost; and for a token that ye have not forgotten us, ye may send two or three ships here to show us the way home; but let nae great men or gentilmen come in them, but many gude marinells; for I am already overchargeable to these folks here; besides that every one of you will have eneuch to do in the turnes I have employed you to do at hame. For Godsake, in any thing, respect my honor, that all discords and vaniteis and quarrells may be supercedit at this; for gif I took sic strait order for that the last yeir, when I lookit for my weifs coming hame and a certayne companye of strangers with her, how muckle mare sould it be this yeir when we are baith to cum hame and twice as gret a numbre of strangers, and speciallie sen I have seen so gude ane example in this countrie.

Indede, I have gude cause to thank yow all for the great quietnes that ye have already keept, as I perceive by your last letters. Remember likewise that nae great man or counsellar presume to be at our landing, but suche as the beirar hereof will in a roll deliver unto you, ut omnia fiant decenter et cum ordine.

Fail not to provide gude cheare for us; for we have heir abundance of gude meit and *part of drinck;* to the particulars of this I remit to my directions, as of all other things likewise.

To conclude, I bothe pray you, and command you sleuth na tyme, and for my part sake do at this tyme

* Abridged from "Library of Entertaining Knowledge."

* See Burns's Poems.

even mair nor is possible; for ye knaw I will never eit nor drink a fair wind.

From the Castle Croneburg, the 19 day of February 1589. JAMES, REX."

The same solicitude is apparent in a letter of the same date, which the king wrote to the reverend Robert Bruce, one of the ministers of Edinburgh. He had left Bruce a member of the privy council, and with a kind of implied commission of supervision over the morals of the kingdom. He now writes to him in a familiar strain, beseeching him to exert himself to keep the people in order before his return. "Waken up all men," he says, "to attend my coming; for I will come, as our maister sayeth, like a thief in the night, and whose lampe I find burning with oyle, these will I coin thanks to, but those that lack their burning lamps, provyded with oyle, will be barred at the door; for I will not accept their crying, Lord, Lord! at my coming, that have forgot me all the time of my absence. . . . *For God's sake, take all the pains you can, to teach our people weill against our coming, lest we be all ashamed before strangers.*" Could any thing be more characteristic of this singular monarch, so well aware as he always was of what ought to be done, and so willing that it should be done, yet so incapable of using the proper coercive measures for doing it? "I think this time," he adds, "should be a holy jubilee in Scotland, and our ships should have the virtue of the ark in agreeing, *for a time at least*, naturales inimicitias inter foras; for, if it otherwise fall out (quod Deus avertat), I shall behove to come hame like a drunk man amongst them, which would be no strange thing, coming out of so drucken a countrie as this!" Then the necessities of the poor king are displayed. "I pray you," he says, "heartilie recommend me to the good provost of the town, and in any thing he can pray him to assist my affairs, as I have ever been certain of his good will in my services. Specially desire him to further all he can the outreeking of three or four ships to meet me here, and convoy me hame." [He had been enabled to sail for Denmark, solely by the generosity of a few private individuals, who each fitted out a little vessel.] "And likewise, I doubt not he will assist the Maister of Wark in getting as many good craftsmen as may be had for ending out the half-perfyted abbey [his palace], that now lies in the deid-thraw * * * Thus recommending me and *my new rib* to your daylie prayers, I commit you to the only all-sufficient.

Perhaps the reader will be inclined not only to smile at these indications of the poverty and imbecility of the Scottish monarch, but also to blame him in serious earnest for what is so inconsistent with the dignity of a sovereign. He should, however, pause to consider the dilapidated state in which James found his government and revenues when he came of age; he should consider the power of the nobles, many of whom could raise at any time far more men than their king; and he should reflect on the barbarous condition of the people, just emerged from the horrors of a protracted civil war, and from the vices incident to an age of religious reformation. As for the pecuniary distresses of the sovereign, which here appear so extreme, he actually seems to have had no resource whatever, on any occasion of unusual expense like the present, except the benevolence of a few of the burghs, chiefly those of Fife, which was then the most commercial and the richest province of Scotland. The proper revenues of the crown had long before this time been alienated and embarrassed almost to extinction.

James's poverty, however, was perhaps never less distressing to him than on the present occasion. The pride of country, for which the Scotch have always been remarkable, induced them to do all in their power to fulfil his wishes in regard to the appearance of the kingdom before the expected strangers, and also in respect of the vessels which he desired to have sent out for his convoy home. By an extraordinary exertion, though at the expense of a great multitude of individuals, the palace was finished and furnished in very splendid style, another house in the city was prepared for the queen's Danish friends, a few small Fife coasters were sent out to Denmark, and a great variety of articles were prepared for the pageantries which were to be enacted on his arrival. Besides these more important arrangements, there were some of a humbler nature, which equally marked the desire of the people to put the country into a holiday attitude. The town council of Edinburgh, resolving that the strangers should see as little as possible of the filth and the mendicity for which the country was remarkable, ordained that "all persons purge and cleuze the streits, calsayis, and gutteris fornent their awin housis to the mid channel, as weill in the hie gait [*principal street*] as in the vennelis [*lanes*]," and that "all beggaris remove, swa they be nocht fund beggand within this brugh, or betuix this and Leith, or ony uther part within the liberty or jurisdiction of this burgh." They also ordained the bailies "to pas throw their quarteris, and borrow fra the honest nychtbouris thairof ane quantitie of the best sort of thair neiprie [*table linen*], to serve the strayngeris that sall arryve with the queen, and the said bailies to gif the nychtbouris thair awin ticket of ressait thairof."

On the 1st of May, after these and sundry other preparations had been made, the king and queen arrived at Leith, accompanied by the admiral of Denmark, and other persons of dignity, and having a convoy of thirteen large Danish ships of war. The citizens of Edinburgh and Leith immediately flocked to the shore, each in his best clothes and arms. About seven at night, the king led the queen ashore, "by a trance covered with tapestrie and cloth of gold, that her foot might not touch the earth. The Duke of Lennox, the Earls of Mar and Bothwell, with sundrie others, received them at the stayr-heads. The castle and ships shot great vollies." Mr James Elphinston, a senator of the college of justice (afterwards Lord Balmerino), welcomed the royal pair in a Latin oration. "The queen being placed in her lodgings, the king took the chief of the Danes by the hand, every one after another." [Between thirty and forty of these persons were dignified men, with "goldin chenyeis of guid faschioun;" and the whole number was two hundred and twenty-four.] The king now received a visit from the minister Bruce, whose services in keeping the country quiet during his absence he acknowledged in very warm terms, afterwards accompanying him to the church of Leith, to return thanks to the Almighty for his prosperous voyage.

As the preparations at Holyroodhouse were scarcely yet completed, James remained for a few days in a palace, called "the Kingis Wark," at Leith, his train chiefly lodging in the ships. At length, on the 6th of May, the royal party made their progress towards Edinburgh. "The king and nobility rode before; the queen came behind, in her Danish chariot, with her maids of honour, on each side of her majesty one. The coach was drawn by eight horses, caparisoned in purple velvet, embroidered with gold and silver, very rich. The town of Edinburgh, Canongate, and Leith, in their arms, gave a volley of shot to the king and queen in their passage, in joye of their safe arryval." "In this manner, they passed to the Abbey of Holyroodhouse," where "the king, taking the queen by the hand, led her through the inner close to the great hall, and thereafter to the chambers, which were richly hung with cloth of gold and silver."

The queen was crowned in the abbey church, on Tuesday, the 17th of May, Mr Robert Bruce performing the chief offices, which formerly used to be done by a bishop. The Presbyterian ministers on this occasion scrupled greatly about the propriety of anointing the queen, judging that ceremony to be of a somewhat Popish savour; but James knew how to bring them to reason: he hinted that he could wait a little, till a certain bishop, whom he mentioned, could make it convenient to come to Edinburgh, to perform the ceremony. Alarmed at what he said, they lost no time in agreeing that there was no harm in the oil, and the ceremony was accordingly performed in the usual way. When it was concluded, Andrew Melville uttered a long congratulatory poem, in Latin hexameters, to the great delight of the king and his friends, who joined in soliciting that it should be printed. This poem was so elegant in its construction, and so apt to the occasion, as to attract the praise of the best foreign scholars, and to extend the fame of this great event in the life of James farther than it perhaps could have otherwise travelled.*

HINTS FOR WORKMEN.

THE faults of well-paid workmen are not deficient industry, but excessive, or at least irregular, exertion. When liberally paid by the piece, they are tempted to overwork themselves, and to ruin their health and constitution in a few years. This is the case of porters, coalheavers, and many common labourers in London. A carpenter is not supposed to last in his utmost vigour above eight years. The double wages paid to country labourers during harvest, or to tailors during a general mourning, are frequent sources of permanent injury, from the inducement they offer to over-exertion. Almost every class of artificers are subject to some peculiar diseases, occasioned by excessive application to their peculiar species of work. Ramuzzini, an Italian physician, and Thackrah, an English surgeon, have written treatises concerning such diseases. Excessive application during one part of the week is frequently the cause of the idleness complained of during the remainder. "Great labour," Dr Smith remarks, "either of mind or body, continued for several days together, is in most men naturally followed by a great desire for relaxation, which, if not restrained by force or some strong necessity, is almost irresistible. It is the call of nature, which requires to be relieved by some indulgence," or change of occupation. Relaxation does not always imply idleness, but, as Locke expresses it, "easing the wearied part," by exchange of employment. If not complied with, the consequences are often dangerous, and sometimes fatal; and such as almost always bring on, sooner or later, the infirmity of the trade. If masters would be more humane, and journeymen more reasonable, both would see the utility of temperate exertions of industry. The man who works so moderately as to be able to work constantly, not only preserves his health the longest, but, in the course of the year, executes the greatest quantity of work. Labour, without reasonable intervals of rest for meals and relaxation, exhausts the energies of both body and mind, and is of the two more hurtful than low wages, which abridge diet and physical comforts.

Mr Thackrah, to whom I have just alluded, from his residence in Leeds—which is literally one great manufactory, subdivided into various departments of industry, places of refreshment, abodes varying in their comforts, according as the occupiers are masters, overseers, or workmen—has had favourable opportunities for observing not only the effect of different occupations on the human constitution, but also of different degrees of exertion. Some of this gentleman's conclusions in his work on *The Effects of Arts, Trades, and Professions*, are contrary to what might have been anticipated. For instance, wet, vapour, and changes in the humidity of the local atmosphere, appear not so detrimental to health as is generally supposed; in temperate persons these agents produce little injury. Sudden transitions from heat to cold, as experienced by smiths, iron-founders, and glassmen, are not productive of acute disorders. The exhalations from vegetable matter are not found uniformly injurious; but on this point the writer declines giving a decided opinion. The natural odours of manufactured vegetables, with the exception of coffee, are little noxious. Tobacco-workers do not sensibly suffer from the fumes of their material; and the crushers of rape and mustard benefit by the odours which these seeds exhale. Members of Parliament and persons of fashion will be gratified to learn that the influence of change in the hours of sleep is less than might be expected: millers, watchmen, and coachmen, are not sensibly affected by night-work. Horses, however, suffer from nocturnal labour, and men, too, I apprehend, unless the change, by perseverance, has been made habitual.

Some agents or circumstances connected with employments are favourable to health. Such are the animal exhalations to which slaughtermen, butchers, poulterers, fishmongers, gluemakers, buckram-stiffeners, tanners, tallowchandlers, curriers, and grooms, are exposed. Oil or grease applied to the skin is a preservative, as experienced in slubbing, carding, and piecening, in the woollen manufacture.

The chief agents included under the denomination of deleterious, or unfavourable to health and longevity, are, excess or deficiency of food, bent-sitting posture, long standing, great muscular efforts in lifting weights, steam, artificial heat, impure air, dust and gaseous impurity of the atmosphere, anxiety and mental application, long sitting, and delay of micturition, compression of the chest, bending of the head for long periods, close application to minute objects, as in watchmakers, engravers, tambourworkers, and dressmakers; poisonous substances acting through the skin, as lead, printers' type, and mercury; or on the eyes or ears, as scarlet-colour, lime-dust, and the noise of machinery.

Before the whole of Mr Thackrah's conclusions can be safely adopted as rules of life, it may perhaps be desirable he should test some of them by a more lengthened experience and wider field of observation. With the exception of this gentleman and Mr Kay of Manchester, hardly any medical person has applied himself to the investigation of a subject so important to humanity. One satisfactory result may, I think, be safely deduced from the inquiries of Mr Thackrah; namely, that there is hardly any employment which is not compatible with the enjoyment of tolerable health, when exercised subject to the three following conditions:—1. Moderate hours of labour, according to the greater or less exhausting nature of the employment; 2. Temperate, wholesome, and regular living; 3. Reasonable meal-times, and holidays occasionally, for purer air and exercise.

Next to keeping up the price of labour and the preservation of health, a cardinal point with the working classes is to establish and maintain a high standard of comfort and enjoyment in their habitations, clothing, and food; to eschew whatever brings them to the verge of existence, to their last resources in diet, dress, and lodging; and as casualties of health and fluctuations in employment are inseparable from every occupation, a provision should always be made, if possible, for periods of slackness, sickness, old age, and infirmity.

It is a disadvantage to the industrious orders that they cannot more easily adjust the supply of labour to the demand. When wages are depressed by competition for work, they are compelled to submit to coarser and scantier fare; and the danger is, that a mode of life at first repugnant to their feelings, and forced on them by necessity, may become habitual. Should this be the case, it is not likely they will make an effort to check the over-supply of labour which has caused their degradation; and as a lower rate of wages is found sufficient for their maintenance, an evil that might have been temporary is made permanent. This appears to be the condition of the Irish; their wages are under sixpence a-day, which their masters doubtless think enough for men content to live in mud-cabins and feed on potatoes.*

Labour, like gold and silver, can be made valuable by its scarcity only, and no other contrivance. All the acts of legislation, all the combinations and devices among workmen themselves, must fail in raising to a high price that which is redundant, which every where abounds, and which may be indefinitely, and by any one produced: we might as well seek to give a value to water or the atmosphere that surrounds us. A scarcity of the employed, and abundance of employers—

* Condensed from Mr R. Chambers's Life of King James, in Constable's Miscellany, 1830.

* Not only wages, but gifts, are often proportioned to a man's style of living. When James the First heard that Ben Jonson was living in great poverty in an obscure place in London, he sent him L.10 to relieve his necessities. Some of the courtiers remarking on the smallness of the sum, the king said it was enough for "a man who lived in *an alley*."

a population that follows, and not precedes, the augmentation of national wealth, is the great secret of popular amelioration. Without this, the advantages of increasing opulence civilization, and commerce, can never be participated in by the working classes; social improvements, in every shape, may advance over the land, but it will never touch the low and stagnant pool in which they are immersed.

As the high price of labour produced by scarcity of workmen, is the fortress that protects all their comforts and conveniences, they ought never to yield an inch of the "vantage ground," without dire necessity. The remarks of Mr M'Culloch on this point are dictated by sense and humanity, and well worthy of attention. "The example," says he, "of such individuals, or bodies of individuals, as submit quietly to have their wages reduced, and who are content if they get only the mere necessaries of life, ought never to be held up for public imitation. On the contrary, every thing should be done to make such apathy esteemed disgraceful. The best interests of society require that the rate of wages should be elevated as high as possible—that a taste for the comforts, luxuries, and enjoyments of human life, should be widely diffused, and, if possible, interwoven with national habits and prejudices. Very low wages, by rendering it impossible for any increased exertions to obtain any considerable increase of comforts and enjoyments, effectually hinders them from being made, and is, of all others, the most powerful cause of that idleness and apathy, that contents itself with what can barely continue animal existence."—*Principles of Political Economy*, second edition, p. 394.

The father of economical science had inculcated the same philanthropic doctrine. "Is this improvement," asks Smith, "in the circumstances of the lower ranks of the people to be regarded as an advantage, or as an inconveniency to society? The answer seems at first abundantly plain. Servants, labourers, and workmen of different kinds, make up the far greater part of every great political society. But what improves the circumstances of the greater part can never be regarded as any inconveniency to the whole. No society can surely be flourishing and happy of which the far greater part of the members are poor and miserable. It is but equity, besides, that they who feed, clothe, and lodge the whole body of the people, should have such a share of the produce of their own labour as to be themselves tolerably well fed, clothed, and lodged." —*Wealth of Nations*, b. i. ch. 8.

Government is interested not less than the people in the diffusion of such sentiments. It can never be the pride of authority to rule over an ignorant, ill-fed, and degraded population. The diffusion of political power has assimilated society to the nature of a joint-stock association, in which the rulers and ruled have a common interest. Government cannot be rich, while the body of the community is indigent; it cannot be safe, while that on which it mainly rests cannot be depended on for support. It is not the opulent who demand legislative attention; they are exempt from want, and as they assume to be educated, they ought to be exempt from crime; they form that part of the social waste which has been reclaimed and cultivated: but the poor, if not still in the wilderness, are only on its verge, and require to be brought forward by the application of those practical truths I have endeavoured to explain and enforce.*

SKETCHES OF POLYNESIA.

(Conclusion of first Article.)

THE following is the mode of *tatooing* the skin, so common amongst most savage nations, and practised to a great extent in the South Sea Islands. The operation is performed by regular professors of the art, and is a very profitable occupation. The dye employed is the kernel of the candle-nut, called by the natives *tiairi*, which is burnt to charcoal, and then mixed with oil. The tatooing-stick consists of a piece of sharp-pointed bone, fastened to the end of a small stick. Another stick, somewhat heavier, is used for striking the other in the process of perforation. The figure or pattern to be tatooed is first carefully drawn upon the skin with a piece of charcoal, and the performer, having immersed the point of the sharp bone in the colouring matter, which is a beautiful jet, strikes it smartly with the stick in his right hand, and thus inserts the dye into the flesh. This operation is attended with great suffering, and few of the natives can endure it so long as to have an entire figure completed at one sitting. The consequences of it, indeed, are frequently fatal. The chest is the part of the body most profusely tatooed, and the beauty and minuteness of the representations sometimes made are truly astonishing. "Every variety of figure," says Mr Ellis, "is to be seen here. Cocoa-nut and breadfruit trees, with convolvulus wreaths hanging round them, boys gathering the fruit, men engaged in battle, in manual exercise, triumphing over a falling foe, or, as I have frequently seen it, they are represented as carrying a human sacrifice to the temple. Every kind of animal—goats, dogs, fowls, and fish—may at times be seen on this part of the body; muskets, swords, pistols, clubs, spears, and other weapons of war, are also stamped upon their arms or chest."

Marriages take place at a very early age among the Tahitians—the females being seldom more than twelve or thirteen, and the males a year or two older. When not previously arranged by betrothment, very short courtship generally precedes the union of the sexes, as neither party have any backwardness in displaying their emotions towards each other. The marriage ceremony is an affair of great pomp, mingled, besides, with many observances of affecting solemnity. Amongst these was the practice of the young couple's parents cutting their foreheads with a sharp instrument, and mingling their blood together upon a piece of cloth at the altar, as typical of the extinction of all difference of rank, and of all animosity between the two families, as well as of the binding obligation of the union. Another was the placing of their ancestors' skulls, which are always carefully preserved, beside the young pair, thereby testifying their belief that the spirits of the deceased were witnesses of the agreement. Notwithstanding all this ceremony, however, the marriage tie is more frequently broken than observed—either party quitting their engagement upon any capricious freak or fancy.

There never were a people, we believe, more addicted to cruel, murderous, and exterminating warfare than the natives of the South Seas. They considered it, in short, the prime aim and occupation of life, and all their customs and institutions bore reference to it. Amongst other results, it was the chief cause of the practice of infanticide, which was directed chiefly against female children, as being unfit for war; and to such an extent was it carried on, that, when the missionaries arrived from England in 1797, the proportion of males to females was as five to one. Great preparations, by religious rites and human sacrifices, take place before setting out on the expedition, which almost always is with the determination of utterly annihilating their enemies, and is generally carried into effect either with one party or another. The harangues of the chief warriors on these occasions are described by the Rev. Mr Nott as being the finest displays of graceful and impassioned eloquence which it was possible to imagine. The barbarities formerly practised by the contending parties upon their captives were beyond every thing horrible. Some of them were generally roasted and eaten, and it is now clearly ascertained that cannibalism in general was a common practice among these remote islanders.

* From an able and unpretending little work, just published—"History of the Middle and Working Classes." London, Effingham Wilson.

SULLIVAN THE WHISPERER.

James Sullivan, who possessed the art of training the most furious horse, by being permitted to be alone with him for a short space of time, is thus recorded in the "Survey of the County of Cork," by Townsend, who justly remarks, that, although the following facts appear almost incredible, yet they are nevertheless true, as he was an eye-witness to them:—"James Sullivan was a native of the county of Cork, and an awkward ignorant rustic of the lowest class, generally known by the appellation of the *Whisperer*, and his profession was horse-breaking. The credulity of the vulgar bestowed that epithet upon him, from an opinion that he communicated his wishes to the animal by means of a whisper; and the singularity of his method gave some colour to the superstitious belief. As far as the sphere of his control extended, the boast of *Veni, Vidi, Vici*, was more justly claimed by James Sullivan, than by Cæsar, or even Bonaparte himself. How his art was acquired, or in what it consisted, is likely to remain for ever unknown, as he has lately left the world without divulging it. His son, who follows the same occupation, possesses but a small portion of the art, having either never learned its true secret, or being incapable of putting it in practice. The wonder of his skill consisted in the short time requisite to accomplish his design, which was performed in private, and without any apparent means of coercion. Every description of horse, or even mule, whether previously broke, or unhandled, whatever their peculiar vices or ill habits might have been, submitted, without show of resistance, to the magical influence of his art, and, in the short space of half an hour, became gentle and tractable. The effect, though instantaneously produced, was generally durable. Though more submissive to him than to others, yet they seemed to have acquired a docility unknown before. When sent for to tame a vicious horse, he directed the stable in which he and the object of his experiment were placed, to be shut, with orders not to open the door until a signal given. After a *tête-à-tête* between him and the horse for about half an hour, during which little or no bustle was heard, the signal was made; and, upon opening the door, the horse was seen lying down, and the man by his side, playing familiarly with him, like a child with a puppy-dog. From that time he was found perfectly willing to submit to discipline, however repugnant to his nature before. Some saw his skill tried on a horse, which could never before be brought to stand for a smith to shoe him. The day after Sullivan's half-hour lecture, I went, not without some incredulity, to the smith's shop, with many other curious spectators, where we were eye-witnesses of the complete success of his art. This, too, had been a troop horse; and it was supposed, not without reason, that, after regimental discipline had failed, no other would be found availing. I observed that the animal seemed afraid whenever Sullivan either spoke or looked at him. How that extraordinary ascendancy could have been obtained, it is difficult to conjecture. In common cases, this mysterious preparation was unnecessary. He seemed to possess an instinctive power of inspiring awe, the result, perhaps, of natural intrepidity, in which, I believe, a great part of his art consisted; though the circumstance of the *tête-à-tête* shows, that, upon particular occasions, something more must have been added to it. A faculty like this would, in other hands, have made a fortune, and great offers have been made to him for the exercise of his art abroad; but hunting, and attachment to his native soil, were his ruling passions. He lived at home, in the style most agreeable to his disposition, and nothing could induce him to quit Dunhallow and the fox-hounds."

CRIMSON CLOVER.

The following notice is extracted from the fifth edition of the Code of Agriculture, page 433, and its object is to bring into extensive use, as a field crop, a plant hitherto cultivated only in our gardens, as a curious and rather pretty looking annual:—"It is a subject of astonishment that this valuable plant (the *Trefolium incarnatum*) should not have been long ago introduced into this country, and cultivated on an extensive scale. If sown in autumn, after a crop of potatoes or other roots, it produces next spring a crop fit to be cut for soiling cattle, eight days earlier than lucerne, and a fortnight before red clover. Care, however, must be taken to have good seed, and not to sow it too deep. It produces two excellent crops in one year, the first of which should be cut as soon as it comes into flower, and the second will produce a considerable quantity of seed. From its early growth in spring, when other articles for feeding stock with advantage are so difficult to be obtained, it is likely to become a valuable acquisition to British husbandry." If this clover—the seed of which is, we believe, to be had in considerable quantity of the seed-merchants in this country—be sown in spring, it is considered that it will produce a full crop in Scotland in the months of July or August, and must be of great value to those on whose lands the common red clover does not succeed, or where the crop may have partially failed. It is proper to remark, that this is an annual plant, and therefore should only be employed in partial husbandry.

DANCING.

Dancing seems to have been reckoned, as well among the Hebrews as the Greeks, one of the first-rate accomplishments, and to have been associated not only with their poetry, but with their religious worship. Almost all the earliest Greek poets, as Thespis, Cratinus, and others, not only excelled in dancing, but taught it to freemen, or gentlemen, for money. Sophocles was one of the best dancers of his generation; he had a very handsome person, which he was fain to exhibit in the dance's grace-displaying movements: when his play of Nausicaa was acted, he not only danced, but played at the ball. With the Hebrews, dancing must assuredly have been associated with notions of dignity, otherwise it would not have been used in their most solemn worship: and yet the taunting rebuke given to David by his wife, presupposes, in her estimation, something of levity combined with that exercise. With the Romans, after their connexion with Greece, dancing was also deemed a high accomplishment. In the age of Cicero, the first men of Rome made a boast of their skill in dancing; as Claudius, who had triumphed; Cœlius, the enemy of Cicero; and Lic. Crassus, son of the celebrated Parthian Crassus.

DAFT SANDY MILLER.

Formerly, in Alloa House, there was a strange half-witted servant, of the name of Sandy Miller, whose principal business it was to attend to the coal bunkers or receptacles, of which there was one in every flat of that large mansion, for the supply of the fires. Sandy was sometimes negligent, so that the bunkers ran empty before he observed; and on such occasions he generally received such a dreadful scold, either from his master or from the other servants, that his life for the time was miserable. At length, Sandy was one day suddenly taken ill, and given up for lost, when a clergyman was sent for to administer to him the spiritual offices proper to a death-bed. Poor Sandy listened very attentively to what was said by the minister, and after prayers were over, mentioned, with a self-satisfied sigh, that there was *one thing in particular* which gave him great consolation in this his dying hour. "What may that be, Sandy?" said the clergyman. "Oh, sir," answered the dying man, "*a' the bunkers is filled!*"

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, No. 19, Waterloo Place.—Agent for Glasgow, JOHN MACLEOD, 20, Argyll Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by leaving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by WILLIAM ORR, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

No. 82. SATURDAY, AUGUST 24, 1833. PRICE THREE HALFPENCE.

NELLY BALLANTYNE.

NELLY BALLANTYNE was one of a class of persons to whom allusion was made in the article entitled "TURNERS"—a decent old widow, maintaining herself, in a creditable way, as the mistress of a small public-house in one of the villages near Edinburgh. Her lowly whitewashed hostelry was for many years a favourite resort of the lovers of fruit in summer, and the lovers of skating in winter, and *turners* all the year round. It was a great *Saturday house*—that is to say, a number of decent stoutish gentlemen who had offices in the Register House or the Exchequer, and did not get much abroad during the week, liked to come out to see Nelly on the afternoon of the last day of the week, which, after the manner of their ancestors, they always kept sacred to recreation. Nelly knew her men well enough, and having a neighbour who washed to some of them, was always timeously apprised, by means of that intelligencer, if it was likely that any of "the gentlemen" would be thinking of a sheep's head on Saturday—not that any decided order was ever given—far from it; only good Mr Baird of the Sasine Office, on receiving his bundle of fresh linen about the Thursday evening, would hint that he had not been taking a walk for a long time; he must really see and get one or two out with him, after the office shut on Saturday, and they would perhaps see what Nelly Ballantyne was about. Nelly knew, therefore, what it beseemed her to do; and if the sheep's head was not fully ripe in the pot by three o'clock, her stars were more at fault than she. Just at that hour exactly, the point of Mr Baird's stick, as he carried it swivel-fashion in his hand, would be seen coming round the corner, followed speedily by his own portly person, and a straggling group of perspiring friends, who carried a demand of spirits and water in their very faces, and one and all declared the roads to be remarkably dusty. If Nelly was not in the trance to receive them, she was sure to be in the spence; but whether present or not—without even the assurance that she was in the house, or in the world—the foremost of the party would say, with a curious singing accented voice, "Well, Nelly, how are ye to-day?" and so would push into *the* room, where the neatly spread table, with a heap of white plates rimmed with blue, a salt-foot of pewter filled with large-grained salt, and a stoneware pepper-pot, with a piece of paper twisted into the bottom of it, gave earnest of the coming fare.

Seldom had any party of this kind to wait long, when honest Nelly herself, dressed for the occasion in a clean white apron, and a new "toy" upon her head, would come in with the ample tureen, all as if she had previously learned the numbers and wishes of her guest by a kind of intuition. "Weel, Nelly, it's a gude head of course?" "Ye may say that, sir—a head far bye ordner. A grand black tup, sir—I waled him mysell frae amang a score—he had horns the like I never saw—the trotters just uncommon. I daur say, a dizzen might dine on him, ae way and another." No time for farther colloquy just now. But after the broth, head, and trotters, had been alike discussed, and just as Nelly was going to close the door for the last time, that her guests might begin to their toddy, worthy Mr Lothian, seeing her "fissling" a little before taking wing, would accept the hint for the fiftieth time, and say, "But, Nelly, ye maun take a taste yoursell—sit ye down there;" and so would hand her the first glass that was filled. Nelly would then take a seat in a skittishly condescending way, and drink all their healths by name; after which, Mr Baird, or Mr Paterson, or Mr Abernethy, would ask how she had been getting on lately, and what "gentlemen" had been out seeing her, and how, in particular, her "dochter Bell" was. Nelly would then tell them that she was "aye fechtin away, the best way she could, to keep a house aboon her head; but 'deed there hadna been muckle doing for a lang time. Except a dinner last Saturday," she would say, "twa-three gentlemen o' the Court o' Session [macers, probably, celebrating the commencement of the vacation]—we have not had ony visitors bye common this month past. The weather, ye see, has been gey backward, and gentlemen are feared to venture out this length. And I'm sure, last winter, it was just as ill the tither way; for there was never a day's gude ice on the loch a' the season, and except a gentleman that gaed down ower the head, and had to be brought in here to be dried, I dinna think we ever had either a skeytcher [skater] or a curler about the house. They say the Principal, honest man, was out *ae day*, but that was a'. 'Deed I think the seasons are gane clean gyte now a'thegither."

Some one would interject, that although there might be little doing about the village, still Nelly got the best part of it, while her rivals did not appear to be prospering very greatly.

"Ou 'deed ay," she would answer, "I've great reason to be thankfu'. Mony a ane tries 't; but somehow or other, nane o' them ever comes to ony gude. There's ane set up the other day on the other side o' the road, just forenent my very door—a chield that likes whisky himsell, and maybe thinks he'll at least mak his ain drink by 't. But I've seen them a' out as yet, and the auld widow will maybe see him out too."

Mr Lothian would remark, that she had now been a long time here in a way of business.

"Ay, saxteen years, sir, again' the neist Martinmas. I lost *him that's away* just the Lammas before, and there was nae other remeed for the bringing up o' five fatherless bairns but just to tak up the bit public. A' that time I've paid baith licence and taxes, and never been ahint five pounds to the merchant; and that's mair nor some o' my neebours can say."

In this kind of chat would Nelly amuse her guests for a few minutes, and then, pretending to hear something going on which required her attention, would bustle away out of the room, and leave them to the serious business of the evening.

Mine hostess daikered on (to use her own phrase) for many years in her quiet and decently conducted hostel, paying scot and lot, and seeing one after another of her rivals sink into ruin and oblivion. There was hardly a clerk in any public office in Edinburgh who had not agreeable recollections of cheap and savoury treats enjoyed in her house on Saturday afternoons; and it was curious to remark, that, although she would have been a total stranger to these gentlemen if met on the streets of the city, every one was her familiar friend when they entered her own house. This, be it observed, did not arise from any thing like haughtiness on their part: the actual fact was, that Nelly was part and parcel of a particular scene with which they were familiar, and, if seen any where else, her figure would not have been recognisable. In some instances, however, she might be said to have established something beyond this holiday kind of friendship. By her neighbour, Betty the washerwoman, she had perhaps sent a present of gooseberries now and then to Mrs Baird, or to Mrs Lothian; and although these worthy ladies never thought of calling to render their thanks in person, they would perhaps send the nursery-maid some day with her infantine charge, to take a walk that way, and pay Nelly a visit in passing. The consequence would be, that when the gentlemen next came to a Saturday dinner, she would burst out with—"Eh, Mr Baird, hoo muckle am I obleeged to Mrs Baird, for sending yon bonny bairn to see me. Sic a bairn I never saw—sic fine black een (like his mother's, I fancy), and how stoot for his age! Only eleven months and ten days, the maid said, and him nearly gaun his lane already. Eh, sic a fine bairn!" Thus familiar with her respectable guests, Nelly might rather be called their friend than their hostess.

Times at length changed with this poor, but decent and honest woman. Severe as her struggle had been to bring her orphan family over the helpless period of childhood, she found that it was only when they grew up to maturity that they became seriously burdensome to her. The eldest lad—Matthew by name—had always been her favourite, and, spoilt by indulgences he did not deserve, turned out a very bad member of society. Originally apprenticed to a cartwright, he gradually sunk, through a great variety of employments, into the condition of an absolute profligate; associated with the most flagitious characters in the neighbouring city; was noted in the newspapers as one who called for the especial notice of the police; and every now and then came home to his mother to oppress her with his exactions, and wring her heart with his misconduct. James—the second son—was in every respect a superior character; had been a good scholar, and recommended himself, by his talent and good behaviour, to a respectable situation as a clerk; but, falling out of employment, and being disgusted with his brother's conduct, which threatened the whole family with disgrace, he had been induced to emigrate to Canada; nor did his mother hear of him for several years after, so that he was, to her, the same as if he had ceased to exist. The remaining children of the poor widow were daughters, all of whom, at a proper age, had been sent to act as house-servants in the neighbouring city. Such is the condition of life which presents itself to poor parents in general, as the only resource for the female part of their families; though it is one not without its hazards and its disadvantages, and is generally encountered with some share of hesitation. So far as the mere duties of service are concerned, it is not perhaps looked upon with any trouble of mind; for the general lot is one of mutual subserviency, and it is only appropriate to the condition of the poor that their share of that lot should refer to humble offices in the households of the rich. There are other circumstances, however, attendant upon this condition, which no parent possessed of good feeling and good principle can regard without fear and real distress. He knows that the very creatures whom he looks upon with such fondness and estimation, whom he has taken pains to instruct in every upright principle, and whose temporal and eternal interests are alike so dear to him, are liable to be contemplated in the station to which he is forced to consign them, as only the fit ministers of unworthy pleasures, as creatures who come no one knows whence, and go no one knows whither, mere accidental and unconnected beings, responsible to no one for their fate, and for whose conduct there is no heart either to grieve or rejoice. He thinks of the miseries to which they are thus exposed, and the anguish which they may soon perhaps bring back upon himself, and, though not unhopeful of better things, sees them depart for their gayer and more dangerous home, with a regret and an alarm which, if it could be but imagined by those whom he dreads, would perhaps be the best protection of those whom he wishes, but is not able, to protect. Such were, in part, the feelings of honest Nelly Ballantyne, when she sent her three daughters to "serve

the fremmit"* in Edinburgh; and they were not unjustified by the event. The youngest and the fairest —"Bonnie Lizzie," as she had been called—became a waif and an outcast; while, of the others, only one could be considered as fortunate. This was Helen, who was married to a steady operative in the city, and became the mother of a large family, which, by economy and industry, she maintained in a creditable manner. The other daughter, Bell, was also married; but her husband proved a worthless sot, and, after having had three children, she found it absolutely necessary to separate from him, and take refuge in her mother's house. Thus, honest Nelly, after having, as she thought, got over the grand difficulty of her life, namely, the rearing of her orphan family, found herself, at an advanced age, more deeply and distressingly burdened than ever. Her son Matthew was a *downdraught* of the most odious kind—a monster who would coolly demand money from her, in order to save him from the consequences of criminal acts, which he described himself as having committed, and then go away to spend what he had thus wrung forth, in the basest indulgences, and amidst a troop of companions who were every now and then thinned by the law. On the other hand, Nelly was taxed with the entire maintenance of her daughter and grandchildren—it being impossible for the poor mother, occupied as she was with the care of three infants, to do any thing for her own or for their support. There was something not far removed from real pathos in the reflections which she occasionally indulged in respecting these circumstances. "I would think naething," she remarked one day to a friend, "of gieing Bell and her bairns a bite o' what I hae, if I could weel afford it—for bluid, ye ken, is aye thicker than water, and the bairns, puir things, are fine creatures, for a' the ill father they hae, and it's just a pleesur to me to see them totting about, crying, 'Grannie, do this,' and 'Grannie, gie me that,' and no an ill thocht i' their heads. But oh, woman, its a different thing wi' Matthew and Lizzie. I used to think, when their father left them a' young upon my hands, and the youngest no born yet, that few women had ever been trysted as I was; and mony a time did they anger me wi' their childish mischief, and broken lozens, and that kind o' thing. But though they angered me then, they never vexed me, as some o' them do now. If they could a' but be made bairns again—innocent thochtless bairns, dirtying themselves in dubs, and greeting for pieces,† and whyles gieing ane another a lick i' the lug‡ when they provoked ane another—I wad care little, woman, though they were twice the burden to me that they were langsyne."

It was soon found that the increased expenditure, occasioned by these new exactions, was pressing too severely upon the resources of the honest widow; and the consequence was, her inability to pay the rent, taxes, and licence, which formed her principal channels of disbursement. That unjustly but unavoidably detested race of men, the tax-gatherers, became her frequent visitors; and though pity, aided by a dram, would for a while induce them to write some decent excuse on the back of the returned receipt, and so depart in peace, this could not be effectual for ever. The horrid sum—two pounds fourteen shillings and sevenpence—still remained due, and still, once every week, re-appeared the awful officer at the door, with his small black leather portfolio, and his really unassuming, but, to Nelly's perceptions, most imperious and tyrannical countenance. "Ou, mistress, ye ken it's no my blame," the poor man would say; "I maun just do as I'm bidden." But Nelly, though her reason assented to this proposition, always found her feelings of quite a contrary opinion; and even while she invited the man to a civil glass of whisky, and wheedled him for yet a little more time, could not help thinking in her secret heart, that he was the most atrocious villain on the face of the whole earth. "Weel, mistress," he at length told her one day, "this off-putting will do nae langer. There's five per cent. on already, and my expenses beside, and I hae na a receipt sae scrawled on the back in my hale pocket-book. First, ye see, 'seventeenth May, says call again;' then, 'twenty-sixth May, has no money;' next, 'June second, will call in a day or two herself;' then again, 'June ninth, has just been paying a large account for porter;' after that, 'June fifteenth, says call again next week;' then cam on the expenses, and after a', 'July sixth, has not a shilling in the house.' Really, mistress, I've haen mair trouble about your taxes than ony other body's in the district; and, I assure ye, it's nae joke coming out a' this length in sic warm weather." For this time, Nelly got clear of her dun at the sacrifice of a bottle of strong ale. But at length the laws of the collectorate could be stretched no farther, and a poinding or execution took place in her house, with assurance, that, if the taxes should not be settled before Tuesday next, her effects should be exposed to sale.

The intermediate time was spent by the poor widow and her daughter in unavailing grief; and, not having a single friend in the world to take her part, or rescue her from so dreadful a calamity, she could only look forward to destitution both for herself and the helpless creatures depending on her. The terrible day came round in course, when duly appeared a band of officials to execute the threat which hung over her. A red flag was displayed at the door, which speedily had the effect of collecting the villagers; and a barrel having been placed by the side of the threshold, the auctioneer mounted aloft, and began to sell the articles of furniture, which, one after another, were brought forth from the interior. Poor Nelly and her daughter remained within, dissolved in grief, which the efforts of a few female neighbours, however well meant, could do little to control. The children moved about as usual; and it was curious, amidst one of the most distressing scenes that can be witnessed, to hear their unconcerned prattle, which ever and anon was mingled with the coarse declamations of the auctioneer without, and the heart-bursting sorrow of the party within. Once, only once, could Nelly venture to peep abroad upon the proceedings out of doors; she saw her cradle raised aloft for sale—the ancient and familiar cradle in which she had been herself rocked, which had nursed her own family, and was now or lately employed for her daughter's youngest child—and she shrunk back as if she had received a blow, and again buried her face in her lap by the fireside. In time, the dreadful scene was finished; and she was left in her desolate cottage, with only one or two stools, and other little articles, which had been judged too trifling to be put up for sale. The coarse officials departed with the proceeds of their severity, leaving ruin and misery where there had formerly been humble content and cheerfulness.

For some time after this calamity, Nelly and her daughter took up their abode with a poor neighbour, and endeavoured to obtain a slender support by acting as washerwomen. They were also indebted, in some small measure, to the kindness of that daughter who has already been alluded to, as the only one whose lot proved in the least enviable. In the declining strength, however, of the old widow, and the duty of attending to so many children, which pressed upon her daughter Bell, all such means of support would have soon proved ineffectual, and the whole family would have speedily become objects of public charity, if it had not been for the providential re-appearance of Nelly's long-lost son James. This young man had at the first proved so unsuccessful in his object, that he could not prevail upon himself to write about his affairs to his mother. At length, however, he had become settled in an excellent farm in the London district, in Upper Canada; and having heard of the unfortunate circumstances of his mother and sister, he had resolved to pay them a personal visit, and, if possible, prevail with them to accompany him to America. It would be vain to describe the joy with which Nelly hailed the appearance of her son, or the surprise she expressed at his improved circumstances. She very characteristically made no objection to undertaking so long a voyage at her advanced time of life, but only remarked, that "the bairns couldna steer a step till they got new sarks." All such difficulties, it may be imagined, were soon got over, and in a few weeks this persecuted little family found a safe retreat on the other side of the Atlantic. According to the last accounts, they were all living in a comfortable and happy manner, and Bell's family was beginning to be of no little service to their uncle. Nelly hardly liked the country at first, but soon became reconciled to it —one grand consideration moving her thereto, being (as she herself expressed it) that "there was nae fear *here* o' being roupit out for taxes!"

* Unrelated, not akin.

THE YOUNG CHEMIST—No. II.

Caloric, or the cause of heat (from the Latin word *calor*, heat), is spread universally over the surface of the globe. But whether it is a real tangible substance, or only an attribute or property of matter, is not very easy to determine. If it be an agent or real substance, it is of that active and subtile kind which almost eludes detection; it passes through and along all bodies, and we can scarcely tell from whence it comes or whither it goes. What we have to consider, then, is its effects, or what it produces. There can be no doubt but that the great, and perhaps the only way by which heat comes to us, is from the sun. Were it not for the daily return of the sun's rays to the earth, every thing on its surface would be speedily congealed to a frozen mass of solid matter; we could have no liquids, and even the air itself would be reduced to a mass, first of fluid, and then of solid matter. It is thus, that, in winter, with our short day and slanting sunshine, we have the earth cooled down at night to freezing, and often below, so that the powers of next day's sun are too feeble to produce a thaw; thus, also, even during our longest summer days, the coldest period of the twenty-four hours is the hour immediately preceding sunrise.

But there are other means of producing heat besides obtaining it directly from the sun. Thus, if two pieces of wood are rubbed smartly together, they soon become hot, and at last burst into flame. In this manner savage nations frequently procure a precarious fire; and the dry branches of the forest, when thus rubbed violently against each other by the wind, not unfrequently take fire, and set the country in a blaze; and the wheels of carriages by a similar friction are often destroyed. Even if two pieces of ice are rubbed together, as much heat is generated as serves partly to melt them into water. Violently beating a hard substance has the same effect in producing heat as friction; and thus, if a piece of soft iron be taken, and smartly hammered, it will become red-hot under the operation. The next way by which heat is produced is by mixing substances of different properties with each other, by which a chemical change in their natures is brought about, and more or less heat is thrown out. Thus, if you take half a glassful of oil of vitriol, and pour on it the same quantity of water, and mix them suddenly, the outside of the glass will become so hot as scarcely to bear touching with the finger; and if a small slice of phosphorus (a very inflammable substance) be rolled in a little tow, and placed outside the glass, a flame will immediately be visible. If you take a piece of fresh burnt limestone, and pour over it some water, so great a heat will be raised as to convert part of the water into steam, at the same time that the rest is absorbed or taken up by the lime, and becomes a solid.

Another way in which heat is produced in great abundance, is by combustion, or the act of burning, as in a common fire of coals or wood, or a lamp or candle. This, too, is a chemical combination, or mixture of oxygen (one of the airs of the atmosphere) and the inflammable substance, as wood, oil, or grease. Without a constant supply of this air, no lamp or fire would burn; and in a large fire in a grate, a rushing current of air may be perceived continually going to feed the flame. It is by a knowledge of this circumstance that grates are constructed with a contracted passage to increase this current, and that a long and narrow glass is placed over the flame of a lamp, preventing the air from getting to the flame on all sides, except from below, where it rushes up in a strong current, and heightens in this way the intensity and brilliancy of the flame. In all those instances where heat is accumulated and produced from the mixture or combustion of bodies, it must not be supposed that this heat is actually raised or generated at the time—it is only the heat which these bodies have received from a common source (in all likelihood from the sun), that has by certain means been drawn from those bodies, and concentrated to one point.

We shall next consider what effect heat has on bodies. The most striking influence of heat is, that it expands or increases the bulk of all bodies, whether solid, fluid, or aërial; and it effects this by separating to a greater distance the several minute particles of which bodies are made up. To understand this better, let us take four or five small peas or marbles, and place them close to each other, as close in fact as they will go, and draw, with a piece of chalk, a circle around them, of about half a foot in width or diameter, and another smaller circle of six inches diameter. This, we may suppose, is a state of matters where there is no caloric or heat present at all. A small portion of heat admitted will separate these balls, and make them occupy the space contained within the smaller circle. Suppose a greater quantity of heat admitted, a greater separation between these balls will take place, and they will then occupy the space of the larger circle. Thus it is with the expansion of bodies; and this is brought about by the smaller or greater degree of heat which any substance contains. If you take a piece of iron, and measure it while cold, and then heat it to a red heat in the fire, you will find that it has lengthened considerably by the addition of heat, and in this way cartwrights turn the circumstance to good account. Having prepared the woodwork of their wheel, and the iron rim, the latter of dimensions so scrimp as not to enter over the wood, they heat the iron in a furnace; this expands or increases the size of the circle so much, that, when laid over the wooden circle, it easily fits on it; cold water is instantly dashed on the iron; it suddenly cools, and contracts and grasps firmly the wood in every part throughout. If you take a common bladder, and fill it half-full of air, and then tie it up tightly with a thread, and hang it before a good fire, the air in the bladder will gradually expand, so as to fill the bladder completely; and if the heat is continued, the force of the expanding air will be such as to burst the skin with a loud explosion. Water, too, and every liquid, increases its bulk by being heated; and a goblet of water, not nearly full, when put on the fire cold, will, when it boils, be found to have increased to the very brim. On this law of bodies depends the formation of the thermometer, an instrument, as its Greek name implies, constructed to measure degrees of heat: it consists of a glass tube, with a hollow inside, and a bulb on one end: this bulb, and part of the tube, is filled with spirit of wine, or quicksilver; and, as the surrounding heat is great or small, the fluid, as it expands or contracts, rises or falls in the tube.

We have already mentioned, that all bodies on the earth's surface contain a portion of heat, which they are daily receiving from the sun's rays; and this heat or caloric is of so benevolent and impartial a nature, that wherever it is, or under whatever circumstances, it will have a tendency to diffuse itself equally through all bodies. Thus, if a piece of precious gold and vile copper are in company with a piece of red-hot iron, the heat will go equally to the gold as to the copper, and, indeed, equally to every thing around. If a king and a beggar were together, they would be both warmed in an equal proportion: in short, heat, un-

like many worldlings, is no respecter nor despiser of persons or of things. But it will be said, in a room for instance, if we place one hand on a piece of wood or cloth, and the other on a piece of polished brass or steel, that the metal feels infinitely colder than the cloth or wood; and so it does, because some substances, and especially metals, are better conductors of heat than others; so that, although the metal is not colder than the wood, yet it has the knack of taking the heat out of your body ten times quicker, and conveying it to its brother metals and wood in the room. We every day take advantage of this. For instance, soft woollen clothes, because they are imperfect conductors, are much warmer than linen or cotton, and infinitely more so than a metallic covering would be. The handles of our tea-pots are made of wood instead of metal, because metal would conduct heat from the hot tea so quickly and perfectly as to burn the fingers, whereas wood is more slow and sluggish in its operations.

But heat has another way of communicating itself, besides passing from one solid body to another If you sit at the farther end of a large room, but directly opposite to a good fire, you will find the heat glowing in your face, and coming at once from the red fire. This is called the radiation of heat, or its passing in direct rays. Heated bodies, though not visibly red-hot, can radiate or send off heat in this manner; and it is supposed that the heat from the surface of the earth thus passes off during the absence of the sun into empty space, otherwise, from our constant additions of the sun's heat, it would accumulate too much on our globe.

There is another circumstance regarding heat which cannot be passed over, and that is, that it enters bodies in very considerable quantity, and yet cannot be perceived; that is, it makes them not a bit hotter. Thus, if a quantity of ice be put into a pan, and melted by applying heat, it will be found that the melted water is just of the same temperature as the solid ice was when put into the pan, although long application of heat had been used in the process of thawing. If this water be heated for an hour longer, it will arrive at the boiling point; and if the heat is continued for six hours more, it will be all converted into steam. Yet this steam is just of the same temperature as the boiling water, although it must have taken in a great deal more heat than the water. This heat taken in, but not manifest to the senses, has been called latent caloric; and it is a law of bodies, that, before they can pass from the solid to the fluid, or from the fluid to the aëriform, they must have an additional quantity of caloric. The same law holds if we reverse the matter. Bodies in passing from a state of air or vapour to a liquid, or liquids passing into solids, give out a quantity of heat, and this heat given out is found to be in exact proportion to that taken in under the other circumstances. It has often been remarked, and is a well-known fact, that before and during a fall of snow the air feels warm; this arises from the heat given out by the water consolidating into snow flakes. On the contrary, there is no time that the surface of the ground is more chill than during a thaw, because the melting snow greedily absorbs heat from every object around. Evaporation, or the sudden passing off of fluids in vapour, also causes great cold: thus, if a thin glass ball, containing a small quantity of water, is repeatedly moistened with a rag on the outside, containing ether (an extremely volatile substance), the water will congeal into ice, by its heat being carried off in the evaporation of the ether.

We have now finished all that we propose saying about heat, and, before concluding, intend to note down a few experiments connected with the subject. In experimenting, however, we would caution the young chemist to be much upon his guard, and to observe one or two things. He should never be in a hurry, but well consider his mode of proceeding, and overlook, again and again, his materials and preparations; he should observe neatness, and order, and cleanliness, for these will undoubtedly lead afterwards to accuracy and precision; he should never poke his face or eyes too near any chemical materials; he should put on a pair of strong gloves to protect his hands, and a mask for his face, when an explosion is likely to occur. In exploding the gases, &c., he should roll a coarse towel round the glass phial or jar; and if it breaks, it will do no injury. Finally, he should make his experiments as much as possible useful, that is, illustrative of some circumstance in the science, not the idle frolics of a mountebank. We shall give the chemical names of ingredients, which, though they may seem mystical, will be readily known at the chemist's laboratory.

1. *To produce flame under the surface of water.*—Take a small slice of phosphorus, and three or four grains of oxymuriate of potass; place these at the bottom of a glass tumbler; then take a glass tube with a pretty wide hollow in the middle; dip one end of this into a little sulphuric acid, and then press the thumb smartly on the other end, so as to exclude all air; lift up the tube gently, which will contain a few drops of the acid, and slip it into the tumbler just over the ingredients at the bottom; remove your thumb from the top; the acid will fall down, and, decomposing the oxymuriate of potass with great heat, the phosphorus will inflame and burn brightly, supplied by the oxygen of the oxymuriate.

2. Take a small bit of the metallic potassium; throw it on a piece of ice, or a little water, and it will burst into a beautiful blue flame.

3. *Detonating powder.*—Take three drachms nitre, two of carbonate of potass, and one of sulphur; mix them together in a mortar. Take about as much of this powder as can be held on a sixpence, and place it on a shovel over the fire. It will first melt, and then explode with a loud noise. The explosion is caused by a quantity of oxygen gas being suddenly disengaged from the nitrate of potass.

4. *Coloured signal lights.*—Take six drachms nitre, and two of sulphur; mix them into a fine powder. To produce a white light, add to this powder one drachm of orpiment, or yellow arsenic;—a blue light, two drachms of crude antimony in fine powder;—a red light, one drachm of nitrate of strontites.

SKETCHES OF POLYNESIA.

(Second and concluding Article.)

Upon the first establishment of one of the Missionary Societies, in 1795, the then newly-discovered islands in the South Sea were selected as the first scene of its exertions; and thirty individuals, who volunteered their services, engaged to attempt the establishment of missionary settlements in the Society, Friendly, and other islands of the Pacific. At this period, the native inhabitants were under the thraldom of a barbarous mythology, combining in its tenets almost every extravagance which characterised the idolatrous systems of the heathen nations of old. The air, earth, and sea, were in their estimation peopled with spirits and deities, good and bad, to whom they indiscriminately offered up idol-worship and human sacrifices, while, as stated in our previous article, infanticide, torturing of war-captives, and every other barbarous practice common to savage nations, were in full operation. Eighteen of the missionaries landed at Tahiti, in March 1797 (the rest being distributed among the neighbouring islands), and were received by the king (Pomare) and queen of the island with uncommon respect and kindness. Unlike the jealousy usually manifested by barbarous tribes towards foreigners, the natives of Tahiti were delighted at the prospect of the white men coming to reside amongst them, having conceived a favourable opinion of them from the passing visits of various English ships. So pleased were they at the circumstance, and so hopeful of the advantages that would accrue to themselves from the permanent residence of Europeans, that they voluntarily ceded in a formal manner to the missionaries a whole district of the island called Matavai. Such transactions were by no means uncommon amongst them; but there was always a tacit understanding that the *presentee* (sometimes of a whole island) was only to make use of the gift so far as was needful to his support. A few of the missionaries were conveyed to the neighbouring islands, where they were likewise received with the utmost cordiality. Their acquaintance with the mechanical arts, for the practice of which they had brought with them all sorts of handicraft tools, especially struck the natives with astonishment and delight, and at once conciliated their respect and friendship. After having by these and other means established themselves in the good opinion of those they came to instruct, the missionaries next proceeded to acquire a knowledge of the Tahitian tongue. In this they found such great difficulty, from the language being altogether oral, and the multiplicity of vowels used, that they would probably have given it up in despair, but for the pains which the natives took to instruct them. With this aid, they were enabled, after great labour, to reduce the language to writing, which not only was of the highest use and importance to the missionaries, but afterwards came to be used by the natives themselves with the utmost facility. When a suitable means of communication was thus established between them, and after the missionaries had been about a year in the island, the latter requested a public meeting with the king and principal chiefs, at which they informed them of the purposes of the mission; namely, to instruct them in all useful arts, teach them reading and writing, and make known to them the only true God, and the way to happiness in a future state. They likewise, at the same time, endeavoured to demonstrate the horrible nature of human sacrifices, and especially of infanticide, and strongly urged their immediate discontinuance. The chiefs and people appeared pleased with the explanation of the missionaries, and promised that no more children should be murdered; but it was only a promise.

At this time there were two rulers in Tahiti—Pomare, and Otu his eldest son. But although the actual sovereignty of the latter was confined only to a few districts, he in fact possessed more power than his father, and was termed the king, notwithstanding that Pomare was recognised as the chief of the island. Otu, who afterwards, on his father's death, assumed the name of Pomare the Second, was at first greatly prejudiced against the missionaries, and it required all his father's influence to prevent him manifesting his aversion otherwise than by words and looks. His unfriendly disposition towards them was so well known, that some of his adherents upon one occasion attacked four of the missionaries, tore the clothes from their back, and would undoubtedly have drowned them in a river into which they threw them, had not some of the more friendly-disposed natives rescued them. The good king Pomare was so incensed at the conduct of the assailants, that, notwithstanding the earnest entreaties of the missionaries, he made war upon the district, and slew two of the ringleaders. The impression, however, of this unpleasant occurrence upon most of the missionaries was such, that eleven of them took their departure in an English vessel then lying at Tahiti, and proceeded to Port Jackson, in New South Wales. This step seems scarcely to have been warranted by the occasion, more especially as a great majority of the natives expressed the deepest sorrow at their resolution, and the good old king entreated them, with tears in his eyes, to remain. It seems doubtful, however, if their presence would have been productive of any good results at this time in Tahiti—at least, for many years afterwards, the missionaries laboured on indefatigably without the slightest appearance of success to their cause. For this there were many evident reasons. In the first place, a rebellion broke out amongst the natives, about the above period, by which the island was kept in a continual state of turmoil and agitation. Another reason, no doubt, was the disfavour in which the preachers were held by Otu and the other chiefs. A third was of a still more distressing and unfortunate character. From the number of English vessels, principally South Sea whalers, which then began to touch at the islands, some loathsome diseases had been introduced amongst the natives by the seamen, which rapidly spread, and produced the most calamitous effects. It was not to be wondered at if this circumstance operated strongly to the prejudice of the missionaries, as being the countrymen of those, who, according to their simple belief, had brought such a fearful judgment of the gods upon them. When the missionaries, too, proceeded to address the people on the inestimable benefits of Christianity, they were always met by the obvious question—why no mention had been made of the importance of this new religion by any of the former British vessels which had touched at the island. The king of England, they said, had sent them presents and professed friendship, but none of his messengers had ever before spoken of the Christian faith. Singularly enough, however, many of the natives regularly attended public worship at the mission-house, uniformly observing the strictest attention and decorum. For the better accommodation of these still profitless hearers, as well as with the view of inducing the attendance of more, the missionaries reckoned it expedient, in 1800, to erect a special place of worship. Towards this object Pomare lent workmen and every other aid in his power, and the chiefs contributed most of the materials. It is worthy of remark, that this was the first public place of Christian worship erected in the South Sea islands.

We have mentioned above, that a rebellion broke out in the island soon after the departure of some of the missionaries for New South Wales. The occasion of this event was the removal, by some of the chiefs, of the national idol, Oro, from the district of Pare to that of Atehuru, without the king's consent. Otu and Pomare followed their god, and, after the performance of the great marae, or national sacrifice, at which all the chiefs or warriors of the land were assembled, they stated that they had received intimation that Oro wished to be conveyed to another residence, and requested him to be delivered to them for that purpose. This the Atehuruan chiefs resisted. The consequence was, that Otu with his followers seized on the idol by force, and carried it off to sea in their canoes. This was the commencement of instant hostilities. The Atehuruans invaded the neighbouring districts, slaying and burning all before them, and finally succeeded in defeating the army of Otu in a pitched battle, retaking the object of contention, and remaining masters of the greater portion of the island. By the aid of some British sailors, however, belonging to one or two ships lying at Tahiti, Otu was enabled to turn the tide of fortune against his enemies, and suppress the insurrection, besides recovering the idol. In 1803, the old king, Pomare, died suddenly, and his death was severely felt by the missionaries in more ways than one. Although he only manifested the greater aversion to the object of their mission the more he understood it, he had treated them with uniform kindness, and, shortly before he expired, recommended them strongly to the protection of his son. His death served but to confirm the people in their superstition, for they attributed it to the vengeance of the gods for his unceremonious seizure and abduction of Oro at Atehuru; and upon the occasion of a religious ceremony, wherein his departed spirit was invoked, his wife Idia, and one of the priests, severally declared that he had appeared to them—which story was of course universally credited.

Meanwhile, as peace continued, the missionaries pursued their labours incessantly, making occasional tours through the island, and preaching the gospel to the natives; but although they could not as yet boast of making converts, they succeeded in inducing many to learn reading and writing, and opened a school for that purpose in Matavai, for the instruction of children. In 1807, the war again broke out between Otu, now called Pomare, and some of his chiefs, when the missionaries, being apprised by the king of their danger, and seeing

no chance of farther usefulness in the island, determined to leave it. They therefore sailed in an English vessel, which happened opportunely to call at Tahiti, and were conveyed, some to the neighbouring island of Huahine, and others to Eimeo. Those in the latter place were soon joined by Pomare, who had been compelled to fly from Tahiti, after being completely routed. From the melancholy prospect before them—their expulsion from Tahiti, the total destruction of their settlements, and the prospect of continued war—the missionaries resolved to remove to Port Jackson by the first opportunity, and, on October 26, 1809, they all sailed from the islands, excepting a Mr Hayward, who remained at Huahine, and Mr Nott at Eimeo with the king, thus abandoning the object for which they had laboured for twelve years, without the consolatory reflection of having in any sensible degree furthered their cause.

SCOTTISH LAKES.

LOCH LEVEN.

Among the various Scottish lakes, whether situated in the midst of soft sylvan scenery, or overhung by the dark huge masses of Highland hills, none are more worthy of the visit of the northern tourist than Loch Leven—not the salt-water loch, or arm of the sea, on the west coast of that name, but the pretty little lake in the Lowlands, which abounds so much in historical associations, and which is situated at but a short distance from the Scottish capital. This beautiful sheet of water lies in the shire of Kinross, about twenty-seven miles in a northerly direction from Edinburgh, on the road to Perth, and, in dimensions, extends from ten to eleven miles in circumference. It is of an irregular oval figure, and, possessing several islets, as well as being surrounded with scenery of a pleasing or imposing kind, it is justly deemed one of the many places in Scotland worthy of a visit from tourists. On its west and north-west side it is environed by the beautiful vale of Kinross, surrounded by hills in the distance, and in the foreground disposed in plantations, arable and pasture fields, pleasure-grounds, and other materials of rural beauty. On its margin, on the same side, lies the ancient town of Kinross, with the adjacent gardens and mansion of Kinross-house, the seat of Bruce of Kinross. A short way east from thence, on the shore, stands the ruined castle of Burleigh. On the north-east corner of the lake it is overhung by the abrupt western termination of the Lomond hills, and on the south-east it is similarly shadowed by the hill of Binarty. In the space betwixt these elevations the lake has leave to stretch towards the east, and in this direction is bounded by a perfectly level piece of carse ground, extending fully three miles in length by nearly a mile in breadth, which is bounded on the north by the west Lomond, and on the south by the low hill of Balbedie: Through the intermediate carse flows the river Leven, which issues from the lake. At the east end of the carse, the rising grounds almost close, and from signs which cannot be mistaken, it is, we think, evident that this was once the eastern termination of the lake, and that at an early period, by accident or design, its embankments being broken down, the present alluvial carse was left in a marshy condition, while the water receded to its lowest level in the western hollow. If such was really the case, it must have happened at a period much earlier than the dawn of record, for no tradition exists regarding it; and we know that in the Celtic age there were localities existing on the present eastern borders of the lake, as is signified by their appellations. The chief islands in Loch Leven are two in number, namely, one situated near the shore opposite Kinross, on which are the picturesque ruins of a castle, once dignified by the compulsory residence of the hapless Mary Queen of Scots, and another of a low bare appearance called St Serf's Isle, near the east end. Loch Leven and its islands make a very early appearance in Scottish history. Of the religious house, which must thus have been planted here upwards of a thousand years ago, only a fragment, sufficient to make a small pen-fold for cattle, is now to be seen. The island being low and verdant, supports a few sheep and cattle. The island which contains the castle is about two acres in extent, and it is said that a fortlet was first built here by Congal, son of Dongart, king of the Picts. In the wars which harassed Scotland during the minority of David the Second, the castle of Loch Leven was held in the patriotic interest by Allan de Vipont, against the troops of Edward the Third, who acted in behalf of Edward Baliol. John de Strivilin blockaded it, erected a fort in the churchyard of Kinross, which occupies the point of a neighbouring promontory, and, at the lower end of the lake, where the water of Leven issues out of it, it is said that he raised a strong and lofty bulwark, by means of which he hoped to lay the castle under water, and constrain Vipont to surrender. The water continued to rise daily, and the besiegers thought themselves certain of success, when the English general and most of the troops having left the camp to celebrate the festival of St Margaret at Dunfermline, the besieged, seizing the favourable opportunity (June 19, 1335), and, after much labour and perseverance, broke through the barrier, when the water rushed out with such impetuosity as to overwhelm the English encamped on that side.

Loch Leven Castle was granted by Robert the Third to a branch of the Douglas family. Sir Robert Douglas of Loch Leven, in the middle of the sixteenth century, was the near kinsman of the famous James Earl of Morton, and stepfather to the equally famous Earl of Murray; on which account he was selected by the confederated lords who seized Queen Mary at Carberry, as a proper jailor for that unfortunate lady. She was here placed in durance, June 16, 1567. On the ensuing 24th of July, she was obliged by a party of those statesmen to sign an instrument resigning the crown to her infant child, who accordingly was inaugurated a few days after at Stirling, under the title of James the Sixth. Queen Mary escaped from the castle, May 2, 1568, through the aid of a young relation of the family, and is said by tradition to have landed at a place called Balbinning, at the south side of the lake. She was defeated a few days after at Langside, and obliged to fly to England. The Earl of Northumberland, after his rebellion in England, being seized in Scotland, was confined for three years in Loch Leven Castle, from 1569 to 1572, when he was basely given up to Queen Elizabeth, and executed. This baronial family of Loch Leven succeeded some years after to the earldom of Morton, which it still enjoys. The island on which Loch Leven Castle is situated, lies a very little way from the shore; and between it and the point of the promontory abovementioned, a causeway of large stones runs beneath the water, which is here so shallow, that in dry seasons, when the surface is a little lower than usual, a man can wade along this extraordinary pavement. A similar curiosity exists in the lake of Forfar and in Lochmaben; but how such works were formed, or for what purpose, no one can tell. The island is two acres in extent, and is partly occupied by the garden of the castle, which is now a mere waste, though still exhibiting a few fruit trees in a wild and decayed state. The principal tower of the castle is of the ordinary size of the border towers, and can never, therefore, have contained much accommodation. Connected with it is a court-yard, 585 feet in circumference, and which has contained other buildings of a subordinate character. No date or inscription is now visible; but some years ago a projecting stone presented the letters R. D. and M. E., probably referring to Sir Robert Douglas, and his wife Lady Margaret Erskine, mother of the Earl of Murray, the jailors of the queen. It is said traditionally, that the castle was dismantled at the end of the seventeenth century. An old man living at a later period had been heard to say, that he remembered when there were fifty-two beds in it; an assertion that appears to be, upon a survey of the ruins, incredible. Loch Leven is popularly believed to be mysteriously connected with the number eleven, being eleven miles round, surrounded by eleven hills, fed by eleven streams, peopled by eleven kinds of fish, and studded by eleven islands. But some of these properties seem quite fanciful; others are untrue.

Besides the islands already alluded to, there are only two, called the Reed Bower and the Paddock Bower, both of which are so small as to be hardly worthy of notice. The trout produced in Loch Leven is of acknowledged excellence. The following memoranda respecting it are from the Statistical Account:—"The high flavour and bright red colour of the trout seem evidently to arise from the food which nature has provided for them in the Loch. A considerable part of the bottom is oozy and spongy, from which aquatic herbs spring up in abundance; and so vigorous are they in many parts, as towards the beginning of autumn to cover the surface with their flowers. The trouts, especially of size, lie much in that kind of bottom; and gentlemen accustomed to make observations in angling, know well, that even in clear running rivers, where their course takes a direction through a long tract of meadow or oozy ground, the trout that feed in that ground, if of size, are generally less or more of a pink colour in the flesh, while those that feed in a stony or gravelly soil, above or below the swampy meadows, are all white, excepting the mixtures sometimes made by floods. But what appears to contribute most to the rich taste of Loch Leven trout, is the vast quantity of a small shell-fish, red in its colour, which abounds all over the bottom of the loch, especially among the aquatic weeds. It is of a shape quite globular, precisely of the size and appearance of a linseed boll at a little distance, and the trouts, when caught, have often their stomachs full of them. These observations may account for a phenomenon of another kind. In Loch leven are all the different species of hill, or burn, or river trout, that are to be met with in Scotland, evidently appearing from the different manner in which they are spotted. Yet all these different kinds, after being two years in the loch, and arriving at three quarters or one pound weight, are red in the flesh, as all the trout of every kind in the loch are, except, perhaps, those newly brought down by floods, and such as are sickly. The silver-grey trout, with about four or five spots on the middle of each side, is apparently the original native of the loch, and in many respects the finest fish of the whole. The fry of all kinds are white in the flesh till they come to the size of a herring about the middle of their third year. The gallytrough or char abounds in the loch. Some of them weigh near two pounds, and yet they are never known to rise to a fly, or to be caught with a hook, baited in any way whatever. Besides these, there are vast quantities of pike, perch, and eel, in the loch." The fishing is let by the proprietor. The birds that breed on the loch are herons, gulls, pewit gulls, and pictarnies. When the winds are high, and blow in particular directions, the loch is very much agitated, which makes it extremely difficult to navigate, and intimidates those boating parties who make a visit to "Queen Mary's Prison" and St Serf's the object of their excursions. The lake is fed by the small river Gairney, and other streamlets on the west, and is emitted by the river Leven, which pursues an easterly course to the Firth of Forth. In recent times, the emission of the water for the river has been regulated by mechanism, and the lake partly reduced in dimensions, for the purpose of aiding the numerous mills on the banks of the stream. But though erected at an enormous expense, we understand little good and a great deal of dissatisfaction have been accomplished. The vale of the Leven is beautiful, and ornamented with the woods around Leslie, the seat of the Earl of Rothes.

SOCIETY IN LONDON.

Some recent accounts of the enjoyments of the Londoners seem to have placed them in a ridiculous point of view; but those who are well acquainted with their chosen recreations, know that there is an inherent love of the beauties of nature strongly implanted in their hearts. However true it may be that they are shopkeepers in the most degrading sense of the term—that they are desirous to obtain money—that they are inconsiderate in their credits and debits—that their imaginary wants too readily become real in the most painful sense—yet justice demands that a great portion of them should be spoken of with respect, as persons who are more alive to what is excellent in nature and in art than is generally stated. Ignorance does not hang like a weight upon them; they are capable of thinking correctly, although their language may be touched with what is denominated vulgarism.

If it be inquired where their greatest enjoyments are experienced, the reply will be, on the hills of Hampstead or Highgate, in the meadows of Dulwich, amid the beautiful of Richmond or of Hampton Court, or the grandeur of Windsor; and these are scenes worthy their selection and admiration. If their indulgence in such pleasures appear costly, they are enabled to meet the outlay. If they become conspicuous, it will arise from the hearty manner in which their excursions are undertaken, and the gaiety of heart with which they are concluded; no part of which should furnish cause for heaping on them every ridicule and opprobrium that malignity could invent.

That there are among the Londoners many who abandon themselves to expensive enjoyments, may be true as it is reprehensible: but there is no class of society free from such imputation. Among the numbers who derive princely revenues from well-conducted mercantile speculations, there are some who consider themselves entitled to assume the exteriors of splendour, and even the follies of that class whose coronets decorate the chariot panels. Hence those phenomena, the counting-house dandy and the Exchange exquisite, who, although forbidden, are orientals, ever struggling to shine in the occidental hemisphere of London. They may get fleeced by titled sharpers at superb gambling establishments; but the balance at their bankers, or their unincumbered estates, are no introductions to a rout: they are permitted to flutter in the precincts of aristocratical twilight. If, moth-like, they venture to approach the brilliant centre, a singeing of wings is the consequence of their presumption; for pride and prejudice sit, like dragons, at the portal of the *haut ton*, to scare the being connected with trade, the devotee of science, or the observing artist: they are politely waved aside, or elegantly placed in the distance.

In the middle ranks of society, at the table of a patroniser of eating and discussion—at a conversazione—at a soirée, or in the boxes of a coffee-house—there is an approach to equality and free communication of opinion, *par excellence* denominated the feast of reason and the flow of soul. But—there is ever a *but*, to furnish an exception to the rule. At either of the assemblages alluded to, there will be no difficulty in distinguishing between the professors of knowledge and the possessors of understanding. Sufficient proofs will be shown, that, to be acquainted with the title-page of a book, is not intimacy with its contents. Addison says, to understand, is to conceive with adequate ideas—to have knowledge of. Milton says, it is to know the meaning of—to be able to interpret; and Dr Johnson has placed these authorities at the word Understanding in his dictionary. Yet, in despite of all this, do certain individuals take the lead on occasions of controversy, without ability to communicate a distinct idea: they are attended to, as far as good manners require, although what they have said has passed in at one ear and out at the other: the sound and fury

have signified nothing. At times, it is a scene of high entertainment to observe one of these Solons laying down the law, ponderous and verbose, hesitating and vehement by turns—daisy-picking and delving, straining and struggling; in the midst of which he travels out of the record, reckons without his host, or, as it is facetiously called, "puts his foot in it." The knowing wink at each other, but no one corrects the error, because the asserter is very influential. He did so to provoke discussion. He is an amiable fellow. He knew better. It was merely a slip of the tongue. But the scene is more delectable to observe one of these privileged Clevertons practise on a dolt, whose gaze declares a frozen intellect, on the icy surface of which slips and slides may be made with impunity, on which the skater may roll the outside edge, and cut every figure of which he is master. A stumble might be deemed incidental, and a fall dexterous. If the surface break, the skater is in no fear of being out of his depth; he is certain his expertness will be triumphant; and he chuckles in the consciousness of superiority.

Amid the subdivisions or castes into which metropolitan society forms itself, there is one less endurable than that just mentioned, because the essence of puppyism predominates on every subject, and on every occasion. With an affectation of gravity, these persons will make assertions of frivolous tendency, and enforce their being treated seriously, and run the gauntlet of common-sense with a loquacity truly surprising. They are heedless of being rendered despicable; they are protected by their impudence. They seem never to lose their confidence. They attack the opinions of others insolently, and defend their own without the least attention to decency. If any one proceed to arrange their ideas in reply, they protest against daisy-picking. If a distinction between approximating ideas, which they have confounded, be pointed out, they declare it to be splitting of hairs. If they feel themselves overpowered by his talent, they term the speaker a demagogue. It is quite farcical to notice the unaccountable degree of arrogance some such persons will display, and the evident proofs they furnish, that they believe the "gift of the gab" to be the attainment of knowledge, and the exercise of it the super-excellence of intellectual perfection.

There is another class of persons who rank as respectable tradesmen, having it in their power to rent a house out of London, in which their families reside, and possessed of all the requisites to insure comfort; yet such is the force of habit, they cannot refrain from wasting many hours of their evenings at Burton-ale-houses, cider-cellars, and wine-shades. At places like these, men of taste, talent, and understanding, may be met, where conversation may be listened to with pleasure, and the heart improved. At places like these, the contributions of thousands, in the various departments of art, science, and literature, are well appreciated, censure or praise well directed, and justice held in the highest estimation. Who shall point out the path of enjoyment to another? This mode of spending the evening, degrading as it should seem to be, yields the interchange of thought, nay, assists in the search after truth, and cannot be dispensed with, as the parties say, with whom the practice is familiar. But—the ever interfering *but*—all is not gold that glistens. In these societies where gentlemanly behaviour prevails, some discrepancies will arise to affect the bonds of harmony: the casual entrance of a stranger; an intricate subject of debate; passing occurrences, which may produce contrariety of opinions. Men do not sit tamely, as they once did, to hear prejudice advanced for truth, or absurdity for reason. In the conflicts which occur, there is both entertainment and instruction to the listeners, by the exercise of the judgment and the risible faculties.

There is yet another class of tradesmen who have similar propensities to the foregoing persons, who are rather imitators than originators of intellectual investigation. This class may be found in the parlours of public-houses, to which they resort to talk over all the leading occurrences of the day. They are all great politicians, and frequently, in imitation of the proceedings in the House of Commons, debate the question of the preceding evening in a style that would astonish the Chancellor of the Exchequer. They are all designated learned and honourable gentlemen. They appear to feel a pride in triumphant argument; but they are neither petulant under opposition, nor furious under correction, and they exhibit the prejudices of their education without any show of vindictive feelings. They may at times talk much and have said little; tear a sentiment to tatters, or garble a point of information till it becomes unintelligible; and they can smoke in such conformity that they are almost compelled to adopt the caricatured method of discovering the gentleman on his legs by a bellows.

Detachments from these last-mentioned classes are occasionally to be found at the cigar divans, where they smoke and play chess in all the solemnity of Asiatics; or they may be engaged in a match at billiards, rarely for money, the exercise and the amusement being considered sufficient excitement. However engaged, it is pleasing to remark, that the kindly feelings are ever in operation.

There was a time when it was said that manners made the man, want of them the fellow. A change has come over the scene. Good manners are assumed by all the tradesmen of London, and rarely departed from. There are fellows in every class; integrity may justly be said to make the man; and it is the test that alone can give the true distinction. The apologist for the mode in which so many valuable members of society spend their evenings, may urge the fatigues of the day, the anxieties to which business is subjected, the desire to learn what may have transpired beyond a very confined sphere, and the friendly intercourse with kind associates. These cannot be lightly treated; the shaft of ridicule, or of reproach, would be thrown in vain. It is the usage of society: but it is attended with serious consequences to health, and detrimental to the well-being of their families at home, where many of those misspent hours might be advantageously employed.

Of the working classes, or the bees of this enormous hive, London, it is but justice to say their general conduct is such as to entitle them to the praise of every observer. They have taken advantage of the general spread of intelligence, and justify their claim to be ranked among the valuable portion of a thinking community. A successful journeyman may become a master who may make his fortune, and there can be no character more honourable in this commercial country.

TALE OF THE RHINNS OF GALLOWAY.

(Concluded.)

TIME rolled on without any change being observable in the manners or condition of the inmates of the Peel, with the exception of one circumstance—that in about a twelvemonth after the marriage of the laird, his wife was delivered of a child. As there was no medical practitioner in the district at the time, two or three matrons in the neighbourhood, who were skilled in these matters, were called in to attend the lady, which they did, not without considerable misgivings. They were well entertained, however, and, what was better, well paid; and, from their report of the internal economy of the household, and the conduct of its owners towards them, the former began to be looked upon with more favour than they had hitherto been, by their humble neighbours. The child was a boy, and the mother declared her resolution of nursing him herself; so that, after the accouchment was over, Kellholm Peel was again left in as much seclusion as before.

Several months had elapsed after this event, and the tempestuous weather which usually ushers in the winter in our northern latitude had set in, when one afternoon, during a terrific hurricane from the west, a small vessel was observed drifting up the Solway, almost at the mercy of the wind and waves. Those on board seemed to be labouring to their utmost against the storm, by tacking to and fro with great dexterity; and when evening closed down, she was seen standing close in to the English shore. The gale at this time had moderated somewhat; but as the night advanced, it again increased, and many a prayer was breathed to heaven by the inhabitants of that perilous coast for the safety of friends, lovers, and relatives, who were exposed to the fury of the raging elements, when about midnight repeated guns of distress were heard; and from the lights hung out on board the hapless vessel, it was seen that she was driving headlong on a reef of sunken rocks at a considerable distance from the shore, almost directly opposite to Kellholm Peel. A number of the fishermen who resided near the beach, roused by the well-known sounds, soon assembled opposite the spot, and endeavoured, by means of signals, to warn the crew off the destruction they were hurrying upon; but the latter, if they understood the friendly communication, were unable to avail themselves of it. The vessel struck, and went to pieces almost instantaneously. The cries of the hapless sufferers were distinctly heard above the roaring of the hurricane, and pieces of the wreck soon came drifting in to the shore, to which four or five human beings were clinging in desperation, and rescued almost lifeless. The compassionate fishermen were puzzled what to do with the sufferers, as their own habitations were two or three miles distant, and there was no human dwelling nearer the spot than Kellholm Peel, where they reckoned it altogether useless to apply for succour. Whilst yet debating upon what was to be done, they were suddenly joined by an individual, who came rushing breathless towards them from behind a projecting rock. From the darkness of the night, they could not distinguish his features; but when he spoke, and directed them to convey their charge to Kellholm Peel, they were equally pleased and astonished to recognise the voice of young Laird Douglas himself. They obeyed with alacrity; and if they felt surprised at the invitation they had received, they were ten times more so, when, on arriving at the mansion, they found it in a state seemingly of preparation for visitors. A large fire was blazing up the immense chimney of the hall; refreshments were ready placed upon the huge oaken table; several couches of hay, covered with blankets, were spread down in various recesses of the apartment; whilst the lady of the mansion and her handmaid were waiting as if in full expectation of their arrival. The young laird himself, too, seemed to have thrown aside all his usual moroseness and misanthropy. He aided in administering restoratives to the shipwrecked crew, pressed the wearied fishermen to partake of the viands set before them, and finally insisted on their resting themselves on the sleeping places provided (as he said) for them until morning. They did so with thankfulness, although almost bewildered with wonderment at all they saw and heard. But if they lay down in astonishment, they were doomed to a more fearful awakening. Two or three hours might have elapsed after their lying down to rest, when they were roused by screams and cries of the most frightful description, resounding through the mansion, and, starting up, beheld to their dismay dense volumes of smoke rolling into the hall from the inner apartments, and other unequivocal symptoms of the place being in flames. The shipwrecked mariners made to the outer door as fast as possible; but the native fishermen, naturally as humane as courageous, and thinking as much of the safety of the unfortunate inmates as their own, were about to dash through the choking smoke into the interior of the building, in order to attempt their rescue, when a figure rushed out half-dressed, daggled with blood, and with all the marks of frenzy in his features. It was the young laird.

"Flee! flee!" he shouted wildly; "it is a doomed house—it is a doomed house!" and, without stopping an instant, darted out of the open door, and was lost in the midnight darkness that still prevailed. The wrecked sailors, who had drawn together a little way opposite the blazing building, started aside aghast, as this apparition broke through them, and darted down towards the shore, shouting and yelling with the fearful laughter of madness! The undaunted fishermen, however, did not even then think of retreating. As the cries and screams still continued from within, two of them groped their way, blind and breathless, towards the quarter whence they proceeded, and one of them at last reached the apartment where the lady of the house, from whom the cries proceeded, was lying on her bed, seemingly in a state of delirium, whilst almost every article of furniture in the room, with the bed itself, was blazing around her. He snatched her up in his arms, and with difficulty reached the door. His comrade had in the meanwhile been fortunate enough to rescue the serving-girl; and the two females were immediately conveyed to a small outhouse that stood near the tower, and supplied with what clothing could be saved from the outer hall; for, from the violence of the hurricane, the flames seized on every part of the building with the rapidity of gunpowder. Meanwhile, the lady became every moment worse and worse—now sinking into convulsive fits, and, upon recovering from them, screaming out incessantly, "My husband! my brother! my child! my husband!" and, before day dawned, expired with these wild and unintelligible exclamations on her lips.

Early in the morning, the whole district was astir with the news of the double calamity of the shipwreck and conflagration of the preceding evening, and all sorts of rumours were afloat respecting the mysterious occurrences which attended the latter event. The civil authorities were quickly on the spot, and a strict investigation was set on foot into all the circumstances. The shipwrecked mariners stated that they were part of the crew of a small Irish coasting vessel, and that they belonged to Dundalk; that two strangers, whom they knew nothing about, had, a day or two previous to their sailing, waited upon their captain (who had perished on the previous night), and hired their sloop to convey them to a small sea-port on the English coast. That the hurricane had overtaken them when about midway to their destination, and after endeavouring in vain to run into some haven on the southern shore, they had been directed by one of the passengers, who seemed quite intimate with the coast, to make for a light which was descried exactly above the place where their bark had struck, but which was observed to be suddenly extinguished ere the catastrophe happened. Two of the sailors asserted, that, while the ship was going to pieces, they observed the two strange passengers clinging to a plank, and drifting fast towards the shore. More of them they could not tell, excepting that they both appeared of an advanced age, and were seemingly of a respectable rank in life. A long and anxious search was made along the beach for several miles; but although the bodies of the unfortunate captain, and one or two others of the crew, were found, no trace of the two passengers could be discovered. Not a doubt was entertained, however, that both had perished. Respecting the fearful casualty at the Peel, no explanation whatever could be got. The young infant, it was conjectured, had perished in the flames. But as to Laird Douglas—his frantic and apparitional appearance and disappearance—his gory figure—the unintelligible expressions

of his dying lady—all were inexplicable, as, indeed, every previous occurrence connected with the Peel had been since the accession of the Irish family. The female servant, who was supposed to be the daughter of the "Witch of the Rock," was either unable or unwilling to afford the slightest cue to the mystery, and could hardly, moreover, give any proper account of herself. She had lived, she said, in the family of a poor peasant, in the south of Ireland, from her infancy until womanhood: that she had always been given to understand that she was the daughter of the old woman above mentioned, who, about two years since, had taken her away clandestinely from her early home, and brought her to Scotland: that her supposed mother was in the habit of visiting Ireland two or three times a-year, but for what purpose she knew not: that shortly after her final disappearance, and, as she supposed, her death, Laird Douglas had revealed to her that she was *not* the daughter of the old female, but was of a much better origin; but that certain circumstances rendered it dangerous for her to be acknowledged for a short time. Of the nature of the connection which existed between the laird and her previously-supposed parent, she could give no explanation, and was equally ignorant as to the relation in which she herself stood to either. Neither had she ever discovered who the laird's wife was, and could only say that they seemed to live happily together, notwithstanding their secluded habits of life.

This story of the young woman, however, only rendered matters more inexplicable than before, and every attempt to clear up the mystery was found in vain. No intelligence could be got of the young laird; the property was taken charge of by the proper authorities, until those who had the next legal right to it should appear; and the friendless female thankfully accepted service with the farmer in whose house her late master had passed his boyhood.

Upwards of half a century rolled on, continued my friend, without any thing transpiring to afford the smallest explanation of the above strange and tragical occurrences, when, about six or seven years ago, a vessel sailed from this part of the country with a number of emigrants to the back woods of America. As the captain of the ship had it in contemplation shortly to follow their example himself, he accompanied them, after the termination of their voyage, far up into the wilderness, for the purpose of examining the country. With this view he had strayed many miles from the encampment one day, alone, when he was encountered in the forest by an old man, attired and armed like one of the savage aborigines, but whose complexion and cast of features declared him to be an European. After a mutual pause of surprise, the demi-barbarian addressed the other in English, and questioned him who he was, whence he came, &c. &c. The seaman replied frankly to his interrogatories, and observed that the other was deeply agitated by his answers to them. The old man at last acknowledged he was a countryman, and a native of the same district of Scotland, and questioned him, with evidently intense interest, concerning Kellholm Peel, its present condition, and the strange circumstances connected with its history and last owner. As the matters before related had all taken place long before the seaman was born, he could only state what he himself had heard of them by tradition, being exactly as has been detailed. When the old man heard that the daughter of the woman who was called the Witch of the Rock was still living, though too infirm to be able to support herself, he suddenly caught the narrator by the arm. "Stranger!" said he, "she who was supposed to be that woman's mother lies in yonder valley (pointing to an opening between the mountains), and long, long have I wished to be laid beside her; but what you have now told me gives me hope, that, in preserving my life through so many years of hardship, peril, and anguish, the Almighty has indeed been dealing mercifully by me, and that a door has at last been opened for reconciling myself to the throne of grace. Countryman! you behold in me a terrible example of the punishment that awaits him who presumes to become the avenger of his own wrongs—to shed blood for blood with his own hand—to arrogate to himself the privileges of the Almighty. But come to my abode, and I will there unfold my fearful story." He led the way into the deep recesses of the forest, seemingly far from any human track, and entered a cavern scooped out of the side of a precipitous bank that overlooked a small stream. The entrance was secured by a strong door of wicker-work, and was completely hid from observation by a thick natural screen of some creeping shrub, which hung down like a curtain from the top of the bank, and had to be lifted up to give admission into the cavern. After partaking together of refreshments of various kinds, of which there seemed to be abundance, the old man then related his story to his guest, which affords a thorough explanation of all the mysterious transactions connected with Kellholm Peel and its last proprietor—the old man thus strangely discovered in the wilderness of the new world—for he it indeed was. To save time, his narrative will be best told in the third person.

The old woman called the "Witch of the Rock" was the foster-mother of O'Rourke, the first Irish proprietor of Kellholm, and of course warmly attached to him, but could not be prevailed on to attend him to Scotland on his removing thither. When the inheritance of the Irish estate opened up to him, she was the only one who dared openly to assert his rights; and when the dark fate of the unfortunate man was made known, she scrupled not to denounce Sir Phelim O'Rourke, the next heir in succession after her foster-son's children—a "bold bad man," with a large family, and in desperate circumstances—with being the murderer. For this she was obliged to conceal herself, in order to save her life from his fury; but she still lingered about the district, and at length got intelligence, from one of the actors in the tragedy, of the burning of Kellholm Peel, and the entire destruction of her foster-son's family. Upon this she determined instantly to bring a public accusation against the chief perpetrator, but was deterred from executing her purpose upon being subsequently told that one of the children had been preserved, brought to Ireland, and placed by Sir Phelim in the charge of a poor woman, the wife of one of his cottagers. To get possession of the orphan child (a girl) became now her first thought; and this, after great trouble and difficulty, she at last accomplished, and succeeded in escaping with her across the Channel. It was at this time she first made her appearance in Galloway, and took up her lonely residence on the rock. The reason of her not immediately disclosing the existence of the child to the neighbours and connections of the family, arose from her terror of the vengeance of Sir Phelim, in the event of the circumstance reaching his ears, as she knew he would in that case stop at nothing to accomplish the destruction both of herself and the infant. Her fears and dilatoriness, however, proved fatal to her. Sir Phelim got intelligence of her abode, and, as has been seen, again carried off the infant from the hut on the rock; and it was only by her knowledge of the hiding-places about the beach, that she herself escaped being murdered. It was shortly after this event that she discovered, to her unbounded joy and surprise, that another child of her foster-son's existed; and this accounts for the remarkable change that was at the time observable in her deportment. She threw herself in the boy's way during his rambles, told him the story of his parents' wrongs, and trained up his young mind to the contemplation of but one object—vengeance on the perpetrators. When the young laird came to take possession of the Peel, the two confederates forthwith proceeded to put their plan into execution, being no less than that of utterly annihilating the family of Sir Phelim O'Rourke, root and branch. It was in the execution of this fearful work of vengeance they were employed during their mysterious absences from the Peel, and it was during one of these that the old woman thought she had discovered in the family of a poor peasant the sister of the laird of Kellholm, for whom, when an infant, she had suffered so much, and whom she had little difficulty in persuading to accompany her to Scotland. It was judged prudent, however, both by the laird and his confidante, that she should not be recognised as his sister until they had fully accomplished their dangerous and bloody purpose. With so much secrecy and deep cunning was the latter carried into effect, that the victims seemed all to have perished as if by accident or a natural death. One was found drowned in a neighbouring river; another was discovered lying at the foot of a precipice, as if he had accidentally fallen over it; a third, a favourite daughter, was found cold and stiff in bed one morning without any marks of violence discernible on her person; other two, a boy and girl, went out one day to gather nuts in a wood near their house, and were never more heard of, but it was universally believed that they had fallen into the river, and had shared the fate of the former son. The only one upon whom foul play was known to have been used, was the last of the children, the eldest son; and the circumstances attending it will sufficiently evince the fearfully cool and calculating determination with which the young laird of Kellholm proceeded to fulfil his designs. In the family of Sir Phelim resided a beautiful girl, the daughter of an elder brother, and who had been left an orphan in the care of her uncle, while yet an infant. As she was entitled to a very large patrimony, Sir Phelim had resolved on a union between her and his eldest son; and although the girl herself candidly stated her repugnance to the match, there is little doubt she would have been compelled to comply with his wish. The young laird learned her story and situation from his associate, and, during one of his secret and bloody missions, he contrived to introduce himself to her, revealed his name, and succeeded in inducing her to accept his hand, and fly to Scotland with him. Upon the very night of their elopement, her former lover was amissing, and, two days afterwards, was found lying in a deep pool, with a dagger driven up to the hilt, sticking in his breast. What added to the horror of the old father, now utterly bereaved and desolate, was the discovery that the dagger, or rather the short sword, for such it was, with which his son was slain, was the identical one which he had lost while engaged in the destruction of Kellholm Peel, about a quarter of a century before; and upon examining the handle, there was found attached to it a small slip of parchment, on which were written the following significant words:—"Bluid for bluid! Vengeance is slow but sure!"

The avenger of his parents, however, thought his work but half accomplished, whilst the principal, or rather the only criminal, existed; but it was found no easy task to get an opportunity of accomplishing their purpose on him, owing to the precautions he adopted for his security. At last the old woman hit on an expedient for enticing him away from his well-guarded home, which at once proved successful. She contrived to send him notice, that, by repairing to a small fishing hamlet in Dundalk bay, on a certain day, he would there meet with an individual who would give him some information about his two children who had been lost so mysteriously. Sir Phelim eagerly attended at the appointed time, and was met by the old woman, disguised in sailor's attire, who with a feigned and plausible story about his children having been kidnapped, and of their being then concealed at a small sea-port on the English coast, preparatory to being sent off to the colonies, induced him immediately to hire a vessel, and proceed with all dispatch to their rescue. The disguised sailor, in the meantime, had come to a proper understanding with the master of the vessel, that, although he and his companion were ostensibly proceeding to the English coast, yet it was their wish to be set on shore under cloud of night on the coast of Galloway; and this hint was enforced by a sum sufficient almost to have induced the poor skipper to scuttle his old boat in the middle of the Channel, could they have but got safe ashore. The hurricane that sprung up, however, rendered that unavoidable which must have otherwise been effected by stratagem. The young laird was on the outlook, and, from certain signals previously agreed on with his confederate, well knew the vessel that came driving up before the hurricane, and the freight which she contained. When it became dark, he proceeded to the Witch's Rock with a lantern, placing it so that it could only be visible from the sea, and towards which his confederate on board directed the master of the vessel to steer. By so doing, they would have run into a small but safe bay to windward of the rock; but the violence of the hurricane disabled them from weathering the fatal reef which lay at the entrance to it, and produced the consequent catastrophe. The disguised decoy, however, even amid the tumult of the wreck, never for a moment lost sight of her victim, and upon his seizing hold of a plank, and committing himself to the waves, she also sprung after him, and they were drifted ashore together at a considerable distance to leeward of the others. Here, as if by instinct, the young laird was waiting, and a signal of recognition from the latter was instantly answered. Their victim was so much exhausted, that he was almost incapable either of walking or speaking, and was led by his guides into one of the caverns (of which there are so many) along that part of the Galloway coast, and from thence by a passage, excavated from the solid rock, into a vault beneath the very foundations of the Peel. Here they left him for a while, the old woman proceeding by a secret passage into a secluded apartment of the upper building, and Douglas to attend to his guests.

All the other wearied inmates of the Peel had sunk to rest, when Douglas, with his partner in vengeance, the latter attired as during her residence on the rock, and carrying a large pine torch, descended to the vault beneath the tower, to consummate the work which they had pursued for years with such remorseless determination. Notwithstanding his clothes were dripping with the salt water, and his bed nothing but the hard rock, the object of their deadly purpose was slumbering soundly. Douglas proceeded to bind securely his hands and feet (for although the latter was far advanced in life, he was still a man of a powerful and almost gigantic frame), and then awoke him by shaking him violently with his foot. O'Rourke started up, and the feelings of the miserable man may be imagined, when told where he was, the purpose of his being brought there, and who stood before him. But awful as his sensations must have been at the announcement of his impending doom, he was made to drink a still deeper draught of misery, as his triumphant foe proceeded to detail the whole story of his vengeance, dwelling on all the circumstances accompanying the death of his successive victims with torturing minuteness. Rage, fear, remorse, every evil and turbulent passion, was boiling in his bosom, and he groaned aloud in the agony of his spirit, as the other calmly drew forth his weapon, and bade him prepare for death. The awe-stricken wretch begged for one moment's respite, and upon this being granted, asked his destroyer if he knew what had become of his lost niece, who had left her home so unaccountably about eighteen months before, adding, that there was a secret connected with her for the knowledge of which even Douglas would be glad to forego his present revengeful purpose. Douglas smiled sternly as he informed his victim that the young lady was the mistress of his mansion and the mother of his infant; but scarcely had the words escaped him, when a shout of exultation burst from the prostrate man, who, turning a withering look on Douglas, exclaimed that he would now die contented, as the deaths of his children were more than avenged—their murderer had wedded his own sister! The old woman, after a pause of stupifaction, here started forward, and asserted his statement to be false; but the other, with resolute firmness, told her, that, by his direction, the infants, who were of the same age, had been changed in the cradle by the nurse, lest the sister of Douglas should again be attempted to be stolen, and that it was his niece who had been reared in the peasant's hut. Douglas, who had stood speechless at first, on hearing this information, at length uttered a cry of frenzy, and, springing upon his unhappy victim, soon put a pe-

riod to his existence. Of his further conduct that night, the old man told his shuddering auditor, his mind retained no impression. He only remembered being instigated by an ungovernable desire to obliterate all recollection from his senses. In short, he became for a while perfectly insane. On coming to his senses, he found himself lying on the beach, in the grey of the morning, severely bruised, with the old woman bending over him. They retreated into the cavern, and abode there until the following night, when they set out to a distant sea-port on the west coast of England, and being provided with money, soon obtained a passage to North America.

Such was the dismal story of the old man, which he corroborated by taking down a small box from a recess in his cavern, from which he took out the title-deeds to the property of Kellholm estate. These, he said, had been kept for security in the vault beneath the Peel. He concluded by saying, that he wished to make the unfortunate niece of his uncle his heir in the property, it being in his own gift, and begged his guest to convey home the proper documents for that purpose. This the other most readily promised to do. Upon the return of the latter to his ship, therefore, the old man accompanied him down the country to the sea-port town, where, after getting the necessary writings drawn up and executed, he bade farewell to his countrymen, and returned to his abode in the wilderness, and was never heard of more. When Captain Fisher arrived in Scotland, he immediately transmitted his packet to the sheriff of the district, with a full detail of the above singular narrative. Immediate steps were taken to carry the old man's disposition into effect, and amongst other things a search was made in the ruins of Kellholm Peel for the entrance to the vault beneath, of the existence of which no one had ever previously heard. It was found after considerable trouble, and in it was found the skeleton of a large man, with a dagger covered with rust lying close beside it. This was an undeniable testimony of the truth of the old man's tale; but as it was judged proper by the legal functionaries to get some further proofs of the poor woman's identity, thus unexpectedly raised from the extremity of poverty to wealth, instructions were transmitted to Ireland, to investigate into the matter. Only one witness could be found who knew any thing at all of the singular circumstances of the case. This was the daughter of the nurse in Sir Phelim's family, who, according to the latter's dying declaration, had, by transposing the infants, occasioned the supposed horrible casualty before mentioned. The result of this woman's evidence was a disclosure of a most unexpected nature. She stated that her mother on her death-bed had informed her of the deed which Sir Phelim had wished her to perpetrate, but that she could not make up her mind to do it, and had imposed upon him with a false story. The dying woman had charged her daughter, by the most solemn adjurations, never to mention the circumstance to any living being, unless called upon in the way she now was; and added, that, if any doubt was entertained of the statement, the identity of the real or the false niece would be proved by particular marks she had made on different parts of their persons at the period alluded to. Upon examination, the mark which the old woman said she had made on the Scotch infant was plainly discernible on the person of the poor old woman now living; and there is not room for a doubt that she is the sister of the unfortunate Laird of Kellholm Peel, and, as such, entitled to the property and all the accumulated money, which is very considerable. She still dwells with the kind family where she formerly took service, and who have almost exclusively supported her for many years, from pure benevolence, as, being now near her eightieth year, she has been long unfit for labour of any sort. Such, concluded my friend, is the strange history of Kellholm Peel and its late and present proprietors; and as I understand you are somewhat of a philosopher, continued he, smiling, I think you cannot do less, in return for my story, than furnish me with a moral to it.

"The unhappy hero of it," I replied, "has, I think, saved me from such a dilemma—Revenge is not the province of man. But," continued I, "there is one point of your story which I do not very clearly understand. What could be the Irish baronet's motive for wishing to do such injustice to his innocent niece, as to substitute the daughter of the man whom he had murdered in her place, and even to purpose marrying his son to the latter?"

"Why," replied he, "that appears altogether inexplicable, unless upon the supposition, that, by conjoining the patrimony of the real niece with that of the spurious one, he saw the ultimate prospect of increasing the wealth and influence of his family, which appears to have been the prime motive of his whole conduct; whilst, by holding such a secret over the head of the latter, he thought he might more easily sway her to his purposes than the other."

I nodded assent to the probability of his conjecture, and the conversation ended.

It may perhaps not be uninteresting to state, that the old lady who was elevated so unexpectedly from penury to wealth, enjoyed her good fortune for about ten years afterwards, still continuing to reside with the homely, benevolent family who sheltered her in her days of adversity. At her death, she bequeathed the whole of her property to them; and as Kellholm Peel had latterly become, by the ravages of time, almost levelled with the earth, a handsome modern mansion has been erected on its site, the hospitality and urbanity of whose present owner is likely to be much longer remembered in the district than even the misanthropic disposition and unfortunate fate of his predecessor.

BIOGRAPHIC SKETCHES.

CHAUCER.

The invention of printing contributed to the revival of learning in the fifteenth century; from which memorable time a race of learned men arose, equal in point of ability with the greatest geniuses of antiquity. Of these we may say, without vanity, that our own countrymen are justly entitled to the reputation of the first rank. To the claims of some of the most eminent of these, we shall now more particularly direct the attention of our readers, by presenting them with a few articles on the lives and writings of those who are worthy of being denominated the *classical* authors of Britain; and we commence with Chaucer, who acquired the general designation of the Father of English Poetry, and who appeared somewhat prior, even, to the era alluded to.

Geoffrey Chaucer was born at London in the year 1328; but although he was extolled in the highest terms of panegyric by his contemporaries, and has also deservedly maintained his reputation with posterity, it happens that no certain information has been handed down in regard to his parentage; only, it is presumed that he was by birth a gentleman. The same uncertainty that attends the history of his parentage attends that of his education. Whether he studied at Oxford or Cambridge, or at both universities successively, is a point which cannot now be at all decided; but that his education was excellent for that age, is clearly proved from the learning displayed in his works; and that his genius rose still superior to all the advantages of scholastic or academic institution, will admit of no dispute.

After completing his scholastic education, he is supposed to have improved himself by travelling into France and the Low Countries; and it is partly ascertained, that, on his return, he entered himself a member of the Inner Temple, and for some time prosecuted the study of the law. In a record of this society, published by Speight, the following fact appears: "Geoffrey Chaucer was fined two shillings for beating a friar in Fleet Street."

It does not appear, however, that he ever practised the law as a profession; and the sprightliness of his genius, the elegance of his form and manners, and the fertility of his endowments, seem early to have attracted the notice of the court, where he particularly devoted himself to the service of the celebrated John of Gaunt, Duke of Lancaster, son of Edward the Third. By the favour of this prince, he obtained in marriage Philippa, daughter of Sir Pagan Rouet, and sister of the famous Lady Catherine Swynford, who was first governess to the duke's children, and afterwards became his wife.

Chaucer was at this time in the flower of his age, admired for the elegance of his person, and distinguished for every other talent and accomplishment that could render him acceptable in the gay and splendid court of Edward the Third. As that monarch frequently resided at Woodstock, Chaucer had a house near the park gate, which still retains his name, though it has been entirely rebuilt and modernised; and here it is probable that he penned some of his happiest compositions.

After serving for some time as the king's page, he was appointed a commissioner to go to Venice to treat with the republic of Genoa for the hire of some ships; and on his return from this embassage he obtained, among other marks of royal favour, the grant of a pitcher of wine daily. Next year he was made comptroller of the customs of London, for wool and hides; with the singular proviso, that he should execute the office personally, and not by deputy, and keep the accounts in his own handwriting—a pretty clear proof that Edward did not promote him for his poetical talents, otherwise he would certainly have given him a somewhat different employment. Soon after this, he was appointed to act as guardian to one of the king's wards, an office of both honour and profit; at which time it appears that his income was not less than a thousand pounds a-year, a sum which in those days enabled him to support a splendid hospitality congenial to his disposition, and to enjoy that ease and affluence which it is so rarely the lot of a poet to possess.

It was during this sunshine of prosperity that he wrote his chief poem, entitled "Canterbury Tales," which is by far the most popular of his works, and exhibits a striking variety of talents, or union of the sublime and the pathetic, with such a fund of poignant satire, genuine humour, and knowledge of life, as is seldom paralleled. The clergy, both regular and secular, are the frequent object of his keenest animadversions; and by this he most probably aimed to ingratiate himself the more with his patron the Duke of Lancaster, who had openly espoused the cause of Wickliffe the reformer.* Chaucer entered passionately into Wickliffe's views of reformation, but this in the sequel involved him in much trouble; for when the Duke of Lancaster found himself obliged to abandon the party of Wickliffe, and to retire from public life for a time, the interest of Chaucer sunk at once, and he became from that instant exposed to all the malice of his patron's opponents. At this time he retired to Woodstock, where he finished his admirable treatise on the Astrolabe, as also the beautiful performance called the Testament of Love, written in imitation of Boetius's Consolation of Philosophy.

By the return of the Duke of Lancaster to favour and power, and the marriage of that great man with the sister of Chaucer's wife, the sun of prosperity again beamed on his evening hour; and, when about seventy years of age, he quitted Woodstock, for Donnington Castle, near Newbury.

Not long afterwards, Henry the Fourth, son of the Duke of Lancaster, mounted the throne; and in the first year of his reign he conferred some marks of his regard on Chaucer. His former grants, however, being annulled, in common with all others passed in the late reign, the venerable bard, in the concluding scene of his life, was obliged to become a solicitor at court for a renewal of his pensions; and though he succeeded in a certain degree, the fatigue of attendance, and his great age, prevented him from enjoying long the royal favours. Falling sick at London, he died, October 25, 1400, in the seventy-second year of his age, with a kind of enviable philosophical composure, as appears from the song beginning "Flie fro the Prese," which he wrote on his deathbed.

He was buried in Westminster Abbey, where, in 1556, a monument was erected to his memory by Nicolas Brigham of Oxford, from a just regard for his talents. He left two sons, Thomas and Lewis; the former of whom was speaker of the House of Commons in the reign of Henry the Fourth, and passed through several other high offices with reputation and applause.

The private character of Chaucer appears to have been as amiable as his literary attainments were illustrious. Genteel and complaisant in his manners and address, frank and liberal in his disposition, he was at once the fine gentleman, the easy companion, and the learned writer.

On his poetical and other literary qualifications, it is unnecessary to expatiate here. He was the Father of English Poetry, being the first who wrote original verses in his native tongue. Before his time all poetical compositions here were confined to the French and Latin, or translations from those languages. He was also the first writer in England to whom the appellation of a poet, in its genuine dignity, can be with propriety applied. He attempted every species of versification, from the epigram to the epic, and was eminently successful in all.

As some of our readers may wish to see a specimen of the poetical composition of those times, we select the following lines of Chaucer, from what he calls "The Pardoner's Prologue," in the "Canterbury Tales."

Lordings! quoth he, in chirch when I preche,
I paine mee to have an hauteine speche;
And ring it out, as round as doth a bell;
For I can all by rote that I tell.
* * * *
Then shew I forth my long, christall stones,
Ycrammed full of clouts and of bones;
Relickes they been, as were they, echone!
Then have I, in Latin a shoder-bone,
Which that was of an holy Jewes-shepe.
Good men, say, take of my words kepe!
If this bone be washen in any well,
If cow, or calfe, shepe, or oxe swell
That any worm hath eaten, or hem strong,
Take water of this well, and wash his tong,
And it is hole a non: And, furthermore,
Of pockes, and scabs, and every sore
Shall shepe be hole, that of this well
Drinketh a draught: Take keep of that I tell!
If that the good man, that beasts oweth,
Wull every day, ere the cock croweth,
Fasting drink of this well a draught,
(As thilk holy Jew our elders taught)
His beasts and his store shall multiplie;
And sirs, also it healeth jealousie.
Here is a mittaine eke, that ye may see;
He that has his hand well put in this mittaine;
He shall have multiplying of his graine,
When he hath sowen, be it wheat or otes,
So that he offer good pens or grotes!

Those who would prefer the thoughts of this Father of English Poetry in a modern dress, are referred to the elegant versions of him by Dryden, Pope, and others, who have done ample justice to their illustrious predecessor.

* Vide Mavor's British Nepos, p. 40.

OLYMPUS AND PARNASSUS.

The celebrated mountain Olympus was considered not merely as the loftiest summit in Greece, but even, in the opinion of the ancient geometricians, as the highest elevation of the globe. Its height, we are informed, was accurately measured by the philosopher Xenagoras, and found to be ten stadia and a plethrum, or nearly 7000 English feet. This is somewhat more than the elevation assigned to it in the Memoires de l'Academie des Sciences, by John Bernoulea, where it is given at 1017 toises, or 6512 English feet. The misfortune is, that in these measurements no mention is made of a fixed base, to enable us to judge of the accuracy of the calculations. Snow is said to lie frequently on certain parts of Olympus during the whole year. The ascent, however, is perfectly practicable in the summer season; as Sonnini himself visited its summit from Salonica during that season; and a small Greek chapel has even been constructed near the top, where service is performed once a-year, with singular contrast to the old mythology of the spot. The monastery of St Dionysius, on the eastern side, is the highest habitation on the mountain. Its elevation has been prodigiously exaggerated by the poets, who described it as the throne of Jupiter, and the habitation of the gods. Hence Jupiter was denominated the Rector Olympi, or Ruler of Olympus, in the pagan theology. With them it exceeded every other mountain in Greece, both for height, massiness, and grandeur. The giants were fabled to have made Olympus the highest step of that ladder by which they endeavoured to scale the abode of the immortals.

Olympus is now called Elimbo in Romaic, and Samavat Eski, or the Celestial House, in Turkish. The appellation Olympus, perhaps, formerly denoted any very lofty eminence, as it was common to many celebrated mountains. "Towards the south-east," says Dr Clarke, "and rather behind our route as we journeyed towards Tempe, appeared Mount Pelion. But the view of Olympus engrossed our particular attention, owing to the prodigious grandeur into which its vast masses were disposed. We had never beheld a scene of bolder outline. In this grand prospect, the only diminutive objects were the distant herds of cattle, grazing in detached groups on the plain in the foreground. All the rest consisted of parts of such magnitude, that, in their contemplation, animated nature is forgotten. We think only of that Being who is represented in the immensity of his works, and thereby indulge the same feelings which first induced the benighted heathens to consider the tops of their mountains as habitations of the Most High God."

Lofty as Olympus was represented by the poets, yet an altar was erected on its summit, where Jupiter was worshipped. The best view of this far-famed mountain is from the plain of Pella to the north, or from the city of Salonichi, where its magnitude is such as to fill all the view towards the western side of the Gulf of Thermæ, and actually to dazzle the eyes of the beholder with the radiance reflected from its snow-clad summit. Instead of seeming remote from the place of his observation, though fifty-five miles distant, so enormous is its size, as to seem close to his view. This view, however, was taken in the midst of winter, by Dr Clarke, during his stay at that place. It will not therefore present so sublime a spectacle in the summer months, when its snows are melted. The base and sides of Olympus are covered with thick woods of oak, chestnut, beech, and planetree; and the acclivities are clothed with large pine forests, giving that sombre appearance to it so often alluded to by the poets, being denominated by Horace, Lib. iii. Od. 4, Opacus Olympus; and by Seneca, Pinifer Olympus. Its summit is an obtuse cone, with somewhat of a concave line on each side.

The famed Parnassus seems to be regarded by Clarke and Holland as the loftiest summit in Greece. The former ascended it in the month of December, and reached the summit after consuming 4½ hours in the journey from the village of Arracovia. The summit was a plain in the bottom of a crater, containing a large pool of water, then frozen over. The sides of this crater, rising in ridges around this plain, are the most elevated points of Parnassus. The summit, therefore, strongly resembles that of Kader Idris in Wales. These sides were then a glacier, covered with hard and slippery ice. The atmosphere was clear and cloudless, and the thermometer in the open air fell to two degrees below the freezing point. The prospect was varied, sublime, and extensive; the Gulf of Corinth seemed a mere pond; and towards the north, beyond all the plains of Thessaly, appeared majestic Olympus, with its many tops, clad in shining snow, and expanding its vast breadth distinctly to the view. The other mountains of Greece rose in vast heaps, like the surface of the ocean in a rolling calm, according to their different altitudes, but the eye ranged over them all. As a proof that the ascent to the summit is comparatively easy, the peasants conducted the horses of Clarke and his party quite to the frozen pool on the summit. The top and all the higher sides of the mountain are limestone, containing veins of marble, and a great number of imbedded sea shells. These are found on the highest peak, and over all the mountain. The higher region is bleak, and almost destitute of herbage. The descent on the north-west side occupied 4½ hours. The people of the plains of Bœotia call the whole mountain Lakŭrä; but those who reside on it still retain the ancient name, calling the heights by a general appellation Parnassu, and one of the ridges in particular Lugari. In strictness of speech, Parnassus is not one mountain, but a range of mountains running from north-west to south-east, where it rises into one great summit. The poetic appellation of the Biceps Parnassus, or the Double Peaked, is erroneous, though sanctioned by almost all the classic poets. This appellation properly belongs to two pointed crags, formed by a chasm in a precipice 100 feet high, in the bottom of which is the fount of Castalis, towering above and behind Delphi. These being a part of the mountain, have been erroneously considered as the tops of it. They are estimated vaguely by Dr Holland at 800 feet of elevation above the level of Delphi, and 2000 above the sea.*

THE ITALIAN SLEEP-WALKER.

In the recently-published cheap and elegant edition of Goldsmith's works, forming part of the series of publications entitled "The British Library," we are presented with many pieces not hitherto generally known as the productions of the ingenious author of the Vicar of Wakefield. Among others, is the following little sketch, descriptive of a remarkable instance of walking in sleep:—

It has often been a question in the schools, whether it be preferable to be a king by day, and a beggar in our dreams by night; or, inverting the question, a beggar by day, and a monarch while sleeping? It has been usually decided, that the sleeping monarch was the happiest man, since he is supposed to enjoy all his happiness without contamination; while the monarch in reality feels the various inconveniences that attend his station.

However this may be, there are none sure more miserable than those who enjoy neither situation with any degree of comfort, but feel all the inconveniences of want and poverty by day, while they find a repetition of their misery in a dream. Of this kind was the famous Cyrillo Padovano, of whom a long life has been written; a man, if I may so express it, of a double character, who acted a very different part by night from what he professed in the day. Cyrillo was a native of Padua, in Italy, a little brown-complexioned man, and, while awake, remarkable for his simplicity, probity, piety, and candour; but, unfortunately for him, his dreams were of the strongest kind, and seemed to overturn the whole system of waking morality; for he every night walked in his sleep, and, upon such occasions, was a thief, a robber, and a plunderer of the dead.

The first remarkable exploit we are told of Cyrillo, was at the university, where he showed no great marks of learning, though some of assiduity. Upon a certain occasion, his master set him a very long and very difficult exercise, which Cyrillo found it impossible, as he supposed, to execute. Depressed with this opinion, and in certain expectation of being chastised the next day, he went to bed quite dejected and uneasy; but awaking in the morning, to his great surprise he found his exercise, completely and perfectly finished, lying upon his table, and, still more extraordinary, written in his own hand. This information he communicated to his master when he gave up his task, who, being equally astonished with him, resolved to try him the next day with a longer and a more difficult task, and to watch him at night when he retired to rest. Accordingly, Cyrillo was seen going to bed with great uneasiness, and soon was heard to sleep profoundly: but this did not continue long: for, in about an hour after he lay down, he got up, lighted his candle, and sat down to study, where he completed his work as before.

A mind like Cyrillo's, not naturally very strong, and never at rest, began, when he arrived at manhood, to become gloomy, solicitous, and desponding. In consequence of this turn of thinking, he resolved to leave the world and turn Carthusian, which is the most rigorous of all the religious orders. Formed for a severe and abstemious life, he was here seen to set lessons of piety to the whole convent, and to show that he deserved the approbation as well of his fellows in seclusion as of the whole order. But this good fame did not last long; for it was soon found that Cyrillo walked by night, and, as we are told of the fabled Penelope, undid in his sleep all the good actions for which he had been celebrated by day. The first pranks he played were of a light nature, very little more than running about from chamber to chamber, and talking a little more loosely than became one of his professed piety. As it is against the rules of the fraternity to confine any man by force to his cell, he was permitted in this manner to walk about; and though there was nothing very edifying in his sleeping conversation, yet the convent were content to overlook and pity his infirmities.

Being carefully observed upon one of these occasions, the following circumstances offered:—One evening, having fallen asleep on his chair in his cell, he continued immoveable for about an hour; but then, turning about in the attitude of a listener, he laughed heartily at what he thought he heard spoken; then snapping his fingers, to show he did not value the speaker, he turned towards the next person, and made a sign with his fingers, as if he wanted snuff. Not being supplied, he seemed a little disconcerted; and, pulling out his own box, in which there was nothing, he scraped the inside as if to find some. He next very carefully put up his box again; and, looking round him with great suspicion, buttoned up the place of his frock where he kept it. In this manner he continued for some time immoveable; but, without any seeming cause, flew into a most outrageous passion, in which he spared neither oaths nor execrations, which so astonished and scandalized his brother friars, that they left him to execrate alone.

But it had been well if poor Cyrillo went no farther, nor driven his sleeping extravagances into guilt. One night he was perceived going very busily up to the altar, and, in a little beaufet beneath, to rummage with some degree of assiduity. It is supposed that he wished to steal the plate which was usually deposited there, but which had accidentally been sent off the day before to be cleaned. Disappointed in this, he seemed to be extremely enraged; but not caring to return to his cell empty-handed, he claps on one of the official silk vestments; and finding that he could carry still more, he put one or two more over each other, and thus cumbrously accoutred, he stole off with a look of terror to his cell; there hiding his ill-got finery beneath his mattress, he laid himself down to continue his nap. Those who had watched him during this interval were willing to see his manner of behaving the morning after

When Cyrillo awaked, he seemed at first a good deal surprised at the lump in the middle of his bed; and going to examine the cause, was still more astonished at the quantity of vestments that were bundled there. He went among his fellows of the convent, inquired how they came to be placed there; and, learning the manner from them, nothing could exceed his penitence and contrition.

His last and greatest project was considered of a still more heinous nature. A lady, who had long been a benefactress to the convent, happening to die, was desirous of being buried in the cloister, in a vault which she had made for that purpose. It was there that she was laid, adorned with much finery, and a part of her own jewels, of which she had great abundance. The solemnity attending her funeral was magnificent, the expenses great, and the sermon affecting. In all this pomp of grief, none seemed more affected than Cyrillo, or set an example of sincerer mortification. The society considered the deposition of their benefactress among them as a very great honour, and masses in abundance were promised for her safety. But what was the amazement of the whole convent the next day, when they found the vault in which she was deposited broken open, the body mangled, her fingers, on which were some rings, cut off, and all her finery carried away! Every person in the convent was shocked at such barbarity, and Cyrillo was one of the foremost in condemning the sacrilege. However, shortly after, on going to his cell, having occasion to examine under his mattress, he there found that he alone was the guiltless plunderer. The convent was soon made acquainted with his misfortune; and, at the general request of the fraternity, he was removed to another monastery, where the prior had a power, by right, of confining his conventuals. Thus debarred from doing mischief, Cyrillo led the remainder of his life in piety and peace.

ANGLING ANECDOTE.

In 1822, two young gentlemen of Dumfries, while enjoying the amusement of fishing at Dalswinton loch, having expended their stock of worms, &c., had recourse to the well-known expedient of picking out the eyes of the dead perches, and attaching them to their hooks—a bait which the perch is known to rise at quite as readily as any other. One of the perches caught in this manner struggled so much when taken out of the water, that the unseen, though not unfelt hook had no sooner been loosened from its mouth than it came in contact with one of its eyes, and actually tore it out. The pain occasioned by this accident only made the fish struggle the harder, until at last it fairly slipped through the holder's fingers, and again escaped to its native element. The disappointed fisher, still retaining the eye of the aquatic fugitive, adjusted it on the hook, and again committed his line and cork to the waters. After a very short interval, the latter substance began to bob, when, pulling up the line, he was astonished to find the identical perch that had eluded his grasp a few minutes before, and which literally perished by *swallowing its own eye!*

HACKSTOUN OF RATHILLET.

Old Hackstoun of Rathillet one day said to Mr Smibert, the minister of Cupar, who, like himself, was blessed with a foolish, or rather wild youth for a son, "D' ye ken, sir, you and I are wiser than Solomon." "How can that be, Rathillet?" inquired the startled clergyman. "Ou, ye see," said Hackstoun, "Solomon didna ken whether his son was to be a fool or a wise man; but baith you and I are quite sure that *our sons are fools.*"

No. 83. SATURDAY, AUGUST 31, 1833. PRICE THREE HALFPENCE.

A SKELETON IN EVERY HOUSE.

WHEN suffering under the pressure of our own distresses, whether they be of regular continuance, or have come upon us of a sudden, we are apt to imagine that no individual in the surrounding world is so unfortunate as we, or, perhaps, that we stand altogether by ourselves in calamity, or, at the most, belong to a small body of unfortunates, forming an exception from all the rest of mankind. We look to a neighbour, and, seeing that he is not afflicted by any open or palpable grievance, and makes no complaint of any which are hidden from our eyes, we conclude that he is a man entirely fortunate and thoroughly happy, while we are never free from trouble of one kind or another, and, in fact, appear as the very step-children of providence. For every particular evil which besets us, we find a contrast in the exactly opposite circumstances of some other person, and, by the pains of envy, perhaps, add materially to the real extent of our distresses. Are we condemned to a severe toil for our daily bread, then we look to him who gains it by some means which appear to us less laborious. Have we little of worldly wealth, then do we compare ourselves with the affluent man, who not only commands all those necessaries of which we can barely obtain a sufficiency, but many luxuries besides, which we only know by name. Are we unblessed with the possession of children, we pine to see the superabundance which characterises another family, where they are far less earnestly desired. Are we bereft of a succession of tenderly beloved friends or relatives, we wonder at the felicity of certain persons under our observation, who never know what it is to wear mourning. In short, no evil falls to our lot but we are apt to think ourselves its almost sole victims, and we either overlook a great deal of the corresponding vexations of our fellow-creatures, or think, in our anguish, that they are far less than ours.

We remember a story in the course of our reading, which illustrates this fallacy in a very affecting manner. A widow of Naples, named, if we recollect rightly, the Countess Corsini, had but one son remaining to give her an interest in the world; and he was a youth so remarkable for the elegance of his person, and every graceful and amiable quality, that, even if he had not stood in that situation of unusual tenderness towards his mother, she might well have been excused for beholding him with an extravagant degree of attachment. When this young gentleman grew up, he was sent to pursue his studies at the University of Bologna, where he so well improved his time, that he soon became one of the most distinguished scholars, at the same time that he gained the affection of all who knew him, on account of his singularly noble character and pleasing manners. Every vacation, he returned to spend a few months with his mother, who never failed to mark with delight the progress he had made, if not in his literary studies, at least in the cultivation of every personal accomplishment. Her attachment was thus prevented from experiencing any abatement, and she was encouraged to place always more and more reliance upon that hope of his future greatness, which had induced her at first to send him to so distant a university, and had hitherto supported her under his absence. Who can describe the solicitude with which a mother—and "she a widow" (to use the language of Scripture)—regards a last-surviving son! His every motion—his every wish—she watches with attentive kindness. He cannot be absent a few minutes longer than his wont, but she becomes uneasy, and, whatever be the company in which she sits at the moment, permits her whole soul to become abstracted in a reverie, from which nothing can rouse her but his return. If he comes on horseback, she hears the foot-fall of the animal, while it is as yet far beyond the ken of ordinary ears: if he be walking, she knows the sound of his foot upon the threshold, though confounded, to all other listeners, amidst the throng of his companions. Let him come into her room on ordinary occasions never so softly, she distinguishes him by his very breathing—his lightest respiration—and knows it is her son. Her entire being is bound up in his, and the sole gorgon thought at which she dare not look, is the idea of his following the goodly and pleasant company with whom she has already parted for the grave. Such exactly were the feelings of the Neapolitan mother respecting her noble and beloved—her *only* son.

It chanced, however, that, just when he was about to return to Naples, perfected in all the instruction which could be bestowed upon him, he was seized suddenly by a dangerous sickness, which, notwithstanding the efforts of the best physicians in Bologna, brought him in three days to the brink of the grave. Being assured that he could not survive, his only care, so far as concerned the living world, was for his mother, who, he feared, would suffer very severely from her loss, if not altogether sink under it. It was his most anxious wish that some means should be used to prevent her being overpowered by grief; and an expedient for that purpose at length suggested itself to him. He wrote a letter to his mother, informing her of his illness, but not of its threatening character, and requesting that she would send him a shirt made by the happiest lady in all Naples, or she who appeared most free of the cares and sorrows of this world, for he had taken a fancy for such an article, and had a notion that by wearing it he would be speedily cured. The Countess thought her son's request rather odd; but being loath to refuse any thing that would give him even a visionary satisfaction, she instantly set about her inquiry after the happiest lady in Naples, with the view of requesting her kind offices after the manner described. Her inquiry was tedious and difficult; every body she could think of, or who was pointed out to her, was found, on searching nearer, to have her own share of troubles. For some time, she almost despaired; but having nevertheless persevered, she at length was introduced to one—a middle-aged married lady—who not only appeared to have all the imaginable materials of worldly bliss, but bore every external mark of being cheerful and contented in her situation. To this fortunate dame, the Countess preferred her request, making the circumstances of the case her only excuse for so strange an application. "My dear Countess," said the lady, "spare all apology, for, if I had really been qualified for the task, I would most gladly have undertaken it. But if you will just follow me to another room, I will prove to you that I am the most *miserable* woman in Naples." So saying, she led the mother to a remote chamber, where there was nothing but a curtain which hung from the ceiling to the floor. This being drawn aside, she disclosed, to the horror of her visitor, a skeleton hanging from a beam! "Oh, dreadful!" exclaimed the Countess; "what means this?" The lady looked mournfully at her, and, after a minute's silence, gave the following explanation. "This," she said, "was a youth who loved me before my marriage, and whom I was obliged to part with, when my relations obliged me to marry my present husband. We afterwards renewed our acquaintance, though with no evil intent, and my husband was so much infuriated at finding him one day in my presence, as to draw his sword and run him through the heart. Not satisfied with this, he caused him to be hung up here, and every night and morning since then, has compelled me to come and survey his remains. To the world I may bear a cheerful aspect, and seem to be possessed of all the comforts of life; but you may judge if I can be really entitled to the reputation which you have attributed to me, or be qualified to execute your son's commission."

The Countess Corsini readily acknowledged that her situation was most miserable, and retired to her own house, in despair of obtaining what she was in quest of, seeing that, if an apparently happy woman had such a secret sorrow as this, what were those likely to have, who bore no such appearance. "Alas," she said to herself, "no one is exempt from the disasters and sorrows of life—*there is a skeleton in every house!*"

When she reached home, she found a letter conveying intelligence of her son's death, which in other circumstances would have overturned her reason, or broken her heart, but, prepared as she was by the foresight of her son, produced only a rational degree of grief. When the first acute sensations were past, she said resignedly to herself, that, great as the calamity was, it was probably no greater than what her fellow-creatures were enduring every day, and she would therefore submit with tranquillity.

The application of this tale, tinged as it is with the peculiar hue of continental manners and ideas, must be easy to every one of our readers. They must see how great a fallacy it is to suppose that others are, more generally than ourselves, spared any of the common mishaps of life, or that *we*, in particular, are under the doom of a severe fate. They may be assured, that, beneath many of the most gorgeous shows of this world, there lurk terrible sores, which are not the less painful that they are unseen. The very happiest-looking men and women, the most prosperous mercantile concerns, have all their secret cankers and drawbacks. The pride of the noble—the luxury of the opulent—even the dignity and worship of the crown—all have a *something* to render them, if it were known, less enviable than they appear. We never, for our part, enter upon any glittering and magnificent scene, or hear of any person who is reputed to be singularly prosperous or happy, but we immediately think of the probability which exists, that our own humble home and condition, disposed as we sometimes may be to repine about them, comprise just as much of what is to be desired by a rational man as the other. Even in those great capitals, where affluence and luxury are so wonderfully concentrated, and all the higher orders appear so singularly well lodged and fed and attended to, we cannot help looking to the other side, and imagining for every one his own particular misery. The houses appear like palaces; but the idlest spectator may be assured of it, as one of the incontrovertible decrees of providence, *that there is a skeleton in every one of them.*

SCOTTISH STREAMS.

THE TAY.

THE Tay is esteemed the largest and most beautiful of all the Scottish rivers, and flowing through an extensive district of country, exhibiting all the varying graces of Highland and Lowland scenery, is believed to pour into the ocean a greater quantity of fresh water than any other river in Britain. The Tay has its remote sources in the western extremity of Perthshire, in the district of Breadalbane, on the frontiers of Lorn, in Argyleshire. At first, its waters are entitled the Fillan, and descend in a winding course of eight or nine miles through a valley, having the name of Strathfillan. In this sequestered vale stands the small modern village of St Fillans, a place now rendered

one of the sweetest spots in Scotland, at least within the Highland line, and which every autumn is rendered a scene of high festival for the celebration of national games.

The little river Fillan afterwards expands, and assumes the form of a lake, called Loch Dochart, extending about three miles in length. Issuing from its eastern extremity, the river retains the name of Dochart, and, under that appellation, flows in an easterly direction through the vale of Glendochart, a distance of eight miles, when again spreading out, but in a much more spacious scale, it forms the splendid sheet of water entitled Loch Tay. This Highland lake extends fifteen miles in length, by from one to two miles, though more generally one mile, in breadth, and possessing a slight serpentine bend, sufficient to take from it the appearance of a straight expanse of water. Its depth is from 15 to 100 fathoms, and it abounds with salmon, trout, pike, and other fish. Although Loch Tay is a spacious and splendid piece of water, and though the surrounding hills are lofty, and its margins are wooded and cultivated, and enlivened by houses, it does not generally afford those fascinating landscapes which characterise Loch Lomond, and other large Scottish lakes; nevertheless, on the southern and less frequented side of the lake, the scenery is often rich and various in the middle grounds. Of the few objects on the northern side, a wooded island, containing the remains of a priory, naturally attracts the first attention. This was an establishment dependent on Scone, founded, in 1122, by Alexander the First, whose queen, Sybilla, the daughter of Henry the First, and grandaughter of William the Conqueror, is interred in it. The island possesses another kind of celebrity, from having afforded a retreat to the Campbells in Montrose's wars. It was taken by General Monk in 1654. Being a picturesque object, it adds much to the beauty of this part of the lake.

The river issuing from Loch Tay at the village of Kenmore, assumes the name of the lake, which it retains till it mingles with the waters of the ocean. The clean, elegant village of Kenmore, with its church, its inn, and its few white cottages, occupies a lovely eminence at the north-east extremity of the loch, and the river is here crossed by a handsome bridge of three arches. Kenmore ranks unquestionably among the most beautiful villages in Scotland; a kind of object, it must be confessed, which Scotland does not yet possess in great numbers. The valley around may be considered as the paradise of the Highlands, and forms a favourite point for the tourist in the genial months of summer. The lower grounds are here richly cultivated, or covered with beautiful plantations; the whole overlooked and sheltered by mountains towering to the clouds, among which rises the lofty Ben Lawers. In the midst of this exquisite scenery, stands the magnificent seat of the Earl of Breadalbane, called Taymouth.

After leaving the lake, the Tay speedily receives a great augmentation by the river Lyon, which descends from Glen Lyon, and runs a course not a great deal shorter than the Tay itself. Its next great accessary is the Tummel, which falls into it on its left bank, joining it at the south-eastern corner of the parish of Logierait, about eight miles above Dunkeld. The Tummel brings down the whole of the waters drained from a most extensive district, or series of vales, in the north and north-west part of the county, from the confines of Mar in Aberdeenshire, round to the borders of Appin in Argyleshire. Before reaching the Tay, it receives these waters chiefly by the rivers Garry, Tilt, Bruar, and Tarff, from the north, and in its own course from the west it draws off the waters of Loch Lyddoch, Ericht, and Rannoch. Thus increased, the Tay becomes a river of uncommon size and beauty, and it now takes a direction more towards the south. Its waters frequently separate and unite again, forming several beautiful islands, and its banks are in general nobly wooded. Near Dunkeld (a place which must be separately described), the woods around it are deep and majestic, and at this place it receives an accession on its right bank by the beautiful river Bran. On leaving Dunkeld, the Tay flows through a territory more lowland in its character, and, pursuing a direction towards the east, receives the waters of the Isla on its left bank. The Isla forms a considerable accession to its magnitude, as it is a stream which, besides draining the north-western part of Forfarshire, draws off the waters from the north-eastern division of Perthshire, by the rivers Ardle, Shee, and Ericht

The Tay now takes a south-westerly course betwixt the parishes of Kinclavin and Cargill, and afterwards resuming a direction more towards the south, it receives on its left bank, at Loncarty, the small river Shochie. About two miles farther south, on the same side, it receives the Almond, which adds considerably to the volume of its waters. Flowing onward towards the south, a noble stream of first-rate proportions, the Tay passes through the beautiful vale and past the town of Perth; and now decreasing in speed, it becomes fit for the navigation of small vessels. After passing between the woods and romantic hills of Kinnoul and Moncrieff, a short way below Perth, the Tay begins to assume the appearance of an estuary or firth; and at the foot of the rich flat vale of Strathearn, it receives on its right bank its last great tributary, the Earn river, which brings down the waters of a most extensive Highland and Lowland district, including those of Loch Earn, whose sources are very near those of the Tay itself.

Having now received the whole of the streams of Perthshire, great and small, with the exception of those falling into the Forth from the south-west corner of the county, the Tay gradually expands into an arm of the sea from a mile to three miles in breadth, though generally shallow; separating the carse of Gowrie and part of Forfarshire on the north, from Fife on the south. At Dundee the firth is contracted to about two miles in breadth, but it again widens, and about eight miles below that thriving sea-port, it expands into the Bay of St Andrews and the German Ocean.

PADDY THE PIPER.

I'LL tell you, sir, a mighty quare story, and it's as thrue as I'm standin' here, and that's no lie—It was in the time of the *'ruction* [insurrection], whin the long summer days, like many a fine fellow's precious life, was cut short by raison of the martial law, that wouldn't let a dacent boy be out in the evenin', good or bad; for whin the day's work was over, not a one of uz daar go to meet a frind over a glass, or a girl at the dance, but must go home, and shut ourselves up, and never budge, nor rise latch, nor dhraw boult until the morning kem agin.

Well, to come to my story—'Twas afther nightfall, and we wor sittin' round the fire, and the pratees was boilin', and the noggins of butther-milk was standin' ready for our suppers, whin a knock kem to the door. "Whisht," says my father; "here's the sojers come upon us now," says he; "bad luck to thim the villains, I'm afeard they seen a glimmer of the fire through the crack in the door," says he. "No," says my mother, "for I'm afther hanging an ould sack and my new petticoat agin it a while ago." "Well, whisht, any how," says my father, "for there's a knock agin;" and we all held our tongues till another thump kem to the door. "Oh, it's folly to purtind any more," says my father; "they're too cute to be put off that-away," says he. "Go, Shamus," says he to me, "and see who's in it." "How can I see who's in it in the dark?" says I. "Well," says he, "light the candle thin, and see who's in it; but don't open the door for your life, barrin' they break it in," says he, "exceptin' to the sojers, and spake thim fair, if it's thim."

So with that I wint to the door, and there was another knock. "Who's there?" says I. "It's me," says he. "Who are you?" says I. "A frind," says he. "*Baithershin*," says I—"who are you at all?" "Arrah! don't you know me?" says he. "Not at all," says I. "Sure I'm Paddy the piper," says he. "Oh, thundher and turf," says I, "is it you, Paddy, that's in it?" "Sorra one else," says he. "And what brought you at this hour?" says I. "I didn't like goin' the roun' by the road," says he, "and so I kem the short cut, and that's what delayed me," says he. "Oh, bloody wars!" says I—"Paddy, I wouldn't be in your shoes for the king's ransom," says I; "for you know yourself it's a hanging matther to be catched out these times," says I. "Sure I know that," says he; "God help me; and that's what I kem to you for," says he; "and let me in for old acquaintance sake," says poor Paddy. "Oh, by this and that," says I, "I darn't open the door for the wide world; and sure you know it; and throth if the Husshians or the Yeo's [yeomen] catches you," says I, "they'll murther you, as sure as your name's Paddy." "Many thanks to you," says he, "for your good intintions; but, plaze the pigs, I hope it's not the likes o' that is in store for me, any how." "Faix then," says I, "you had betther lose no time in hidin' yourself," says I; "for throth I tell you, it's a short thrial and a long rope the Husshians would be afther givin' you; for they've no justice, and less marcy, the villains!" "Faith, thin, more's the raison you should let me in, Shamus," says poor Paddy. "It's a folly to talk," says I; "I darn't open the door." "Oh then, millia murther!" says Paddy, "what'll become of me at all, at all," says he. "Go aff into the shed," says I, "behind the house, where the cow is, and there there's an iligant lock o' straw, that you may go sleep in," says I, "and a fine bed it 'id be for a lord, let alone a piper."

So off Paddy set to hide in the shed, and throth it wint to our hearts to refuse him, and turn him away from the door, more, by token, when the pratees was ready; for sure the bit and the sup is always welkim to the poor thraveller. Well, we all wint to bed, and Paddy hid himself in the cow-house; and now I must tell you how it was with Paddy:—You see, afther sleeping for some time, Paddy wakened up, thinkin' it was mornin', but it wasn't mornin' at all, but only the light o' the moon that decaved him; but at all evints, he wanted to be stirrin' airly, bekase he was going off to the town hard by, it bein' fair-day, to pick up a few ha'pence with his pipes; for not a betther piper was in all the country round nor Paddy; and every one gave it up to Paddy, that he was iligant an the pipes.

[Paddy set off somewhat too early, and as he walked along in the dark, he came against a corpse hanging upon a tree, being the remains of a British officer hanged by the insurgents. Paddy cuts off the limbs of this unhappy victim of popular fury, in order to obtain his boots, and, returning to the cow-house, hides them beneath a heap of straw, after which he went again to sleep, but was soon after seized and taken away by a party of the military. These fragments being afterwards found by the inmates of the cottage, lead to the notion that the cow had eaten up Paddy, and left only his legs behind. The results of this suspicion upon the fair fame of the animal are thus narrated:—]

"Arrah! be aisy," says my father. "Bad luck to the lie I tell you," says I. "Is it ate, Paddy?" says they. "Not a doubt of it," says I. "Are you sure, Shamus?" says my mother. "I wish I was as sure of a new pair of brogues," says I. "Bad luck to the bit she has left iv him but his two legs." "And do you tell me she ate the pipes too?" says my father. "I b'lieve so," says I. "Oh," says he, "what a cruel taste she has for music!" "Arrah!" says my mother, "don't be abusing the cow that gives the milk to the childher." "Yis, I will," says my father; "she shan't be undher my roof any more; for I'll sind her to the fair this minit," says he, "and sell her for whatever she'll bring. Go aff," says he, "Shamus, the minit you've ate your breakquest, and dhrive her to the fair." "Throth I don't like to dhrive her," says I. "Arrah, don't be makin' a gommagh of yourself," says he. "Faith, I don't," says I. "Well, like or no like," says he, "you must dhrive her." "Sure, father," says I, "you could take more care of her yourself." "That's mighty good," says he, "to keep a dog and bark myself;" and I rec'llected the sayin' from that hour. "Let me have no more words about it," says he, "but be aff wid you."

So, aff I wint, and it's no lie I'm tellin', whin I say it was sore agin my will I had any thing to do with sitch a villain of a baste. But, howsomever, I cut a brave long wattle, that I might dhrive the man-ather iv a thief, as she was, without bein' near her at all, at all.

Well, away we wint along the road, and mighty throng it wuz wid the boys and the girls, and, in short, all sorts, rich and poor, high and low, crowdin' to the fair.

"God save you," says one to me. "God save you, kindly," says I. "That's a fine baste you're dhrivin'," says he. "Throth she is," says I, though it wint agin my heart to say a good word for the likes of her. "It's to the fair you're goin', I suppose," says he, "with the baste?" (He was a snug-lookin' farmer, ridin' a purty little gray hack.) "Thin you're right enough," says I; "it is to the fair I'm goin'." "What do you expec' for her?" says he. "Thin myself doesn't know," says I; and that was thrue enough, you see, bekase I was bewildered like about the baste, intirely. "That's a quare way to be goin' to market," say he, "and not to know what you expec' for your baste." "Och," says I, not likin' to let him suspict there was any thing wrong wid her—"Och," says I, in a careless sort of a way, "sure no one can tell what a baste 'll bring, antil they come to the fair," says I, "and see what price is goin'." "Indeed, that's nath'ral enough," says he. "But if you wor bid a fair price before you come to the fair, sure you might as well take it," says he. "Oh, I've no objection in life," says I. "Well, thin, what will you ax for her?" says he. "Why, thin, I wouldn't like to be onraisonable," says I—(for the thruth was, you know, I wanted to get rid iv her)—"and so I'll take four pounds for her," says I, "and *no less*." "No less!" says he. "Why, sure, that's chape enough," says I. "Throth it is," says he; "and I'm thinkin' it's *too* chape it is," says he; "for if there wasn't somethin' the matther, it's not for that you'd be sellin' the fine milch cow, as she is, to all appearance." "Indeed, thin," says I, "upon my conscience she is a fine milch cow." "Maybe," says he, "she's gone off her milk, in regard that she doesn't feed well?" "Och, by this and that," says I, "in regard of feedin' there's not the likes of her in Ireland; so make your mind aisy; and if you like her for the money, you may have her." "Why, indeed, I'm not in a hurry," says he, "and I'll wait till I see how they go in the fair."

"With all my heart," says I, purtendin' to be no ways consarned, but in throth I began to be afeard that the people was seein' somethin' unnath'ral about her, and that we'd never get rid of her at all, at all. At last we kem to the fair, and a great sight o' people was in it; throth you'd think the whole world was there, let alone the standin's o' gingerbread and iligant ribbins, and makins o' beautiful gownds, and pitch-and-toss, and merry-go-roun's, and tints with the best av drink in thim, and the fiddles playin' up t' incourage the boys and girls; but I never minded them at all, but detarmint to sell the thievin' rogue of a cow afore I'd mind any divarshin in life; so an I dhruv her into the thick av the fair, whin, all of a suddint, as I kem to the door av a tint, up sthruck the pipes, and, my jew'l, in a minit the cow cock'd her ears, and was makin' a dart at the tint.

"Oh, murther!" says I, to the boys standin' by, "hould her," says I, "hould her—she ate one piper already, the vagabone, and, bad luck to her, she wants another now."

"Is it a cow for to ate a piper?" says one o' thim.

"Not a word o' lie in it, for I seen his corps myself, and nothin' left but the two legs," says I; "and it's a folly to be sthrivin' to hide it, for I *see* she'll never lave it aff, as poor Paddy Grogan knows to his cost."

"Who's that takin' my name?" says a voice in the crowd; and with that, shovin' the throng a one side,

who should I see but Paddy Grogan, to all appearance.

"Oh, hould him too," says I; "keep him av me, for it's not himself at all, but his ghost," says I; "for he was kilt last night, to my sartin knowledge, every inch av him, all to his legs."

Well, sir, with that Paddy—for it *was* Paddy himself, as it kem out afther—fell a laughin', and, whin he kem to himself, he ups and he tould uz how it was, as I tould you already; and the likes av the fun they made av me was beyant tellin', for wrongfully misdoubtin' the poor cow, and layin' the blame of atin' a piper an her. So we all wint into the tint to have it explained, and we dhrank health and long life to Paddy and the cow; and Paddy played that day beautifully, and mony a one said the likes was never heard before or since, even from Paddy himself, and av coorse the poor slandered cow was dhruv home agin, and many a quiet day she had wid uz afther that; and whin she died, throth my father had sitch a regard for the poor thing, that he had her skinned, and an iligant pair of throwsers made out iv her hide, and it's in the fam'ly to this day; and isn't it mighty remarkable it is, what I'm goin' to tell you now, but it's as thrue as I'm here, that from that out, any one that has thim things an, the minit a pair o' pipes sthrikes up, they can't rest, but goes jiggin' and jiggin' in their sate, and never stops as long as the pipes is playin'."*

THE PIRATES OF THE ARCHIPELAGO.

It is curious to observe how far the fanciful impressions of infancy will sometimes extend their shadows into after life. From my childhood, though I scarce knew why, the Ægean Archipelago had always been "one of the greenest islands of my imagination." Hence, when I found myself sailing by moonlight over its still waters, with its hundred isles of light flourishing and looking beautiful around me, I could scarcely realise my situation, or believe that I was actually in the middle of that very ocean, hallowed by so many lovely and glorious associations, and the goal of all the warmest and most romantic aspirations of my youth.

I visited the various Greek islands, in company with a valued friend, in the spring of last year. We hired for the cruise a small Greek goëlette, manned by Hydriote sailors, and carrying two swivel guns of tolerable size. This was a necessary precaution; for the whole of the Archipelago swarmed with pirates, and every fresh port we touched at we learned some new example of their daring and success, and too often of their cruelty. They had sprung up suddenly in the month of March, and had appeared in several quarters at the same time; and it was conjectured, from their numbers and extraordinary audacity, that they must be supported by some high authority, and act under explicit directions. They were composed, so far as could be discovered, of individuals from all nations, chiefly Syriac, Egyptian, and Greek. They attacked vessels of all sizes, and bearing all flags. Near Milo they had captured a Sardinian brig, and subjected the crew to every species of abominable outrage; and at Syria we received an account, which proved afterwards only too correct, of these miscreants having seized two Austrian vessels of considerable size in the Gulf of Salonica. The crews made a gallant resistance, and the pirates in revenge took them to the island of Thasos, and after subjecting them to the most ignominious treatment, massacred them all. These circumstances, as may be imagined, were constantly present to our thoughts, and we proceeded on our voyage cautiously and anxiously. One night, as we were sailing between Tinos and Delos, leaning over the side of our vessel, and watching the bright and fairy phosphorescence of the dividing waves, my friend related to me the following incident, which I will give nearly in his own words:—

"Not long since I had occasion to pass in a Venetian brig from Alexandria to Smyrna, and as I was desirous to take this opportunity of becoming acquainted with the Ægean, the captain, at my request, visited a few of the more interesting islands. One day in May we were lying off the north-east coast of the island of Naxos, enjoying the freshening softness of the evening air after a day of excessive sultriness. At sunset the wind gradually died away, and gave place to one of those dead, motionless calms so common in these uncertain seas. We had watched with melancholy interest the last gleams of the departing sun, as he disappeared behind the wooded hills of Antiparos, and were now enjoying the soft dim lustre of the moon as she rose upon the lovely scene before us. Syra, Delos, and other isles, dimly discernible in the distance, formed the chief features of the landscape, while the rich moonlight softly glimmered on the almost motionless bosom of the waters.

Occasionally a slight ripple against the sides of the vessel awoke the slumbering phosphorescence of the ocean, and elicited a light which had something of enchantment both in its delicacy and its evanescence. There was a stillness—a calmness—a surpassing beauty—a sacred purity, in the scene, which inspired one with the thoughts and the language of another world; and as I gave way to the reveries and remembrances it awakened, I almost lost the recollection of our meaner nature, and forgot that I was still on earth.

In this mood of mind I was leaning over the side of the vessel, when the captain came and tapped me gently on the shoulder, and, with a look of peculiar significance, pointed to an abrupt promontory about two miles a-head of us. I followed his eye, and could distinguish with difficulty two long narrow boats, with three small masts in each, and impelled apparently by nearly twenty oars, making straight for our vessel. As they came more distinctly into view, and we could discern their form, it was such as to leave us no doubt of their nature or intentions. We had heard them described too often and too minutely not to recognise them at a glance: they were a band of those terrible pirates who were then infesting the Ægean, and whose daring and cruelty had struck terror into all the sailors who frequent these seas. I looked at the captain. He was a brave man, I knew, for I had seen him tried; yet now his lip quivered, and a shuddering came over his whole frame, as he saw, in all its horrors, the fate which was probably in store for us. We knew that our chance of a successful resistance was but small; but weak as it was, we had learned enough of the brutality of these wretches in other cases to be aware it was our only hope. Outrage, ignominy, and massacre, had been inflicted, according to the varying caprice of the hour; and in particular, their treatment of the crews of two vessels which had lately fallen into their hands, determined us to fight to the last plank, and then take what fate it might please Providence to send us.

Escape was impossible. There was not a breath of air sufficient even to stir a handkerchief; and these pirates always profit by a calm, which enables them to attack an unwieldy vessel to great advantage. We got all our arms on deck, and each man stood ready at his post. I had laid my sword and pistols on the gunwale before me, and was leaning on my carbine, watching the advance of the enemy. There was a dead silence through the ship, till we could distinctly hear the splashing of their oars as they gradually neared us:—it was horrible to be thus deserted by the elements at our greatest need. There was not breeze or motion sufficient to enable us even to turn the vessel; and there was not one of us who would not thankfully have exchanged our helpless, motionless condition, against the wildest hurricane that ever blew over a tropical sea. We were delivered up to our enemies, as it were, bound hand and foot. This feeling of paralysis grew upon us momently, like the horrors of nightmare. Every man seemed afraid to breathe, and we might have heard a pin drop at the furthest extremity of the ship. We were looking Death in the face—and I felt that he was indeed the King of Terrors.

The boats at length came within hail. I counted thirty men in the one boat, and twenty in the other; we did not muster twenty-five in all. They rowed close alongside, one at one side, and the other at the other, and summoned us to surrender. The captain returned no answer, but took a deliberate aim with his musket at the summoner, and shot him through the heart. We all followed his example, and our fire was eminently successful. They returned it in haste, and then, without waiting to reload, began to climb the sides of our vessel. We offered them no resistance, but retired to the quarter-deck, where our two small cannon had been placed, and ranged ourselves before them. As soon as the pirates had clambered upon deck, without waiting to form, they drew their heavy cimetars and yataghans, and rushed tumultuously upon us. In a moment we drew a little to either side, and at the same instant our two guns poured their grape-shot, through our ranks, upon the confused mass of our assailants. The effect was tremendous; for a moment we thought the victory was ours, and we rushed upon them to complete our work. But they rallied too quickly, and then began the real contest: it was man to man—hand to hand—sabre to sabre. The pirates were desperate by character—we were rendered so by situation; and the combat was one of such deep and concentrated fury as I trust never to witness again. Two of the combatants who were firmly grappled, and were slashing each other with their daggers, missed their footing on the quarter-deck, and fell overboard together. But even in the water I could observe that they did not quit their hold; each grasped his antagonist with the frenzy of a dying man, and they sank in each other's arms. How long the battle lasted I know not: it might be five minutes—it might be ten; but I was brought to the ground I scarce knew how; and when I recovered my senses, it was all over.

Myself and six of my companions were the sole survivors: they were all wounded, and tied with ropes to the side of our vessel. The captain was among them. His arms were pinioned behind him, and he was lashed to the mainmast. He was evidently faint and weak from loss of blood, and his pale countenance expressed a sort of hopeless resignation, interrupted at times by a transient shudder of unconquerable horror, as the thought of the fate in store for us rushed across his mind. The pirates, whose numbers had been greatly thinned during the action, were lying on the quarter-deck, some sleeping, and others watching. The first faint streak of morning light was just appearing along the horizon, and our conquerors took advantage of a breeze which sprung up to direct our vessel towards their port. Just then a ship of considerable size came in sight round the corner of the island, and passed us within a few hundred yards. Our captain, regardless of the consequences, hailed the strange sail, and claimed the assistance of her crew, and at the same moment received a shot which silenced him for ever. The pirates sprung to their feet, and prepared to receive those we had called upon to save us. They had seen our situation, but they turned a deaf ear to our entreaties; they spoke not—turned not—staid not. The ship of safety speeded on its way; and as it gradually lessened in the distance, our excited hopes sunk into despair, and our hearts died away within us.

I am an observer both by habit and disposition, even in times of the deepest anxiety and danger; and as a faint gleam of hope, in the shape of an accepted ransom, had already flashed across my mind, I began to look out, with a sort of throbbing curiosity, mingled with alarm and doubt, for the pirates' den, whither our course was evidently directed. It was not long before we arrived. Six of the pirates immediately proceeded southward with our captured ship, for the purpose, as we afterwards found, of selling her at Rhodes, with the inhabitants of which island they kept up a regular traffic of this nature. The remainder of our victors got into their two boats, whither we were compelled to follow them, and pulled towards shore. I despair of being able to delineate, otherwise than with the pencil, the extraordinary scene we now approached. It was a bold, craggy, almost perpendicular coast; and we soon discovered a vast chasm or fissure, which extended the whole height of the rock, and to a considerable depth inland. Into this chasm we entered, and, after rowing about fifty yards, another considerable fissure opened at right angles to the first. Though at least sixty yards broad at the level of the water, this second chasm gradually diminished in breadth, till at the surface of the island its existence was only discernible by a narrow crack over which an active man might leap with ease. At the end of this extraordinary natural vault, and about twenty feet above the sea, was a cave, narrow at its entrance, but widening considerably as it penetrated deeper into the rock, and by no means dissimilar to the subterranean gallery underneath the citadel of Argos. As the pirates moored their boats at the extremity of this vast cavern (for such, notwithstanding the narrow opening above, it might be called), two of their associates appeared at the mouth of the cave to welcome them, and inquire of their success. A few words were interchanged between them, and my companions and I were then ordered to mount into the cave by means of a ladder of ropes, which was let down to the boat's edge. To one of these unfortunate wretches the moment seemed to offer a last chance for safety. When his turn came to ascend, he pretended to lose his hold, slipped into the water, dived under the nearest boat, and swam vigorously away. But the effort proved a desperate one; the pirates were too vigilant to be thus deceived; three firelocks were discharged at the unhappy man too deliberately to miss the mark—he gave a horrid shriek, which is still ringing in my ears—stretched forth his hands wildly and imploringly to Heaven—then slowly sunk beneath the surface; and the bubbles which ascended one by one from his last suffocating gasps, alone indicated the spot where he had disappeared.

We were all struck with horror. It seemed to us a foreboding of our own fate, and we shuddered as we entered this dark cavern of iniquity. There seemed to be many recesses in different directions; but the part of the cave where the pirates were assembled was nearly circular, and a rude lamp, which was suspended from the damp vault, served to show the dreariness and discomfort of the chamber, and the mats and weapons which formed its only furniture.

I will not detail to you the horrors of our situation, nor the ignominious treatment to which we were subjected, during our abode in the pirates' den. It was living with the devil and his angels. My four remaining companions were taken out of the cave at midnight, about a week after our arrival, and put on board one of the pirates' boats, and I had afterwards reason to believe that they were sold as slaves in some of the ports of Syria. I only escaped their fate from having been able to persuade the pirates, by producing my papers, that if my friends at Smyrna were informed of my situation, they would willingly advance whatever ransom might be demanded; and I pledged myself at the same time that I would never attempt to make known their residence. I wrote to Smyrna, and an answer soon arrived. The pirates, impatient for their promised ransom, immediately conveyed me to *Scala Nuova*, the port of the ancient Ephesus, where my friends met me, and I was delivered up to them on payment of the stipulated sum. It was two thousand dollars.

As I rode towards Smyrna, the world seemed to have opened afresh afore me: I was disposed to look upon every thing with a favourable eye. Even the miserable village of Aiasaluck appeared rich and beautiful; all nature was bright and laughing; and I felt that I had taken out a new lease of life.

The same pirates are now infesting the Archipelago; and, from the description, I believe them to have been the very gang who last month massacred the Austrian crews at the Isle of Thasos. But I remembered my promise, and not even a robber shall have to reproach me with a breach of trust."

This was the substance, and nearly the words, of my friend's narrative; and, from many confirmatory statements which I heard both in Greece and Smyrna,

* From "Legends and Stories of Ireland, by Samuel Lover, R.H.A."

I am inclined to believe that there is neither incorrectness nor exaggeration in the smallest circumstance.

We continued our voyage without any interruption, beyond that of frequent calms; and after visiting Syra, Delos, and Scio, we reached Smyrna on the 25th of May.*

POPULAR ERRORS IN MEDICINE.

By an Edinburgh Physician.

A very common practice in eating such fruit as cherries is to swallow the stones, with the vague notion that these promote digestion. No error can be more fatally absurd. Many cases have occurred where such practices have been the cause of death, and that of a most excruciating nature. One instance is on record of a lady who died in great agony after years of suffering, and the cause was found to be several large balls found in the intestines, accumulated around clusters of cherry-stones. The husks of gooseberries are often swallowed with the idea that they prevent any bad effects from the fruit. On the contrary, they are the most indigestible substance that can be swallowed, and pass the stomach without any change, although they cause excessive irritation, and not unfrequently inflammation of the bowels.

Many people put great faith in the wholesomeness of eating only of one dish at dinner. They suppose that the mixture of substances prevents easy digestion. They would not eat fish and flesh, fowl and beef, animal food and vegetables. This seems a plausible notion, but daily practice shows its utter absurdity. What dinner sits easier on the stomach than a slice of roast or boiled mutton, and carrots or turnips, and the indispensable potato? What man ever felt the worse of a cut of cod or turbot followed by a beef-steak, or a slice of roast beef and pudding? In short, a variety of wholesome food does not seem incompatible at meals, *if one do not eat too much*—here the error lies.

It is a common practice with bathers, after having walked on a hot day to the sea-side, to sit on the cold damp rocks till they cool before going into the water. This is quite erroneous. Never go into the water if over-fatigued, and after profuse and long-continued perspiration, but always prefer plunging in while warm, strong, and vigorous, and even with the first drops of perspiration on your brow. There is no fear of sudden transitions from heat to cold being fatal. Many nations run from the hot bath, and plunge naked into the snow. What is to be feared is sudden cold after exhaustion of the body, and while the animal powers are not sufficient to produce a reaction or recovery of the animal heat.

There is a favourite fancy of rendering infants and farther advanced children hardy and strong, by plunging them into cold water. This will certainly not prevent strong infants from growing stronger, but it will and often does kill three children out of every five. Infants always thrive best with moderate warmth and a milk-warm bath. The same rule applies to the clothing of infants and children. No child should have so light clothing as to make it feel the effects of cold—warm materials, loose and wide-made clothing, and exercise, are all indispensable for the health of little ones. But, above all things, their heads should be kept cool, and generally uncovered.

Many people so laud early rising as would lead one to suppose that sleep was one of those lazy, sluggish, and bad practices, that the sooner the custom was abolished the better. Sleep is as necessary to man as food, and as some do with one-third of the food that others absolutely require, so five hours' sleep is amply sufficient for one, while another requires seven or eight hours. Some men cannot by any possibility sleep more than four or five hours in the 24; and, therefore, true to the inherent selfishness of human nature, they abuse all who sleep longer. No man should be taunted for sleeping eight hours if he can.

There is a common prejudice in the country, that old women, farriers, and professed bone-setters, are the only persons fit to prescribe for all sprains, dislocations, and broken bones. Are these subjects less likely to be understood by an anatomist and regularly educated man, than the more difficult and intricate diseases which he daily treats with success? What becomes of all such patients in large cities and hospitals, where a regular surgeon superintends their cure? Have we so many stiff joints and deformed and useless limbs as among the patients of the empirical bone-setter?

Many people do not eat salt with their food, and the fair sex have a notion that this substance darkens the complexion. Salt seems essential for the health of every human being, more especially in moist climates such as ours. Without salt, the body becomes infected with intestinal worms. The case of a lady is mentioned in a medical journal, who had a natural antipathy to salt, and never used it with her food; the consequence was, she became dreadfully infected with these animals. A punishment once existed in Holland, by which criminals were denied the use of salt; the same consequence followed with these wretched beings. We rather think a prejudice exists with some of giving little or no salt to children. No practice can be more cruel or absurd.

One great cause of reluctance to medicine among the ignorant, is the idea, that many, if not all of the powders and potions, are made from human bones, and other parts of the body. In the present day no such thing exists; but yet nothing can better exemplify the saying, "that popular prejudices are the cast-off clothes of philosophers, in which the rabble dress themselves," than the fact that even the great Lord Bacon believed in amulets; and Boyle seriously recommends the thigh-bone of an executed criminal as a powerful remedy in dysentery. Two-thirds of the medicines in common use are the dried roots, or leaves, or fruits, or gums of vegetables, reduced to powder, or infused in water or spirit of wine; the other third are salts, obtained from sea-water, from the waters of mineral springs, from burnt sea-weed or land vegetables, and from various preparations of the metals. Many a child has turned with horror and disgust from a common emetic powder, under the false conception that it was human liver pounded, when he would have even cheerfully taken off the nauseating draught had he been told that it was nothing more than the clean-scraped roots of a beautiful little flowering plant, that grows in warm countries, called ipecacuan. It is not an uncommon observation, and a sort of taunt, too, to the medical man, that his drugs are all disagreeable to the palate. People do not reflect that this is a wise provision of nature. What, for instance, would be the consequence if the fruit, whose pulp bears the bitter purging colocynth, were as inviting to the taste as a pine-apple? Or how could the ignorant be restrained from every day poisoning themselves, if foxglove, hemlock, or henbane, bore sweet and enticing fruits?

Another general reproach among the uninformed, is, that, in the present day, physicians disdain to employ in their prescriptions the native plants of this country. This reproach is quite unfounded; there is never a day that some one of our native vegetables are not prescribed; but, undoubtedly, some of our most active and most valuable medicines can only be procured from hotter climates.

BIOGRAPHIC SKETCHES.

SPENSER.

Passing over an interval of more than a century and a half from the death of Chaucer, during which no noted poetical genius appeared in England, with the exception of Sir Philip Sidney, at the commencement of Elizabeth's reign, we meet with Spenser, the celebrated author of the Fairy Queen.

Edmund Spenser was descended from an ancient family in Northamptonshire, and was born in London in 1553. In 1576, having completed his degrees in arts, he stood for a fellowship, in which he was unsuccessful; and this disappointment, joined with the narrowness of his circumstances, forced him to quit the university. He now went to live in retirement at the house of a friend in the north of England, and became here enamoured of the Rosalind whom he finely celebrates in his pastoral poems, and of whose cruelty he has written very pathetical complaints. It is probable, that, about this time, his genius first began to distinguish itself; for the Shepherd's Calendar, which is so full of his unprosperous passion for Rosalind, was amongst the first of his works of note, and the supposition is strengthened by the consideration of poetry's being frequently the offspring of love and retirement. This work he addressed, by a short dedication, to Sir Philip Sidney. It was in 1578, that, at the persuasion of his friend Mr Harvey, Spenser removed to London, where that gentleman introduced him to the notice of Sidney, who was now in the highest reputation both for wit and gallantry, and the most popular of all the courtiers of his age; and as he was himself a writer, and especially excelled in the fabulous or inventive kind of poetry, it is no wonder he was struck with our author's genius, and became sensible of his merit. By this universal patron of genius, he was presented to Queen Elizabeth, who honoured him with the place of poet-laureate; but, through the ill will of Lord Treasurer Burleigh, the queen's favours to this unhappy great man were intercepted, and he for some time wore only a barren laurel, possessing merely the place without the pension.

About this time he finished his poem entitled "The Shepherd's Calendar," which was first printed in 1579; and in the following year, being recommended by his patron to the Earl of Leicester, he went to Ireland as secretary to the Lord Grey of Wilton, then appointed Lord Lieutenant of that kingdom. Lord Grey was recalled in 1582, and with him Spenser returned to London, where he continued till after the death of Sir Philip Sidney, who was killed at the battle of Zutphen, in the Low Countries, in 1586, an event which our poet bewailed to the end of his life.

The following year, Spenser, having obtained a royal grant of 3000 acres of forfeited lands in the county of Cork, in Ireland, set out for that kingdom, took possession of his estate, and fixed his residence in the castle of Kilcolman, which had belonged to the Earl of Desmond. Much about this time he contracted an intimate friendship with the great and learned Sir Walter Raleigh, who was then a captain under the Lord Grey. The poem of Spenser's, called "Colin Clout's come home again," in which Sir Walter is described under the name of the Shepherd of the Ocean, is a beautiful memorial of this friendship, which took its rise from a similarity of taste in the polite arts, and which he agreeably describes with a softness and delicacy peculiar to him. Sir Walter afterwards promoted him in Queen Elizabeth's esteem, through whose recommendation she read his writings.

In his retirement at Kilcolman he resumed his great work, the Fairy Queen, and continued in Ireland till the year 1589, when he came over to England with Sir Walter Raleigh, but returned to Ireland the year following, where he fell in love with a merchant's daughter, and married her. Soon after his marriage, he paid another visit to his native country, where we also find him in 1596. In the following year he returned once more to Kilcolman; but on the rebellion of Lord Tyrone, who ravaged the whole county of Cork, he was obliged to fly for safety with his family to England, where, in the year 1599, he died in extreme poverty. This account of his death is given principally on the credit of the celebrated Drummond of Hawthornden, who says he had it from the English poet Ben Jonson; but it has since been discovered, by examining the patent roll, that, in February 1591, Spenser obtained from Queen Elizabeth an annuity of L.50 during his life, a sum equivalent to about L.200 at present. He was buried in Westminster Abbey, near Chaucer, according to his request, and a monument was erected to his memory by Ann Countess of Dorset.

Spenser's principal poem, the "Fairy Queen," is a sort of continued allegory, or a series of metaphorical legends, strung together in rather an unconnected manner. He raises up a hero for every one of his adventures, and endows each of them with some particular moral virtue, which renders them all equal, without subordination or preference; only prince Arthur, by whom he means Sir Philip Sidney, is made to shine throughout the whole poem, and succours the rest when they are in distress. The original of every one of his knights was then living in the court of Queen Elizabeth; and he attributed to each of them that virtue which he thought was most conspicuous in them—an ingenious piece of flattery, which, however, did not turn much to his account. Had he lived to finish his poem in the remaining legends, it had certainly been more of a piece, but could not have been perfect, because the model was not true. Prince Arthur, or his chief patron, Sir Philip Sidney, dying before him, however, deprived the poet both of means and spirit to accomplish his design.

Spenser has had many imitators among the poets of modern times, and several have written in his style with very considerable success. "To imitate the fictions and sentiments of Spenser," says Dr Johnson, "can incur no reproach, for allegory is perhaps one of the most pleasing vehicles of instruction. But I am very far from extending the same respect to his diction or his stanza. His style was, in his own time, allowed to be vicious, so darkened with old words and peculiarities of phrase, and so remote from common use, that Ben Jonson boldly pronounces him *to have written no language*. His stanza is at once difficult and unpleasing; tiresome to the ear by its uniformity, and to the attention by its length. It was at first formed in imitation of the Italian poets, without due regard to the genius of our language."*

Notwithstanding the opinion here given by the learned doctor in regard to the Spenserian stanza, it must be remarked that this stanza has been used with great success by several of our distinguished poets in some of their most popular productions; particularly by Waller, Thomson, Burns, Beattie, Byron, and Tennant. By far the most successful imitation of the style and manner, as well as of the stanza of Spenser, which is to be found in the English language, is Thomson's admirable poem of the Castle of Indolence, in which it may safely be affirmed that he has carried the palm, and has left his master in every respect far behind.

THE PILGRIMAGE TO MEKKA.

In the Mahometan world, as is perhaps well known to many of our readers, it is judged of great importance that a pilgrimage to Mekka should be performed at some period during the life of a true believer. The city to which the pilgrimage is made derives its distinction from its having been the birthplace of Mahomet; it is a town of about thirty thousand stationary inhabitants, situated in a narrow valley in the province of Hedjaz, in Arabia Felix, but, instead of being possessed of any natural advantages, is represented as surrounded by a barren country, and the scene of poverty and misery all the year round, except at the period when the pilgrims are residing in it. Every year, about seventy thousand Musselmans arrive before it, many of them from very remote countries, such as the Malay coast on the one hand, and Barbary on the other, and almost all of them having, in their journey, endured the extreme of those hardships

* From "Sketches in Greece and Turkey," recently published by Ridgway, London.

* Vide The Rambler, No. 121.

which are inseparable from travelling in a warm and dry region. The number, in recent times, has generally been found almost exactly what is stated, which may be considered fortunate for the reputation of an old popular belief, that, in the event of there being any fewer, the deficiency would be supplied by angels from heaven.

Previous to the publication of Burckhardt's travels, the Christian world possessed little information respecting the pilgrimage to Mekka, by reason of the Mahometans threatening with death every individual of a different faith, who should mingle with the true believers on that occasion. Burckhardt, a young German student, of enthusiastic character, ventured, in the year 1814, to subject his person to this dreadful hazard, in order that he might be able to describe the ceremonies; and so masterly was his performance of his assumed character, so well did he talk the necessary language, so little did he falter in the required formalities, that he came off undetected. We propose to give such of our readers as may not have perused the excellent book, afterwards published by this gentleman, an idea of what he saw.

There is a place at a certain distance from Mekka, where pilgrims are required to throw off their usual clothes, and assume an uniform called the *ihram*, consisting of two pieces of white cloth, one of which is fastened round the loins, and the other round the shoulders, while the head remains uncovered. To this custom, which has often the most fatal effects, Burckhardt at once conformed. It is also customary, on reaching the holy city, as it is called, to visit the temple or mosque, whether the stranger be a pilgrim or not; and with this custom our traveller also complied. He found the Beitullah—for so a part of the mosque is called—to be a large quadrangular building, like some markets in Britain, consisting of an immense number of columns, of all kinds of material, which join at the top in Gothic arches, and support domes above. From the arches hang lamps, which are lighted every night during the month of the pilgrimage, and give a strikingly gay and singular appearance to the whole temple. The Caaba, which is the mosque proper, stands in the centre of the square, an oblong massive structure, built of large blocks of different sized stones, joined rudely together, and with bad cement, about 18 paces in length, 14 in breadth, and from 35 to 40 feet in height. The door, which is on the north side, is wholly plated with silver, and embellished with gilt ornaments. Near the door, in the inside, is a black stone, held in peculiar veneration, and supposed by Mr Burckhardt to be of a basaltic nature. The interior of the Caaba is hung with black silk cloth, blazoned all over with inscriptions, in gold letters, "There is no God but God, and Mahomet is the apostle of God," which may be called the fundamental dogma of the Mahometan faith. In the neighbourhood of the temple is the well of Zemzem, which is drunk copiously by the pilgrims, under the idea that it purifies them from their sins.

The prescribed ceremonies are, first, to repeat certain prayers in different parts of the temple; then to begin the *towaf*, or walk round the Caaba seven times, kissing the black stone at each circuit; then to proceed to the well of Zemzem, and drink as much water as they wish or can get. The second ceremony which the pilgrim has to perform, is, to proceed to the hill of Szafa, and there repeat certain prescribed prayers before he sets out on the holy walk, or *say*, which is along a level spot, about six hundred paces in length, terminating at a stone platform, called Meroua. This walk, which in certain places must be a run, is to be repeated seven times, the pilgrims reciting prayers uninterruptedly, with a loud voice, the whole time. The third ceremony is that of shaving the head, and walking to the Omra, about one hour and a half from Mekka, chaunting pious ejaculations all the way. The two former ceremonies must after this be again repeated. The walk round the Caaba seven times may be repeated as oft as the pilgrim thinks fit, and the more frequent the more meritorious.

When all the required ceremonies have been gone through, the whole concourse of pilgrims repair together on a certain day to Mount Arafat, some on camels, some on mules or asses, and the greater number barefooted, this being the most meritorious way of performing a journey of eighteen or twenty miles. "We were several hours," says Burckhardt, "before we could reach the outskirts of the town, so great was the crowd of camels. Of the half-naked hadjis [pilgrims], all dressed in the white *ihram*, some sat on their camels, mules, or asses, reading the Koran, some ejaculating loud prayers, whilst others cursed their drivers, and quarrelled with those near them, who were choking up the passages." Having cleared a narrow pass in the mountains, the plain of Arafat opened out. Here the different caravans began to disperse, in search of places to pitch their several tents. Hadjis were seen in every direction, wandering among the tents in search of their companions, whom they had lost in the confusion along the road; and it was several hours before the noise and clamour had subsided.

In the morning, Burckhardt ascended the summit of Mount Arafat, from whence he counted about 3000 tents, dispersed over the plain, of which two-thirds belonged to the two Hadj caravans, and to the suite and soldiers of Mohammed Ali; but the greater number of the assembled multitudes "were," says our traveller, "like myself, without tents." Those of the wife of Mohammed Ali, the mother of Tousoun and Ibrahim Pasha, were magnificent—the transport of her baggage alone, from Djidda to Mekka, having required 500 camels.

"Her tent was in fact an encampment consisting of a dozen tents of different sizes, inhabited by her women; the whole inclosed by a wall of linen cloth, 800 paces in circuit, the single entrance of which was guarded by eunuchs in splendid dresses. Around this inclosure were pitched the tents of the men who formed her numerous suite. The beautiful embroidery on the exterior of this linen palace, with the various colours displayed in every part of it, constituted an object which reminded me of some descriptions in the Arabian tales of a Thousand and One Nights."

Mr Burckhardt says, he estimated the number of persons assembled on the plain at 70,000; but whether any or how many of them were supplied by "angels," he does not say. This enormous mass, after washing and purifying the body according to law, or going through the motions where water was not to be had, now pressed forward towards the mountain of Arafat, and covered its sides from top to bottom. At the appointed hour, the cadi of Mekka took his stand on a stone platform on the top of the mountain, and began his sermon, to which the multitude appeared to listen in solemn and respectful silence. At every pause, however, the assembled multitudes waved the skirts of their *ihrams* over their heads, and rent the air with shouts of "Lebeyk, allahuma lebeyk!"—"here we are at thy commands, O God!" "During the wavings of the *ihrams*," says Burckhardt, "the side of the mountain, thickly crowded as it was by the people in their white garments, had the appearance of a cataract of water; while the green umbrellas, with which several thousand hadjis, sitting on their camels below, were provided, bore some resemblance to a verdant plain." The assemblage of such a multitude—to every outward appearance humbling themselves in prayer and adoration before God—must be an imposing and impressive spectacle to him who first observes it, whether Mahommedan, Christian, Jew, or Pagan. "It was a sight, indeed," says Pitts, "able to pierce one's heart, to behold so many thousands in their garments of humility and mortification, with their naked heads, and cheeks watered with tears, and to hear their grievous sighs and sobs, begging earnestly for the remission of their sins." Burckhardt mentions the first arrival of a black Darfoor pilgrim at the temple, at the time when it was illuminated, and from 8000 to 10,000 persons in the act of adoration, who was so overawed, that, after remaining prostrate for some time, "he burst into a flood of tears; and, in the height of his emotion, instead of reciting the usual prayers of the visitor, only exclaimed, 'O God, now take my soul, for this is paradise!'"

As the sun descended behind the western mountains, the cadi shut his book; instantly the crowds rushed down the mountain, the tents were struck, and the whole mass of pilgrims moved forward across the plain on their return. Thousands of torches were now lighted; vollies of artillery and musketry were fired; skyrockets innumerable were let off; the pasha's bands of music were played till they arrived at a place called Mezdelfé, when every one lay down on the bare ground wherever he could find a spot. Here another sermon was preached, commencing with the first dawn, and continuing till the first rays of the sun appear, when the multitude again moved forward, with a slow pace, to Wady Muna, about three miles off. This is the scene for the ceremony of "throwing stones at the devil." Every pilgrim must throw seven little stones at three several spots in the valley of Muna, or twenty-one in the whole, and at each throw repeat the words, "In the name of God—God is great—we do this to secure ourselves from the devil and his troops."

This "stoning" occupies a day or two, after which comes the grand sacrifice of animals, some brought by the several hadjis, others purchased from the Bedouins for the occasion, the throats of which must always be cut with their faces towards the Caaba. At the pilgrimage in question, the number of sheep thus slaughtered "in the name of the most merciful God," is represented as small, amounting only to between 6000 and 8000. The historian Kotobeddyn, quoted by Burckhardt, relates, that, when the Khalif Mokteder performed the pilgrimage, in the year of the Hejira 350, he sacrificed on this occasion 40,000 camels and cows, and 50,000 sheep. One is at a loss to imagine where, in such a miserable country, all these thousands and tens of thousands of camels, cows, and sheep, can possibly be subsisted; the numbers may be exaggerated, but there is no question of their being very great. The feast being ended, all the pilgrims had their heads shaved, threw off the *ihram*, and resumed their ordinary clothing; a large fair was now held, the valley blazed all night with illuminations, bonfires, the discharge of artillery and fireworks; and the hadjis then returned to Mekka. Many of the poorer pilgrims, however, remained to feast on the offals of the slaughtered sheep. At Mekka the ceremonies of the Caaba and the Omra were again repeated, and then the hadj was truly performed.

Burckhardt remained at Mekka a whole month after the conclusion of the hadj, at which time it appeared like a deserted town. "Of its brilliant shops, one-fourth only remained; and in the streets, where a few weeks before it was necessary to force one's way through the crowd, not a single hadji was seen, except solitary beggars, who raised their plaintive voices towards the windows of the houses which they supposed to be still inhabited. Rubbish and filth covered all the streets, and nobody appeared disposed to remove it. The skirts of the town were crowded with the dead carcases of camels, the smell from which rendered the air, even in the midst of the town, offensive, and certainly contributed to the many diseases now prevalent."*

The superstitious rites now performed at Mekka, are few, if any of them, the invention of Mahomet: they are referred to a much remoter antiquity than even his time, or are supposed to have at least been engrafted on old Arabian superstitions. The Arabs, it is well known, or at least the wandering portion of them, are descended from Ishmael, the son of Abraham; and it is still an excuse of the Bedouins for robbing their peaceful neighbours, that they are thereby only revenging the injustice done to their great ancestor. The well of Zemzem is accordingly symbolical of the spring of water which burst forth in the wilderness, at the moment when Hagar was witnessing her infant son ready to perish of thirst; and the alternate running and walking between Szafa and Mekka, sometimes running back and sometimes stopping, like one who has lost something, is supposed to represent Hagar seeking water for her unfortunate child. It is the decided opinion of Burckhardt that the ceremonies are not now performed with the zeal that formerly existed, and that Mahometanism is on the decline.

THE WOES OF A COUNTRY SURGEON.

UNDER this head we do not mean to particularise any single individual of the fraternity, but to treat of them generally, as a harassed and persecuted race—not persecuted by human beings like themselves, but by a thousand unfortunate necessities incident to their calling, which are, in as far as we know, unparalleled in the history of any other profession or employment. This assertion may be lightly treated by some who have never considered the subject with the attention we have been led to bestow upon it, but will have its full weight with those who have. The lawyer, for instance, though he toils many weary hours over a set of musty papers, is still allowed the shelter of his own house, with its other comforts. If the clergyman is called upon sometimes to visit a penitent and dying parishioner at the dark hour of midnight, such occurrences are to him few and far between. The sailor must take his watch, it is true, and now and then encounters a storm; but then he knows to a certainty when he will be relieved from his watch, and that the storm cannot long continue. The soldier may undergo long and fatiguing marches, and be exposed to the shock of battle; but he contemplates the end of the campaign with the hope that he will then be allowed to rest in his bed. But, alas, no such hope ever comes to soothe the bosom of the unfortunate country surgeon, who, having been unbedded perhaps for three or four successive nights, lays him down at last with wearied limbs and an aching head, while a horrible presentiment, which already acts on him like an incubus, persuades him that he will no sooner have fallen into a deep and renovating sleep, than the ponderous knocker appended to his door will summon him to resume his seat on the everlasting saddle. Thus, even the time which might be appropriated to rest is disturbed by the very *fear of being disturbed*. Nay, he seems for ever under the dominion of some malignant influence. It is not sufficient that he is seldom allowed that repose which nature demands; but this denial is, moreover, frequently accompanied by the most provoking circumstances. The time is winter, and he returns when night is far advanced to his own home, after having for hours braved the bitter blast, which, loaded with hail and sleet, has been shooting its sharp pellets into his face, while every part of him is penetrated with the most extreme cold. Well, he arrives, we say, at length at this much longed for haven, throws off his greatcoat and assumes his slippers, draws his chair towards a bright and cheerful fire, and, having rubbed his hands before it, till their red and raw condition is so far amended as to give hopes of their being able to extract the cork from a bottle of ale or porter, which has been, meanwhile, attaining a comfortable temperature, he seizes the bottle with one hand and the screw with the other, and by anticipation sees the welcome draught already mantling and foaming in the capacious tumbler which stands before him. But, hark! a galloping horse approaches, and the fearful knocker clamours, and rebounds, and clangs again, in such a boisterous fashion, that it seems to say, he who commits this furious assault upon it comes on an errand of life and death that will admit of no delay. Presto! the screw drops from the hand of its wretched owner, and the bottle is set down on the table, for he hears the sound of coming feet upon the stairs, which he knows full well by instinct to be those of the unwelcome man of the knocker; and by the same instinct he kicks off his slippers, and looks ruefully towards the corner where he threw his boots, while too surely the door opens to usher in an anxious husband, the need of

* We have used the abridgement of the Quarterly Review, No. 33.

whose better half brooks no delay. To think of rest and its appliances were now impossible nor dares he so much as to ask one longing, lingering look towards the tantalizing draught he had meditated, lest he should create alarm in his guest, and, having drawn on his boots, and hastily resumed his greatcoat, he presently finds himself once more facing the storm, "with slackened bit and hoof of speed." Yet, to make the matter worse, perhaps he and his own trusty nag, whose frequent contact with each other has formed them into a sort of Centaur, guided by the same will, antipathies, and predilections, are not now allowed the privilege of journeying together, the cruel separation being insisted on by the impatient messenger, who, to expedite the matter, mounts the unfortunate doctor on his own broken-winded, broken-kneed, or spavined jade, while he awaits the saddling of the better steed, and follows in the rear. In short, all hours and all seasons have their woes and disappointments for this unhappy man of whip and spur. Is he invited to a feast, a wedding, or a pic-nic, the same envious demon seems to follow him; and just when mirth and glee are at their height, and he begins to forget his woes and taste enjoyment, some unlucky "native of Snatchaway" tracks his steps, and drags him, it may be ten or twelve miles off, to set a leg or an arm, which some old man or woman has chosen to break upon that day, above all the days in the year.

Yet are there two alleviations of the country surgeon's lot, without which he could not survive his fatigues, and which he enjoys in common with his more fortunate brethren, whose town practice calls for less exertion: these are, the privilege of mitigating the sufferings of his fellow-creatures, and the satisfaction of receiving his small and well-earned fee.

THE MODERN JEWS.

(Third Article.)

The historical anecdote of Rabbi Akiba, who, in A.C. 135, was summoned before Turnus Rufus, the Roman general, and during the progress of his interrogations, remembering that it was the hour of prayer, fell on his knees, regardless of the presence of the Roman, and of the pending trial for life and death, and calmly went through his devotions, is an apt illustration, even at this distant day, both of the profound reverence which the Jews have for the order of their ritual, and their enthusiastic faith in the sanctity of prayer. Happily, the age we live in affords no opportunity of offering a parallel example of devout piety; but it is nevertheless certain, that the modern Jews, like their ancestors, turn aside at the hour of prayer from all worldly pursuits, to perform their devotions, which they conceive paramount to all other duties. They permit no circumstance, however pressing, no situation, however inconvenient, not even when traversing the public streets, to interrupt or prevent that undeviating observance of daily worship which their religion requires.

The prayers of the Hebrews sympathise deeply with the fallen state of the race, and are generally uttered with a corresponding fervour, such as is rarely exemplified by other worshippers. This characteristic feature is particularly manifested when a Hebrew pronounces the prayer of the declaration of the nature of the one true God, which is always done with closed eyes, that the thoughts may be freed from the interruption of surrounding objects, and with an emphasis which invariably excites the surprise and interest of any strangers who may witness it. This prayer is that part of Scripture comprised between the fourth and ninth verses (inclusive) of the sixth chapter of Deuteronomy. The fourth verse is viewed by the Jews as the foundation-stone upon which the structure of their religion rests; and to confirm this verse in its most literal meaning, to rescue it from all qualification or reservation, the tenets and discipline of modern Judaism mainly tend. Children are early taught to repeat this prayer. It is introduced into the morning and evening service, and forms part of the prayer said on retiring to rest. As before observed, it forms part of the prayers inclosed in the phylacteries, and it also forms part of those inclosed in the lintels. It is the consolatory prayer in the hour of peril, the prayer of friends surrounding the death-bed; it is the prayer of the dying. To have consciousness sufficient at that awful moment to repeat this prayer, is regarded by the Jews a death rather to be envied than bewailed.

The afternoon and evening services comprise principally a repetition of the prayer of the eighteen verses, and that of the prayer just mentioned. As both these prayers have been largely noticed, comment on this part of the daily worship is unnecessary, and we therefore pass on to the prayer said on retiring to rest, our extracts from which afford another splendid specimen of Hebrew piety and genius.

"Blessed art thou, O Lord our God, Sovereign of the Universe, who causest the bands of sleep to descend on my eyes, and slumber on mine eyelids. May it be thy pleasure, O Lord my God, and the God of my fathers, that I lie down in peace, and rise up again in peace; and that bad dreams, or evil imaginations, do not confound me; but grant me an uninterrupted repose in thy presence. O enlighten my eyes again, lest I sleep in death. Blessed art thou, O Lord, who enlighteneth the whole universe with thy glory!"

"O Lord our God, cause us to lie down in peace, and raise us up again, O our King, alive. O spread thy pavilion of peace over us, uphold us with thy good counsel, and help us for thy name's sake. Protect us, and remove away from us foes, pestilence, war, famine, and grief. O remove the enticer from being about us, and cover us under the shadow of thy wings; for thou, O God, art our keeper and deliverer. Thou Omnipotent art a most merciful and gracious King. O preserve our going forth, and our coming in to life and peace, for now and for evermore."

"For thy salvation do I hope, O Lord; I hope, O Lord, for thy salvation; O Lord, for thy salvation do I hope." (This is repeated three times.)

"Stand in awe, and sin not; commune with your heart upon your bed, and be silent. Selah."

Although the day's devotions end here, these prayers do not comprise all the daily worship. Every hour of the day, every act of every hour, has its appointed prayer, that man may ever have in mind his dependence on his Maker. In support of this inference, may be deduced the following remarkable prayers on various minor occurrences in common life:—

BEFORE TASTING ANY THING NEW IN ITS SEASON.

"Blessed art thou, O Lord our God, King of the Universe, who hast preserved our lives, sustained us, and brought us to the enjoyment of this season."

EXTRACT FROM THE GRACE AFTER MEALS.

"Blessed art thou, O Lord our God, King of the Universe. Thou art he who doth feed all the world with kindness, with grace, with favour, and with mercy; who giveth food to every creature, and whose mercy endureth for ever: this, through his abundant goodness, hath never failed us, nor will it ever fail us, even to eternity, because of his great name; for he is the God who feedeth and sustaineth all, who dealeth beneficently with all, and who provideth food for all the creatures he hath created. Blessed art thou, O Lord, who feedeth all."

ON BEHOLDING A RAINBOW.

"Blessed art thou, O Lord our God, King of the Universe, who art mindful of the covenant, faithful to thy covenant, and firm in thy promise."

ON BEHOLDING THE FIRST BUDDING OF BLOSSOMS.

"Blessed art thou, O Lord our God, King of the Universe, who doth not suffer aught to fail in his world, but hath created thereon goodly creatures, and trees, for the enjoyment of mankind."

ON WITNESSING A THUNDER STORM.

"Blessed art thou, O Lord our God, King of the Universe, whose power and might filleth the world."

ON SEEING LIGHTNING.

"Blessed art thou, O Lord our God, King of the Universe, primeval Creator."

The *order* of the ritual for the Sabbath is, with one exception, the same as that for daily worship. The prayers, however, are different, being conformable, and alluding to that holy day. The exception referred to is the ceremony of the sanctification of the Sabbath, a description of which will conclude our notice of the private devotions of the modern Jews. Our readers are probably aware that the Jewish Sabbath commences at the Friday's setting sun, in accordance with the sacred history of the creation, "and the evening and the morning were the seventh day." On returning from the synagogue on that evening, the master of every house proceeds to the sanctification alluded to. Seated at the head of his table, upon which bread, salt, and consecrated wine, are conspicuously displayed, lighted candles arranged ceremoniously on either side the bread, while the Sabbath lamp, containing seven burners, is suspended from the ceiling, and surrounded by his family, pious and attentive in their demeanour, he commences with the following words:—

"The evening and the morning were the sixth day, on which the heavens and the earth were formed, and all their host; and on the seventh day God ended his work which he had made: thus he rested on the seventh day from all his work which he had made. And God blessed the seventh day, and sanctified it; because thereon did God rest from his works which he had created and made."

Pouring out the wine, he repeats—

"Blessed art thou, O Lord our God, King of the Universe, Creator of the fruit of the vine. Blessed art thou, O Lord our God, King of the Universe, who doth sanctify us with his commandments, and hath delighted in us, and with love and favour hath entailed us with the holy Sabbath, as a memorial of the work of the creation; for this day was the first of those called holy. It is a remembrance of the going forth of Egypt; for thou hadst chosen us, and sanctified us above all people, and with love and favour hast made us to inherit thy holy Sabbath. Blessed art thou, O Lord, who sanctified the Sabbath."

Taking hold of the bread, he says—

"Blessed art thou, O Lord, who bringeth forth bread from the earth."

He then divides the bread, handing a piece to each person present, all of whom repeat the blessing. When finished, the children, according to seniority, present themselves before their parents respectively, and, saluting them with "Good Sabbath," crave their blessing. With both hands placed on the head of the child, the parents thus express themselves—

"May the Lord bless and preserve thee; may the Lord cause his face to shine upon thee, and be gracious unto thee; the Lord lift up his countenance towards thee, and grant thee peace."

NATURAL HISTORY.

THE STRIPED HYÆNA.

Naturalists long ranked hyænas as dogs; but the acute Cuvier has detected a very striking difference in the formation of the teeth, and has in consequence formed a new genus for them, under the name of Hyæna. The hyæna is about the size of a large dog, and usually measures about nineteen inches in height at the shoulders, the ordinary length of the body, from the muzzle to the tail, being generally three feet three inches; the hair is of an ash-colour, very coarse and rough, variegated with long black waved stripes, which commence at the spine, and continue down the sides and under the belly; the legs have irregular rings of black; the neck and back are provided with a hog-like bristly mane; and the tail is covered with long stiffish hairs. Its fur is composed of two sorts of hair, one of which is woolly, and very small in quantity, and the other of a silky texture, long, stiff, and not very thick, excepting on the limbs, where the hair is short and close; and has the appearance of being shaven on the muzzle.

The striped hyæna is a native of Asiatic Turkey, Barbary, Egypt, Nubia, Abyssinia, Syria, Persia, and many other parts of Africa, where it resides in caverns of mountains, clefts of rocks, or burrows dug by itself. It is of an exceedingly ferocious and malignant disposition, and although taken very young, can never be thoroughly domesticated. The courage of the hyæna is equal to its rapacity: it will defend itself against much larger animals, and has been known to combat even with the lion and the panther, and is said to be more than a match for the ounce. The hyæna generally hunts for its prey during the night, and attacks every living animal it meets with; cattle are often killed by it, and sheep-folds are frequently devastated by this rapacious animal. Hyænas have been known to collect in vast troops, and following an army, feasting on the dead left behind on the battle-field: it has been also said, that when pressed with hunger they will even ransack the repositories of the dead, and greedily devour putrid carcasses. Like the dog, wolf, and fox, with which they are closely allied, they will also subsist on the roots of plants and the shoots of palms, but this is only when they cannot procure animal food.

The cry of the hyæna is very peculiar and dismal: its commencement is somewhat like the moaning of a human being, and ends like a person making a violent and strained effort to vomit. Although naturally extremely ferocious, it has been in a few instances rendered tolerably domestic. Buffon mentions one at Paris which was apparently freed from his natural destructive qualities; and Pennant says he saw one nearly as tame as a dog.

Mr Bruce, while in Africa, confined a hyæna in the same apartment with a lamb, a goat, and a kid, for a whole day, and even without giving the hyæna any food, and he found his harmless companions quite safe in the evening. Bruce says the hyænas of Abyssinia prowl about in the day-time as well as at night. "These creatures," says he, "were a general scourge to Abyssinia, in every situation, both in the city and in the field, and, I think, surpassed the sheep in number. Gondor was full of them, from evening till the dawn of day, seeking the different pieces of slaughtered carcasses which this cruel and unclean people expose in the streets without burial. Many a time in the night, when the king had kept me late in the palace, and it was not my duty to lie there, in going across the square from the king's house, not many hundred yards distant, I have been apprehensive lest they should bite me in the leg. They grunted in great numbers about me, although I was surrounded by several armed men, who seldom passed a night without wounding or slaughtering some of them."

We are told by Mr Pringle that hyænas are the general scavengers of the country, never failing to devour the carcasses, and in great part the skeletons, of dead animals, and the refuse left by other beasts of prey; and we have his authority, as well as that of Mr Brown, that they even devour their own species when they find a dead one. Mr Pringle says, that the flesh of the spotted hyæna is so rank and offensive that no other beast of prey but their own species will come near it. At Dar Fûr, in the interior of Africa, hyænas enter the villages every night in small herds of from six to fifteen, and carry off every animal they are capable of destroying. Dogs, asses, and horses, are frequently their victims; and if they meet with a dead camel, they generally contrive to remove it, and are not to be intimidated by either man or the discharge of fire-arms.

The ancients entertained many absurd and unaccountable notions respecting the hyæna. They believe that its neck consisted of but one bone, which was without a joint; that it every year changed its sex; that it could imitate the human voice, and had thus the power of charming shepherds, and rivetting them to the place on which they stood. Pliny says, "there is not a wild beast of the field that the magicians have so much in admiration as the hyæna; for they hold that in the hyæna itself there is a certain magical virtue, attributing to it a wonderful power of transporting the mind of man or woman, and so ra-

vishing their senses that it will allure them to her in a strange manner."

Mr John Hunter had at Earle's Court a hyæna, nearly 18 months old, that was so tame as to allow strangers to approach and touch him. After Mr Hunter's death, he was sold to a travelling exhibitor of animals. For a few months previous to his being carried into the country, he was lodged in the Tower of London. He was so gentle there that he allowed a person who knew him to enter his den and handle him. When he was confined in the caravan, he soon exhibited symptoms of ferocity equal to those of the most savage of his kind. He was at last killed by a tiger, the partition between whose den and his own he had torn down by the enormous strength of his jaws.

The hyæna in confinement is allowed four pounds weight of food in the day, and he laps about three English pints of water.

A curious circumstance of a hyæna is mentioned by Mr Bruce, who says, "One night at Maitsha, being very intent on an observation, I heard something pass behind me towards the bed, but upon looking round could perceive nothing. Having finished what I was about, I went out of my tent, resolving directly to return, which I immediately did, when I perceived two large blue eyes glaring at me in the dark. I called up my servant with a light, and we found a hyæna standing near the head of the bed, with two or three large bunches of candles in his mouth. To have fired at him would have been at the risk of breaking my quadrant or other furniture, and he seemed, by keeping the candles steadily in his mouth, to wish for no other prey at that time. As his mouth was full, and he had no claws to tear with, I was not afraid of him, and with a pike struck him as near the heart as I could. It was not till then that he showed any sign of fierceness; but, upon feeling his wound, he let drop the candles, and endeavoured to run up the shaft of the spear to arrive at me, so that I was obliged to draw my pistol from my girdle and shoot him, and nearly at the same time my servant cleft his skull with a battle-axe. In a word, the hyæna was the plague of our lives, the terror of our night walks, and the destruction of our mules and asses, which, above every thing else, are his favourite food."

THE SPOTTED HYÆNA.

The spotted hyæna inhabits Southern Africa, abounding in the neighbourhood of the Cape. The mane of this species reaches only to the loins, and the remaining part consists chiefly of scattered hairs. The general colour of the spotted hyæna is reddish-brown, marked with cross bars on the hind-legs; the head is much larger than that of the other species, and flat; its ears are large, flat, and rounded.

The spotted hyæna has great muscular strength in its neck, and its voice is still more remarkable than that of the common hyæna; it commences with a strange hollow sound, and ends in a hoarse kind of laugh, from which circumstance it has obtained the name of the laughing hyæna.

Dr Sparman relates the following story of the spotted hyæna:—"One night, at a feast near the Cape, a trumpeter, who had got himself well filled with liquor, was carried out of doors in order to cool and sober him. The scent of him soon attracted a spotted hyæna, which threw him on his back, and carried him away to Table Mountain, thinking him a corpse, and consequently a fair prize. In the meantime, however, our drunken musician awaked, sufficiently sensible to know the danger of his situation, and to sound the alarm with his trumpet, which he carried fastened to his side. The beast, as may easily be imagined, was not less frightened in its turn." Another writer observes, that any person but a trumpeter in such a situation would doubtless have furnished the animal with a supper.

Barrow, in his Travels in Southern Africa, mentions that the spotted hyæna has been completely tamed. He says, "The cadaverous *crocuta* has lately been domesticated in the Snowberg, where it is now considered one of the best hunters of the game, and as faithful and diligent as any of the common sorts of domestic dogs;" and Bishop Heber says he saw a gentleman in India with a hyæna so completely tamed, that it followed him about like a dog, and fawned on those with whom he was acquainted, and gives this as an instance of how much the poor hyæna is wronged when he is described as untameable.

The den of a spotted hyæna which was kept in the Tower about sixteen years ago requiring some repairs, the carpenter completed them by nailing on the floor a thick oak plank of seven or eight feet in length, with at least a dozen nails, each longer than the middle finger of the hand. At one end of this plank, however, there was a small piece left, that stood up higher than the rest, and the man not having a proper chisel along with him to cut it off, he returned to his shop for one. During his absence, some persons came in to see the animals, and the hyæna was let down by the keeper from the other part of the den. He had scarcely entered the place before he discovered the piece that was left at the end of the plank, and, seizing it with his teeth, tore it completely up, drawing every nail with the utmost facility.

A soldier, about sixteen years ago, visited the royal menagerie, and brought along with him a small terrier dog, which he knew to be possessed of great courage. He ridiculously held him up to the den of the hyæna. On seeing the animal, the dog became irritated, and in his rage thrust his head between the bars, when the hyæna sprang upon him, dragged him through, and almost instantly devoured him.

Connected with the history of the hyæna, is the curious fact of numerous bones of these animals having been found in different parts of Europe in a fossil state, from which it has been inferred that this animal had originally been a native of Europe, and even of Britain. For, in a cavern at Kirdale, in Yorkshire, a large collection of these bones were recently discovered; and they have also been found at Crawly Rocks, near Swansea, in Wales, in the Mendip hills at Clifton; at Wirksworth, in Derbyshire; at Paviland Cave, Glamorganshire; and Creston, near Plymouth.

Professor Buckland contends that the animals whose bones have thus been found must have lived and died in the vicinity of the different situations in which they have been discovered.

Baron Cuvier says, that the bones of the fossil hyæna indicate the size of an animal which must have been somewhat larger than the striped species, and the teeth are formed like those of the spotted animal, but somewhat larger, so that their powers of gnawing must have considerably exceeded those now existing.

Column for Boys.

My Dear Young People—If you will listen attentively for a few minutes to a friend, who loves you sincerely, who respects you for many kind good qualities in which you surpass many that are your seniors, and has hitherto done all in his power for your information and amusement, he would fain endeavour to impress you with a few advices, which he conceives would tend, if properly acted upon, to make you much more agreeable both to yourselves and others, than perhaps some of you now are.

Violence in your sports, speaking and doing that which wounds the feelings of each other, cruelty to crazy and outcast fellow-creatures, and the abuse of works of nature and art, are the faults which I would particularly wish to see extirpated in your generally amiable race, and to which I am now to direct your attention.

By violence in your sports, I mean an undue turbulence and outrageousness which some of you introduce into your play, to the fear and disgust of all rational grown-up persons who may happen to behold your proceedings. What you *should* do in play, is to take such exercise as may improve the health of your bodies, and refresh and relax your minds after study. For these purposes many of the ordinary sports are quite adequate; and I can assure you that your seniors, so far from grudging you such sports, feel a sincere pleasure in seeing you engaged in them. What they would wish to see you avoid, is, any improper extreme in your exertions, any dangerous exploit, and in general all those rough gambols which tend only to the destruction of your clothes, and to shock the senses of those who behold them. Grown-up people often observe with pain that some of you take a kind of pleasure in spoiling and breaking. You soil, without compunction, the clothes which your mother and her servants have taken so much pains to clean, and grind down unnecessarily the shoes which your father, poor man, has to work so hard to obtain for you. All this frivolity of yours, while it can be of no service to yourselves, produces real distress of mind to your parents, who have perhaps to suffer much hardship, and want many things they would like to have for themselves, in order that they may replace what you have so wantonly destroyed. You should pause a moment in your fun, to reflect upon these things; and I feel very sure that the generosity which lies at the bottom of all your natures, however overlaid by recklessness and love of play, would soon inform you how far you are wrong, and put you upon a better way for the future. You could not hesitate for a moment to give up rude and ungentlemanlike practices, which at once disgrace yourselves, and cause grief and embarrassment in a quarter where you have so much reason to desire to see the reverse.

I would also like to see some improvement in the way in which you conduct yourselves towards each other. Among many of you, there is a lamentable want of civility. You never hesitate to do or say any thing, from an apprehension of its being disagreeable to the feelings of your neighbours. Not that you do not both do and say many kind things to each other; the fault is, that you are not regularly governed by any desire of avoiding what is painful to your fellows. Many of you are never withheld from outraging the feelings of a neighbour, by any other consideration than that he is perhaps able to beat you at a fight. You respect him from fear of his blows—not, as you ought to do, from the idea that he is a person who has feelings to be injured as well as yourself. Hence, in the same degree that you truckle to your superiors in strength, you domineer over your inferiors. If you only think that a boy has not the vigour or the courage to pommel you, you are very apt to insult him by contemptuous language, if not also to fall a-beating him for mere sport. I have thus known boys of gentle disposition, and of good intellectual capacity, tyrannised over in the most shameful manner by boys who in reality were inferior to them in every respect, but were bolder and more wicked. I have known cases of such boys persecuted and pestered for months by their little tyrants, till their lives were almost a burden to them. Now, my dear young friends, this is not only very wrong in a moral point of view, but, what will strike your minds far more strongly, it is highly ungenerous and shabby. Only think how you would like to be yourselves insulted or beaten, without provocation, by the boys who are bigger than you, or by men who are able to beat any of you—how cruel and unmanly you would consider such persons to be—how bitterly you would feel towards them! Surely, if it would be painful to you, it must be as painful to those whom you insult or beat; if you would consider your tyrant as cruel and unmanly, they whom you beat would be justifiable in thinking the same of you, and in execrating you with the same degree of bitterness. And if you occasionally act the tyrant, how much must it add to your chagrin when you are yourself beaten or insulted—how much must it take away from your just cause of complaint, to recollect that you are yourself guilty of the same fault, whenever you can find a boy sufficiently weak or small for your purpose. The boy who habitually beats his inferiors, must also, on that account, look additionally contemptible in the eyes of his companions, when he is himself beaten. An inoffensive boy would in such a case have the chance of being commiserated, or of having somebody to interfere and take his part; but every thwack bestowed upon a wretch who takes pleasure in thrashing his lesser companions, must give a pleasure to the onlookers, and carry with it a pain and ridicule more than its own. Boys, in general, would do well to take an example in this, as in most other respects, from men. Among the latter, there prevails a mode of speech and behaviour which bears the common title of politeness. No man considers himself entitled, because he is stronger, to beat or use opprobrious language to his neighbour. If they were to do so, the whole would become wild savages once more, and there would be no rational pleasure in human life. But, by treating each other with respect and deference, even though in many cases it be the result of no sincere feeling, the self-love of each man is preserved, and all are as good to each other, and do as much to promote the general happiness, as possible.

I now come to speak of the third fault, which consists in a disposition very prevalent among young people, to bait and enrage such unfortunate creatures as insanity, misery, or perhaps intoxication, have exposed upon the streets to this species of persecution. Whenever any poor wretch of weak intellects appears in public, and manifests an oddity of behaviour, the attention of the boys is attracted. If the unhappy being shows any impatience or anger, his juvenile train becomes a gang of persecutors, teasing, insulting, and tormenting him by all means in their power. No regard for the terrible misfortune which has rendered this poor creature so susceptible of insult: the only thing considered is, that here we have a person whose vain resentment and attempts at retaliation furnish us with some fun. In the same way, we have seen a poor tipsy beggar, male or female, exposed to vexations and torments of the most revolting kind. In vain did the grey hairs of the wretched outcast stream in the wind; in vain flaunted the miserable rags, which spoke so eloquently of abject poverty; if he only would *speak back*, or foolishly try to seize and make an example of one of his hornet-like retinue, on went the ruthless crowd, shouting every kind of insult in his ears, plucking his skirts whenever an opportunity offered, and even perhaps making stones and sticks come occasionally athwart his staggering, fatuous, and dilapidated person. Now, my dear young friends, I must make free to tell you that this species of behaviour is the most wicked and detestable that you could possibly display. It rather resembles the conduct which we attribute to fiends, than that which human beings are ever found to display at any other period of life. Persons such as I have described are marked already by the sacred hand of Providence as devoted to misery; and for man to presume to add new wretchedness to their fate, is more than cruel—it is impious.

The last point upon which I intend to address you, is one to which I entreat your particular attention. Many little boys, and, I am sorry to add, many grown persons too, who ought to know better, manifest a vicious inclination to destroy works of art, or other objects not protected by inclosures, or which the people are allowed to see gratuitously. Now, this is a very base propensity, which, strange to say, is to be found in almost no country except our own. How frequently do we perceive the effects of this lamentable violence! In public walks and parks we see the seats cut, broken, or wasted in some way or other; the young trees and flowering shrubs torn up by the roots; and the monumental erections which ornament these places abused, if not utterly spoiled in appearance—all from a sheer wanton spirit of destruction, having no good end, and tending to put the public or private individuals to much pain and serious pecuniary loss. I am exceedingly sorry to say that this shameful practice is equally common in England as in Scotland, in cities and towns as well as in country places. It is likewise common even in the most sacred edifices. The public were at one time freely admitted to Westminster Abbey, and walked through it daily as a thoroughfare; the consequence was, that soon all the statues

were broken and defaced; every little projection, such as the hands, the noses, and even the heads of the figures, were broken off by violence. So the public were prevented from going freely through this magnificent structure, and enjoying the grandeur of the place, merely because boys could not resist the temptation of assailing the defenceless monuments. Similar instances of wanton mischief are every where common; and is it not disgraceful to British youth that they should behave so ill, and allow themselves to be outdone in virtuous feeling by the boys, nay, by the very lowest orders of society in France, where all works of art are preserved with great care, and where a boy would be ashamed to be found meddling with these harmless inanimate objects, planted as ornaments in places of public resort? Now, my dear little boys, I would fain hope, that such of you as are liable to these censures will henceforth endeavour to avoid giving occasion for them. In this matter act upon a resolute principle of rectitude: never, on any account, throw stones at the windows of uninhabited houses; never deface fingerposts or milestones; never write names or words upon walls; never obliterate with your fingers newly-painted letters on signboards, or other places; never cut or injure the seats in public walks; never deface any statue or work of art within your reach; never tear up or take away the flowers and trees which decorate the gardens to which you have free admission; in short, conduct yourselves always as becomes rational beings, amenable to censure and disgrace. I am fully sensible of the absurdity of expecting more from young people than their nature and capacity will admit of, and do not hope ever to see old heads, as the proverb says, placed upon young shoulders. Nevertheless, I make almost sure that you will profit somewhat by the advices of one, whom you know to be so anxious for your improvement and general welfare.

ANIMAL VITALITY.

The instances of animals found alive in stone and wood, after having been immured there for a long period of time, are among the most wonderful phenomena presented by natural history. All our readers must be aware of the frequent occurrence of toads in the centre of large blocks of solid stone; but they may have heard less of creatures found in other substances. In December 1822, a very curious discovery was made at the saw-mill near Stratford, in Essex. In adzing the edges of an inside plank of the zebra-wood—one of the hardest and driest kinds of timber imported into this country—a creature of the Cerambyx species was cut in two. The workman, on searching farther, and with some care, found another of the same kind, which he carefully preserved. It was two inches long, the colour darker than a cinnamon-brown; and what, considering its place of residence, was most wonderful, the head was armed with two delicate feelers, twice the length of the body. The animal was at first in a torpid state; but on being carried to the house of Mr Clift, a neighbouring naturalist, and placed near a fire, it recovered animation, and ate some brown sugar very greedily. Being placed in a warm situation, it lived till the 15th of January, taking very little nourishment except milk and water. It was kept upon a chimney-piece on some twigs of a tree, under a bell-glass; so that perhaps the temperature might have been too high, and its powers too much excited, to allow it to live through the winter. How its feelers had been disposed in the wood, seemed one of the most surprising circumstances connected with this creature: while alive, it usually carried these antennæ over its back, but occasionally brought them forward. Having ten joints in each, it had the power of folding them on its body.

Another instance of animal vitality prolonged under similar circumstances, occurred a few years before.

A clerk in one of the courts at Guildhall had been often staggered, if not frightened, during his labours, by the sound of something like what superstition has named the *death-watch*, too near his desk to bode any good to him. This old desk had been a court appendage for a number of years;* and our clerk's astonishment may be surmised, when, one day, his attention being peculiarly attracted by the ticking noise, he first saw a minute hole perforated to the surface from the inner wood, and soon after a portion of the insect-instrument by which this operation was performed, protruded. With his penknife he carefully enlarged the orifice, and ultimately succeeded in digging out an animal resembling the Cerambyx of the zebra-wood, but of brilliant colours and smaller dimensions. This specimen was presented to Sir J. Banks, and is, we presume, still in the collection left by him.

The inferences which may be drawn from these memorable phenomena, we leave to the natural philosopher: in a popular point of view, they are worth recording for their extreme curiosity.

* The office at Guildhall had been fitted up with desks of American oak or wainscot, about ten years before, by Mr Dance, the city architect. The insect, and the appearance of the cavity which contained it, are figured, if we are not mistaken, in one of the volumes of the Linnæan Transactions, but not having that work at hand, we cannot refer to it.

THE MICHIGAN TERRITORY.

The Michigan territory, lying on the east side of Lake Michigan, and belonging to the United States, is now acknowledged to be among the most fertile districts, and the best adapted for the settlement of emigrants, of any part of North America. "The *prairies*, or flat meadow lands, in this quarter (says an American authority quoted by Mr Fergusson of Woodhill), are of the richest soil, and may be ploughed in two days after the frost leaves the ground in the spring. They usually produce 30 or 40 bushels of wheat to the acre; and from 30 to 80 of corn have been raised from the same quantity of ground in all the prairies that have as yet been occupied: 400 acres of corn were cultivated on Beardsley's prairie last year, which, having been improved the year before, averaged 50 to the acre. These prairies not unfrequently produce 30 or 40 bushels of corn to the acre the first season, without being ploughed or hoed after planting. The surveyed part of the territory is divided into two United States' land districts, containing each one land-office; one of which is situate at Detroit, the other at St Joseph's. The seat of government for the territory is the city of Detroit. It is pleasantly situated on Detroit river, between Lakes Erie and St Clair, about 25 miles from the former, and seven from the latter, in lat. 42° 18′ north, containing at present about 2500 inhabitants, many of whom are French. It is daily improving, and is destined to be one of the most important ports on the north-western frontiers, not only on account of the safety and commodiousness of its harbour, but also in consequence of its extensive inland commercial advantages, as it possesses steam-boat and sloop navigation to Buffalo, Sault de Ste, Marie, Michillimackinac, Green Bay, and Chicago.

It contains a court-house, jail, academy, council-house, and two banks; a Presbyterian, an Episcopalian, Methodist, Baptist, and Catholic church; an arsenal, magazine, and commissary store-house. The rivers Grand, St Joseph, Raisin, Huron, Clinton, Rouge Kalamazoo, and Shiawassee, interlocking in different parts of the territory, not only irrigate the country in a beautiful manner, but offer unparalleled inducements for canalling, and with comparatively but little expense, as there would be no mountains, nor probably rock strata, to cut through. It is already in contemplation, by means of the Grand River, and Clinton, or the St Joseph's and Raisin, to open a water communication across the Peninsula, by means of a canal, which would terminate at Detroit or Monroe; and probably at no very distant period it will not only be undertaken, but will be accomplished in such a manner as to accommodate both these places in this respect. A company was incorporated by an act of the legislature last fall, under the title of the 'Summit Portage Canal and Road Company,' with a capital of D.10,000, to be divided into 1000 shares of D.10 each, for the purpose of cutting a canal west of Lake Michigan, to connect the Fox and Ouisconsin rivers, at what is usually termed the Portage of the Ouisconsin, and to construct a turnpike road on said Portage, parallel to said canal; and also to construct another turnpike road from the lower extremity of the rapids of the Kaukaunin, on the east side of Fox River, on the most direct and eligible route to Winnebago Lake, and for the erection of piers, wharfs, warehouses, and other public buildings and improvements, in and about said canal and turnpike, for commercial purposes. Michigan extends at present west to the Mississippi river; but it is expected the territory will shortly be divided, and a new territory set off west of Lake Michigan, and organized by the name of Ouisconsin or Huron. This territory was originally owned and occupied by emigrants from France, consequently the old inhabitants or first settlers are mostly French.

The emigrants to the territory are mostly enterprising industrious farmers, who, from not being allowed to purchase the land on credit, thereby become immediately the real owners of the soil, and, being free from debt, bid fair to become wealthy citizens. They are mostly from the western part of New York, though many are from the New England states. Every state contributes more or less, and Ohio, for the last two years, not a few. The price of unsold wild land is fixed and uniform, being D.1. 25 [5s. 7½d. sterling] per acre; the terms ready money, and the title indisputable, as it comes direct from the United States, under the seal of the president. The richest, most fertile, and perhaps more beautiful part of the territory, is generally thought to be adjacent to the St Joseph's river and its various branches, which, from present appearances, bids fair to become speedily settled; settlements began to form on it a year before it was offered for sale. It only came in market last May, and such has been the influx of emigration to this part of the territory, that the legislature, in October last following, formed twelve new counties, mostly thereon, and organized two of that number. This part of the territory possesses several copious mill-streams, particularly Hog Creek, the Dowagiake, Christianna, Pigeon, Crooked and Portage rivers, a few of which have already been improved, by the erection of saw and grist-mills. The climate of this part of the territory, though mild, is apparently more subject to wind than the valley of the Ohio river. The prevailing wind is the south-west, and as it crosses a large tract of prairie country in Illinois and Indiana, comes here with much force, and in winter is somewhat piercing. Considerable snow falls, nevertheless it is very favourable to wheat, rye, potatoes, and turnips; and though not very adverse, yet not so congenial as the valley of the Ohio river to southern corn, and the more tender grains and esculents. Fruits, of course, have not yet been cultivated here, except a few apples and peaches, by the French, which appear to do well.

Grand River empties into the east side of Lake Michigan, about 245 miles south-westerly from Michillimackinac, and 75 north of the St Joseph's, and is between 50 and 60 rods wide at its mouth, and of sufficient depth to admit vessels drawing eight feet water. On its south bank, near its entrance into the lake, is an eligible situation for a town, the land being excellent, and gently inclining towards the north and west, giving at the same time a fine view both of the river and lake; but the opposite shore at the same place has a sandy sterile appearance.

For about 60 miles up the river on the north side, the Ottawas hold possession. There are between 800 and 900 of these people living along Grand River and its tributaries, but many of their most populous villages are on lands belonging to the United States.

This river is the largest stream that waters the west part of the peninsula of Michigan, being 270 miles in length, its windings included, and navigable 240 miles for batteaux; receiving in its course a great number of tributary streams, among which are Portage, Red-Cedar, Looking-glass, Soft-Maple, Muscota, Flat, Rouge, and Thorn-Apple rivers.

Portage river, which has its course through a chain of low marshy prairies, is a deep muddy stream about 15 yards wide at its mouth. Its branches interlock with those of the Huron of Lake Erie, and the Indians pass from the former into the latter with the canoes, by crossing a portage of one mile and a half. It is probable, that, at no distant period, a canal will be constructed near the route of these two rivers, so as to afford a safe and easy inland communication between Lakes Erie and Michigan. The distance from Detroit to the mouth of Grand River, by way of Michillimackinac, is 560 miles. This route in the spring and fall is attended with much uncertainty; and, in case of a war with the English, the navigation of the Straits of Detroit and St Clair would be rendered doubly dangerous. These difficulties would be obviated by a communication by water through the interior. The land at the Portage rises 40 or 50 feet above the level of the streams on each side; but a level prairie, two or three miles to the west of that place, is said to extend from one river to the other."

LONGEVITY OF ACTORS.

Actors, we mean good actors, and respectable men, are a long-lived race. A friend has remarked that he could recollect thirty actors, generally of high eminence, who died, within the space of forty years, at or beyond the age of seventy; and adds, "it would be difficult to show as large a number out of the same proportion of merchants or traders." Macklin died more than 100 years of age; we saw him act, with power and spirit, his Shylock, and Sir Pertinax, at the age of 94; Mrs Bracegirdle died at 85; Mr Yates, 97; Mr Blisset the elder, 84; Colley Cibber, 86; and a very long list of names might be added of those who lived beyond the "threescore and ten" allotted to men in general who live to old age. There are now, or lately were living, in competence or affluence, many more who could be mentioned as proofs of longevity among actors. The improvidence of actors is another vulgar error. When we speak of actors, we do not mean message carriers, or the candle snuffers and dram-drinkers of the stage. Of the hundreds who have retired from the stage in affluence, or with competencies, or now live and act with the same advantage, we will only mention the names of Quin, Yates, Garrick, Smith, Cibber, Farren, Siddons, Matthews, Darley, Jefferson, Wood, Hull, Mattocks, Melmoth, Barry, Clive, Pritchard, Johnson, O'Neil, Bartley, Pope, Quick, Dodd, Bannister. We could fill our page with names who are honoured for their talents, and enjoy in private life the more estimable reward of esteem for their virtues. It is the lot of the historian of the stage to record vice and folly, and that record is remembered longer than the page which speaks of virtue; so the pages of the historian are filled with war and crime, and the years of peace passed over. Men's good deeds are written in sand—their evil ones on brass.—*From Dunlap's Anecdotes of the American Theatre.*

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, John Macleod, 20, Argyle Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 84. SATURDAY, SEPTEMBER 7, 1833. PRICE THREE HALFPENCE.

MAKERS AND SPENDERS.

(First Article.)

IT is apparent that an immense part of what is gained is not spent by those who gain it. Whether wages, salaries, stipends, or fees, the most of those who work for them enjoy but a small part themselves. All that a man gets in this world is a cup of tea and a roll in the morning, a slice of butcher-meat perhaps at dinner, and possibly another cup of tea, or some other slight affair, in the evening. Now and then, he gets a new coat. But this is all. The most of what he wins fills other mouths entirely. The money goes he hardly knows where. Some part, no doubt, feeds the creatures whom he has taken in bond from nature, and is obliged both by law and by his own feelings to support. But yet, making allowance for all that, and for taxes besides, which may be described as a drainage almost equally unavoidable—by far the most of what the most of people acquire by their own handiwork, is spent and enjoyed, not by themselves, but by others. You, ye sheep, says Virgil, grow wool not for yourselves; you, ye bees, make honey not for yourselves; you, ye oxen, draw ploughs not for yourselves. This is in a great measure the case with mankind too. A few of us are industrious to the excoriation of our fingers, and the dizzying of our heads; but, by reason of our very application, we have neither time nor taste to spend the result: it goes to provide senseless luxuries to persons who are some way or other connected with us, and who, relying more upon our resources than we are ourselves disposed to do, permit themselves to have abundance of both time and taste. Who do you think keep up the deep-heeled boots, and the handsome clothes, and the cigars that are smoked on our fashionable streets?—not, to be sure, the smockfaced fools who wear and whiff them. Who do you think support the fine fancy taverns, which, under the monkey names of cafés, and saloons, and divans, now ornament our cities?—not, to be sure, the strutting coxcombs who frequent these places, and think they are enjoying life. It almost all comes out of the pockets of industrious fathers, brothers, and other oppressed relations, who would be shocked at nothing so much as to be told that they supported such follies.

There might be some curious statistical inquiries in connection with this subject. In the first place, out of the whole population of the empire, how many work and support themselves, and how many are indolent, and trust to others? Then, taking a few random instances of men who can gain more than they themselves require, it would be worth while to inquire how much, upon an average, and in proportion to their circumstances, such persons do for the slothful, the vicious, and the really unfortunate, who, like limpets on the back of some noble fish, stick to them for habitation and sustenance. Some, it would be found, besides maintaining the members of their own immediate household, voluntarily or involuntarily support nearly as many more. The fact is, every man and woman in the empire, who is in tolerably good circumstances, or who by any kind of chance has the administration of funds, is burdened with a greater or lesser number of dependents, some of whom, perhaps, really possess a claim through relationship, while a host of others have hardly the least purchase upon them, but, with the usual tenacity of the needy, would cling for ages by the slightest tendril of adherence. Whether one be in funds or not, if he only keeps a house at all, and has a door-bell to be rung,* he is apt to experience the same calamity. Such occasional expenditure of one's substance would hardly be grudged, if it were not that every existing family has some awful vampire, some unconscionable monster, who, while all the rest are steady and well-doing, finds it impossible to do any thing but incur large debts, engagements, and forfeits; to liquidate which, and thus save him and themselves from shame, deprives industry, self-denial, and talent, of all their legitimate and hard-earned reward. If such monsters as these would be content to come in at meal-hours, and take their meat and drink, it would be all very well. The mere animal support of the wretches would be little felt. But they would take scorn to appear in this character at the table of either father, brother, or sister. Their pride and desire of showing off require that they should be put into some way of business, which, without of course exacting from them the least labour, or interfering in the least with their pleasures, may give them the management of considerable sums of money, and thus enable them to make an equal or even a better appearance than the very friends who have to supply the means. In a few years, it is found that they have been playing at the game of keeping shops, at an expense to those relations of several hundred pounds a-year, or it may be more, above what would have been requisite for the mere bed and board of the insatiables; and all that the really meritorious have made in that time is squandered by the foolish. Nor is this the end of the monster. No: worse than worthless as his existence is, he must still be kept in life; and it is not always that his gawky pride and mindless wilfulness will permit the cheapest way to be taken for effecting this. After the first stings of injury have been forgot, that common affection to which he trusts, once more revives, and he is again provided with the means of entering into a visionary business, and showing off as he was wont. The same result, of course, ensues. In short, this monster hangs like a leech upon the family, till all that it has made from youth to age, and perhaps its original patrimony besides, is fairly drained and dribbled off through the channel of his base debaucheries. Such is not certainly the general extent of the evil; but that it is always more or less so, every family in the country, above the condition of labourers, and beneath that of the aristocracy, will attest. It seems as constant in nature that every household should have its one or more *black sheep*, as that every nest should contain a bird smaller and feebler than the rest.

The condition of a *downdraught* is not confined to persons of this order: there are *Father downdraughts* also. Strange as it may appear, nothing can be more certain—and every one on recollection will acknowledge it is so—than that there are many, very many instances of fathers of families, who hardly ever did any thing all their lives for the maintenance of either wife or children. We once before remarked, that, though only a limited portion of persons in one generation are the fathers of the next, the support of the said rising generation is one way and another pretty well allocated over society. This is certainly true; but it generally happens that the wife and some of the children themselves are most immediately pressed with the burden. There are some men whose habits in their unmarried state might have assured any woman of their inability to win a woman's bread; yet, whether this were obvious or not, such men never fail somehow or other to get married. It is then soon proved; and almost from the marriage-day, the unfortunate woman—born perhaps to better prospects—perhaps hitherto unaccustomed to any kind of manual labour or exertion—is obliged to be herself the principal or sole bread-winner. Some men have the nature of Frenchmen in this respect. They think the woman well off in the mere honour of being married. They spend their own lives in amusement, or in idle sottishness, leaving to the wife every active duty, from the nursing of her children to the gaining of the family bread. We have known many a poor woman thus *trysted*, as the Scotch call it, and who declared, that, if her husband would only be perfectly negative, and do neither harm nor good—if he would only not interfere with her humble business, or affront her before her customers—she would rejoice in her toils, and would not even grudge to afford him a decent sum every week, which he might spend as he pleased. It generally happens, however, that the maudlin monster cannot be thus purchased off. No bribe will satisfy his horrid appetite; and, if refused what she either has not to give, or cannot give without breaking her little commercial engagements, he will burst in upon her at times when she would rather see a basilisk, and, by the very *blackguardism* which he *knows* there is in his appearance, and calculates upon as the means of degrading her in the eyes of the world, attempt to frighten her into the required sacrifices. All her modest industry, all her honourable endeavours to maintain a family which *he* should maintain, are often thus blasted, or at least greatly marred; nor while health and strength are vouchsafed to her destroyer, may she entertain any immediate hope of being relieved from him. Could a commission of assassination be sued out against such a wretch, the most benevolent man on earth might be delighted to draw the trigger; but unfortunately this is impossible. She must wait on and on, through years of toil and grief, till kind nature shall be pleased, of her own accord, to call off the bandog by whom she has been so long tormented, and at length permit her virtuous exertions to have their fair scope and their proper reward.

It often happens that the children have a large share in calamities of this kind. When the father becomes thus sunk in self-indulgence, thus lost to all self-respect, the exertions of the mother may perhaps hardly suffice. The consequence is, that their offspring are taken half-instructed, or not instructed at all, and placed at any kind of employment by which they may earn a pittance. No matter that their prospects in life are thus narrowed, or their bodily and moral health exposed to destruction; the momentary gratification of a selfish appetite would console a parent of this kind for any ill that could befall any of his fellow-creatures, however nearly connected with him. Many young people are, from this and other causes, burdened before their time with large encumbrances; and although the duty is generally one of love, the hardship remains the same on the one side, and the injustice on the other. There is just one consolation as an offset to this calamity: it generally causes the new generation to be as careful and industrious as the preceding was the reverse. Horror-struck at the conduct of their fathers, the young people aim just the more at a contrary kind of life, and they generally thrive accordingly. Sometimes, after a victim has trod the streets for years in all the habiliments of woe, a strange revival suddenly takes place in his appearance. All at once, he gets a hat that *has* a crown, shoes that really possess soles, and possibly a new second-hand green surtout. The cause of this is, that the eldest son has just begun to make somewhat more than apprentices' wages. After their children have got a little forward in the world, Messieurs the Victims sometimes brush up amazingly. They begin to talk of "my son John," and almost seem to think

* In Scotland, the most of houses have a door-bell only, which is used by all kinds and classes of visitors.

themselves once more respectable members of society. John, however, continues to be terribly tried for all that, and many is the shilling he has to disburse for their occasional potations, over and above all his expenses for food and clothes, and all the charges he is under on account of their endless string of small children. In fact, sons are often held to the grinding-stone for the better part of life by fathers of this kind; and so much have they to do for *his* family, so effectually are they thus frightened at the very idea of such a thing, that it is ten to one against their ever finding themselves in heart to marry. They are forty before the tenth brother is out of petticoats, and after that they very rationally conclude that they have had enough to do with children, for one life at least.

POPULAR INFORMATION ON SCIENCE.

COLOURS OF THE SUN, MOON, AND STARS—HALOS—CORONÆ.

THE sun and moon generally appear to us unaccompanied by any change of colour or attendant phenomena—the one pouring forth a flood of lustre too dazzling to be contemplated by the naked eye; the other, a tender and beamy radiance, which, in the language of a noble poet,

> Softens down the hoar austerity
> Of rugged desolation, and fills up
> As 'twere anew the gaps of centuries,
> Leaving that beautiful which still was so,
> And making that which was not.

So glorious an object as the sun could not fail to attract the admiration and veneration of mankind, even in the darkest ages; nor is it surprising that it should have been deified and worshipped as a visible god, a superstition which even the sternest Christian philosopher will be tempted to forgive. Ignorance is always the mother of superstition, nor can it ever be otherwise, whensoever human conviction resigns itself to the fallacious though fascinating light of imagination, instead of pursuing the sober and permanent principles of correct reasoning. Hence, whenever the sun or moon presented any peculiar or unusual appearance, the ancients readily construed such into signs of some approaching calamity: thus, we read in Plutarch, that when Nicias and his army were prepared to depart from Sicily, they refused to embark, because the moon had become eclipsed in the dead of night, which superstitious conduct proved fatal both to the heroic commander and to his brave companions, who, in consequence of this, were all slain or taken prisoners. The army of Alexander the Great, on one occasion, likewise became considerably discouraged by an eclipse of the moon; but that wily general brought forward some Egyptian soothsayers, who interpreted that the eclipse portended calamities only to the enemy, by which happy expedient they revived the drooping spirits of the men, who then readily commenced their march. Anecdotes such as these are highly interesting and instructive; and while they teach us to estimate the advantages which we have gained by the progress of science, they should inspire in us feelings of gratitude towards those highly-gifted philosophers who were the first to thread the mazy and intricate paths which conducted to those splendid discoveries that have since illumined and benefited the whole world. It was the illustrious Newton who was the first, as we have already stated, to demonstrate the laws which govern the reflection and refraction of light, and it was he who, with unprecedented ingenuity, succeeded in resolving it into its elementary constituents. He shewed that the light which illumines the whole face of nature is composed of different coloured rays, which, when combined together, produce the dazzling white effect. These rays, which are termed primary, or prismatic (from their having been discovered by means of a triangular piece of glass, called a prism), have been reduced to three in number, the red, the yellow, and the blue. It follows, then, that when the white light passes through a medium by which it is decomposed, these colours become apparent, and, by blending together, produce all the other beautiful colours which are displayed in the rainbow. According, then, as their light becomes resolved into these primary rays, the sun and the moon present a differently coloured disc. When their rays are transmitted to us through a dry fog—that is, a fog that does not affect the hygrometer, or instrument for measuring the quantity of moisture suspended in the air—they appear red; when, however, they pass through a moist fog, they appear white. Prognostications of change of weather have thence been deduced. Byron, in his Shipwreck, observes—

> "The sun rose red and fiery, a sure sign
> Of the continuance of the gale."

Virgil, also, who was as acute an observer as he was elegant a poet, thus also observes—"It will be more profitable to observe this also when the sun, having measured the heavens, is going down, for we often see various colours wander over his face. The blue foretells rain, the fiery wind; but if the spots begin to be mixed with fiery red, then you may expect a storm of wind and rain."

The colours of the stars, arising from similar causes, are also peculiarly interesting and beautiful. Hercules is a double star—the large star is red, the small one of a bluish-green colour; Aldebaran is of a glowing purple; Scorpio and Mars are red; Lyra is of a variable colour. The most remarkable phenomenon, however, is the variation of colour exhibited by some of the fixed stars. "I first observed this phenomenon (says Forster) in the September of 1809. In the twinkling of the star the colour changed, so that one twinkle or dilatation of the brightness of the star seemed whitish, and the next or alternate twinkling seemed red. I have attributed this appearance to some wavy motion in the upper part of our atmosphere, whereby being imperfectly prismatic, it produced different colours according to the relative inclination of the undulating surface."* Although the author hazards a conjecture that this change of colour might arise from some change in the star itself, yet the explanation just given is infinitely more probable and satisfactory. The different colours of the sky, the deep azure blue so admired in Italy and in tropical countries, and the pale cold greyish hue so much more frequently observed in "the cold north," the vivid and beautiful colours which at sunrise and sunset tinge the distant clouds and mountains, and village spires, are all attributable to the different degree of refrangibility possessed by each of these primary rays. "Had it been otherwise—had the objects of the material world (says Sir David Brewster) been illuminated with white light, all the particles of which possessed the same degree of refrangibility, and were equally acted upon by the bodies on which they fall, all nature would have shone with a leaden hue, and all the combinations of external objects, and all the features of the human countenance, would have exhibited no other variety than that which they possess in a pencil sketch or china-ink drawing. But he who has exhibited such matchless skill in the organization of material bodies, and such exquisite taste in the forms upon which they are modelled, has superadded that ethereal beauty which enhances their more permanent qualities, and presents them to us in the ever-varying colours of the spectrum."†

Besides the changes of colour referred to, which are occasionally observed in the sun and moon, these orbs of light are not unfrequently seen surrounded by luminous circles, the larger of which are termed HALOS, and the smaller CORONÆ.‡ They are called lunar or solar, according as they appear round the moon or sun; but it has been observed that the former are the most common. In general, they are complete circles: some have been observed, however, oval; but Dr Smith has shown that this is an optical deception, produced by the apparent figure of the sky. Occasionally they are seen tinted with all the colours of the rainbow. "On the 2d of November 1827 (says a contributor to Silliman's Journal), between the hours of seven and eight, there appeared around the moon (a little more than its width in diameter) a very luminous saffron-coloured light. On the outer edge was a circle of bright red, which was graduated into a dark purple; around the purple was a circle of bright blue, which faded into a yellowish green, increasing towards the outer edge to a very vivid green. There appeared to be faint white rays passing from the moon across these columns, whose circles formed around this lunar glory a larger circle of a dark leaden colour, which gave the whole a very beautiful appearance."§ In the higher northern latitudes such phenomena are of frequent occurrence. "During many nights (says Captain Parry) there was a halo round the moon, though the stars shone brightly, and the atmosphere appeared otherwise clear. The same phenomenon was observed round the candles even in our bed-rooms, the diameter of the halo increasing as the observer receded from the light. These halos, both round the moon and candles, occasionally exhibited prismatic light."¶ Very often more than one luminous circle is exhibited, but seldom more than two are observed at the same time. Triple halos have, however, been seen;—thus, Sir Isaac Newton observed by reflection in a vessel of standing water, three rings of colour round the sun, like three little rainbows. Solar halos occur often, but, from the transcendant brightness of that luminary, are frequently unnoticed. On the 8th of September 1816, at Newport, Rhode Island, a halo of the ordinary size was seen to surround the sun, which remained visible nearly an hour, and exhibited all the colours of the rainbow. On the 9th of April 1820, a remarkable one appeared to Captain Parry:—"It consisted of one complete halo, and segments of several other halos, some of which were not unlike parts of rainbows resting on the horizon." This beautiful phenomenon, attended with other remarkable appearances which he has accurately described, lasted from noon until six o'clock in the evening. But attending the appearance of these halos, there remain to be noticed two phenomena which are not less interesting and remarkable; the one, the PARHELION, or mock sun; the other, the PARASELENA, or mock moon—a description of which will be found in next number of the Journal.

TALE OF GRIZEL COCHRANE.

THE age which this noble woman adorned with her life and heroic actions, was that gloomy one extending between the Restoration and Revolution (from 1660 to 1688), when the Scottish nation suffered under a cruel oppression, on account of their conscientious scruples respecting the existing forms of church and state. Three insurrections, more bold than wise, marked the impatience of the Scotch under this bloody rule; but it was with the last solely that Grizel Cochrane was connected.

Sir John Cochrane of Ochiltree, the father of our heroine, was the second son of the first Earl of Dundonald, and the ancestor of the present line of that noble and ingenious family. He was a distinguished friend of Sidney, Russel, and other illustrious men, who signalised themselves in England by their opposition to the court; and he had so long endeavoured in vain to procure some improvement in the national affairs, that he at length began to despair of his country altogether, and formed the design of emigrating to America. Having gone to London in 1683, with a view to a colonising expedition to South Carolina, he became involved in the deliberations of the Whig party, which at that time tended towards a general insurrection in England and Scotland, for the purpose of forcing an alteration of the royal councils, and the exclusion of the Duke of York from the throne. In furtherance of this plan, Sir John pledged himself to assist the Earl of Argyle in raising the malcontents in Scotland. This earl was, if not the acknowledged head of the party in that kingdom, at least the man of highest rank who espoused its interests.

By the treachery of some of the subordinate agents, this design was detected prematurely; and while some were unfortunately taken and executed, among whom were Sidney and Lord Russell, the rest fled from the kingdom. Of the latter number were the Earl of Argyle, Sir John Cochrane, and Sir Patrick Hume of Polwarth—the last a patriot rivalling Cochrane in talent and purity of motives, and also, like him, destined to experience the devotedness of a daughter's love. The fugitives found safety in Holland, where they remained in peace till the death of Charles the Second, in February 1685, when the Duke of York, the object politically of their greatest detestation, became king. It was then determined to invade Scotland with a small force, to embody the Highland adherents of Argyle with the west country Presbyterians, and, marching into England, to raise the people as they moved along, and not rest till they had produced the desired melioration of the state. The expedition sailed in May; but the government was enabled to take such precautions as, from the very first, proved a complete frustration to their designs. Argyle lingered timidly in his own country, and, finally, against the advice of Cochrane and Hume, who were his chief officers, made some unfortunate movements, which ended in the entire dissolution of his army, and his own capture and death. While this well-meaning but weak nobleman committed himself to a low disguise, in the vain hope of effecting his escape, Sir John Cochrane and Sir Patrick Hume headed a body of 200 men, formed out of the relics of the army, and bravely resolved, even with that small force, to attempt the accomplishment of their original intention—namely, a march into England. They accordingly crossed the Clyde into Renfrewshire, where they calculated on obtaining some reinforcement. The boats on this occasion being insufficient to transport the whole at once, the first party, headed by the two patriots, was obliged to contend, on the opposite bank of the river, with a large squadron of militia, while the boats returned for the remainder; after which the united force caused their opponents to retreat. The militia returned, however, in greater force, and renewed the assault at a place called Muirdykes, in the parish of Lochwinnoch. They were now commanded by Lord Ross and a Captain Clellan, and amounted to two troops, while Sir John Cochrane's men had decreased to seventy in number. In this predicament they were called on by the royal troops to lay down their arms, and surrender themselves prisoners. But, preferring the risk of death on the field to the tender mercies of a vindictive foe, they rejected the terms with disdain, and, entering a sheepfold, used its frail sod walls as a defence against the furious attack of the enemy, whom, after a keen conflict, in which every man fought hand to hand with his opponents, they at length succeeded in beating off, with the loss of their

captain and some other men, while Lord Ross was wounded. Cochrane, however, soon after learned that the enemy was returning with a great reinforcement, and fearing that he could not much longer defend himself on the field, retired with his troops to a neighbouring wilderness or morass, where he dismissed them, with the request that each man would provide the best way he could for his own safety. For himself, having received two severe contusions in the body during the engagement, and being worn out with fatigue, he sought refuge in the house of his uncle, Mr Gavin Cochrane of Craigmuir, who lived at no great distance from the place of encounter. This gentleman, however, as it unfortunately happened, had married a sister of the Captain Clellan killed in the late battle, and, filled with revenge for the death of her brother, this lady secretly informed against her guest, who was immediately seized and removed to Edinburgh, where, after being paraded through the streets bound and bare-headed, and conducted by the common hangman, he was lodged in the tolbooth on the 3d of July 1685, there to await his trial as a traitor. The day of trial came, and he was condemned to death, in spite of the most strenuous exertions of his aged father, the Earl of Dundonald, who, having received his title from the hands of Charles the Second, had, from motives of honour, never conspired against him.

Where is the tongue that can express all the secret and varied anguish that penetrates the yearning heart, when about to leave for ever the warm precincts of mortality, to quit the loving charities of life, and to have all the cords which bound it to existence suddenly torn asunder? Natural strength of mind may suffice to conceal much of this mortal conflict, or even to hide it altogether from the eye of the careless observer, but still it is at work within, and grapples in deadly struggle with the spirit.

Such was the state of Sir John Cochrane's mind on the night of his condemnation, when left once more to the gloomy solitude of his prison. It was not the parting stroke of death he feared, however sharp. He was a father, loving and beloved; and the thoughts of the sorrow his children were doomed to suffer on his account, wrung his heart, and burning tears, which his own fate could not have called forth, were shed for them. No friend or relative had been permitted to see him from the time of his apprehension; but it was now signified to him, that any of his family he desired to communicate with might be allowed to visit him. Anxious, however, to deprive his enemies of an opportunity of an accusation against his sons, he immediately conveyed to them his earnest entreaties, and indeed commands, that they should refrain from availing themselves of this leave till the night before his execution. This was a sacrifice which it required his utmost fortitude to make; and it had left him to a sense of the most desolate loneliness, in so much, that, when, late in the evening, he heard his prison door unlocked, he lifted not his eyes toward it, imagining that the person who entered could only be the jailor, who was particularly repulsive in his countenance and manner. What, then, was his surprise and momentary delight, when he beheld before him his only daughter, and felt her arms entwining his neck! Yet, when he looked on her face, and saw the expression it bore of mute despairing agony, more fearful than the most frantic manifestations of misery, and marked her pale cheeks, which no longer bloomed with the tints of health and happiness, and felt the cold dampness of her brow, he thought himself wrong for having given way for an instant to the joy her presence had created, and every other sensation fled before his fear of what might be the consequence to her of this interview. He had no sooner, however, expressed his feelings on this subject, than she became sensible, that, in order to palliate his misery, she must put a strong curb upon her own, and in a short time was calm enough to enter into conversation with her father upon the dismal subject of his present situation, and to deliver a message from the old earl, her grandfather, by which he was informed that an appeal had been made from him to the king, and means taken to propitiate Father Peters, his majesty's confessor, who, it was well known, often dictated to him in matters of state. It appeared evident, however, by the turn which their discourse presently took, that neither father nor daughter were at all sanguine in their hopes from this negociation. The Earl of Argyle had been executed but a few days before, as had also several of his principal adherents, though men of less consequence than Sir John Cochrane; and it was therefore improbable that he, who had been so conspicuously active in the insurrection, should be allowed to escape the punishment which his enemies had it now in their power to inflict. Besides all this, the treaty to be entered into with Father Peters would require some time to adjust, and meanwhile the arrival of the warrant for execution must every day be looked for.

Under these circumstances, several days passed, each of which found Miss Grizel Cochrane an inmate of her father's prison for as many hours as she was permitted. During these interviews of the father and daughter, while heart clung unto heart, they reaped all the consolation which an undisguised knowledge of the piety and courage of each could bestow. Still, after such intercourse, the parting scene which they anticipated seemed more and more dreadful to think of; and, as the daughter looked on the pale and dejected countenance of her parent, her bosom was penetrated with the sharpest pangs. The love of her father might be termed a component part of her nature. She had cherished this filial love ever since she possessed a consciousness of thought, and it was now strong and absorbing, in proportion to the danger in which he stood. Grizel Cochrane was only at that period eighteen years old; but it is the effect of such perilous times as those in which she lived, to sober the reckless spirit of youth, and make men and women of children. She had, however, a natural strength of character, that would, on all extraordinary occasions, have displayed itself without such a tuition, and which, being now joined with what she conceived the necessity of the case, rendered her capable of a deed which has caused her history to vie with that of the most distinguished of heroines.

Ever since her father's condemnation, her daily and nightly thoughts had dwelt on the fear of her grandfather's communication with the king's confessor being rendered unavailable, for want of the time necessary for enabling the friends in London, to whom it was trusted, to make their application, and she boldly determined to execute a plan, whereby the arrival of the death-warrant would be retarded. A short time, therefore, before it was expected by the council in Edinburgh, she thought it necessary, in her visit to her father, to mention that some urgent affair would prevent her from seeing him again for a few days. Alarmed at this, and penetrating her design of effecting somewhat in his favour, he warned her against attempting impossibilities.

"Nothing is impossible to a determined mind," said she, "and fear nothing for me."

"But the inexperience of youth, my child," he replied, "may involve you in danger and in blame; and did you but know the characters of those you must encounter, while vainly pleading for your father's life, you would fear, as I do, the sullying of your fair fame."

"I am a Cochrane, my father," said the heroic girl—an answer how brief, but to him how expressive! He could say no more: he beheld in his child, so young, so beautiful, and so self-devoted, all the virtues of her race combined, and he felt for the moment that the courage she had prayed for would be granted, to carry her through the undertaking she meditated, whatever that might be. She felt grateful to her father that he did not urge her further; but she trembled as she turned, at her departure, to catch another look of those loved and venerated features, for his eye appeared to be following her with a parting expression, which seemed to say it was the last fond look.

At that time horses were used as a mode of conveyance so much more than carriages, that almost every gentlewoman had her own steed, and Miss Cochrane, being a skilful rider, was possessed of a well-managed palfrey, on whose speed and other good qualities she had been accustomed to depend. On the morning after she had bid her father farewell, long ere the inhabitants of Edinburgh were astir, she found herself many miles on the road to the borders. She had taken care to attire herself in a manner which corresponded with the design of passing herself off for a young serving-woman journeying on a borrowed horse to the house of her mother in a distant part of the country; and by only resting at solitary cottages, where she generally found the family out at work, save perhaps an old woman or some children, she had the good fortune, on the second day after leaving Edinburgh, to reach in safety the abode of her old nurse, who lived on the English side of the Tweed, four miles beyond the town of Berwick. In this woman she knew she could place implicit confidence, and to her, therefore, revealed her secret. She had resolved, she said, to make an attempt to save her father's life, by stopping the postman, an equestrian like herself, and forcing him to deliver up his bags, in which she expected to find the fatal warrant. Singular as such a determination may appear in a delicate young woman, especially if we consider that she was aware of the arms always carried by the man to whose charge the mail was committed, it is nevertheless an undoubted fact that such was her resolve. In pursuance of this design, she had brought with her a brace of small pistols, together with a horseman's cloak, tied up in a bundle, and hung on the crutch of her saddle; and now borrowed from her nurse the attire of her foster-brother, which, as he was a slight-made lad, fitted her reasonably well.

At that period, all those appliances which at this day accelerate the progress of the traveller were unknown, and the mail from London, which now arrives in forty-two hours, took eight days in reaching the Scottish capital. Miss Cochrane thus calculated on a delay of sixteen or seventeen days in the execution of her father's sentence—a space of time which she deemed amply sufficient to give a fair trial to the treaty set on foot for his liberation. She had, by means which it is unnecessary here to detail, possessed herself of the most minute information with regard to the places at which the postmen rested on their journey, one of which was a small public-house, kept by a widow woman, on the outskirts of the little town of Belford. There the man who received the bag at Durham was accustomed to arrive about six o'clock in the morning, and take a few hours' repose before proceeding farther on his journey.* In pursuance of the plan laid down by Miss Cochrane, she arrived at this inn about an hour after the man had composed himself to sleep, in the hope of being able, by the exercise of her wit and dexterity, to ease him of his charge.

Having put her horse into the stable, which was a duty that devolved on the guests at this little change-house, from its mistress having no ostler, she entered the only apartment which the house afforded, and demanded some refreshment. "Sit down at the end of that table," said the old woman, "for the best I have to give you is there already; and be pleased, my bonny man, to make as little noise as ye can, for there's ane asleep in that bed that I like ill to disturb." Miss Cochrane promised fairly; and after attempting to eat some of the viands, which were the remains of the sleeping man's meal, she asked for some cold water. "What," said the old dame, as she handed it to her, "ye are a water-drinker, are ye? It's but an ill custom for a change-house." "I am aware of that," replied her guest, "and, therefore, when in a public house, always pay for it the price of the stronger potation, which I cannot take." "Indeed—well that is but just," responded the dame, "and I think the more of you for such reasonable conduct." "Is the well where you get this water near at hand?" said the young lady; "for if you will take the trouble to bring me some from it, as this is rather warm, it shall be considered in the lawing." "It is a good bit off," said the woman; "but I cannot refuse to fetch some for such a civil discreet lad, and will be as quick as I can. But, for any sake, take care and don't meddle with these pistols," she continued, pointing to a pair of pistols on the table, "for they are loaded, and I am always terrified for them." Saying this, she disappeared; and Miss Cochrane, who would have contrived some other errand for her had the well been near, no sooner saw the door shut, than she passed, with trembling eagerness, and a cautious but rapid step, across the floor, to the place where the man lay soundly sleeping in one of those close wooden bedsteads common in the houses of the poor, the door of which was left half open to admit the air, and which she opened still wider, in the hope of seeing the mail-bag, and being able to seize upon it. But what was her dismay when she beheld only a part of the integument which contained what she would have sacrificed her life a thousand times to obtain, just peeping out from below the shaggy head and brawny shoulders of its keeper, who lay in such a position upon it as to give not the smallest hope of its extraction without his being aroused from his nap. A few bitter moments of observation served to convince her, that, if she obtained possession of this treasure, it must be in some other way; and, again closing the door of the bed, she approached the pistols, and having taken them one by one from the holsters, she as quickly as possible drew out their loading, which, having secreted, she returned them to their cases, and resumed her seat at the foot of the table. Here she had barely time to recover from the agitation into which the fear of the man's awaking during her recent occupation had thrown her, when the old woman returned with the water, and having taken a draught, of which she stood much in need, she settled her account much to her landlady's content, by paying for the water the price of a pot of beer. Having then carelessly asked and ascertained how much longer the other guest was likely to continue his sleep, she left the house, and, mounting her horse, set off at a trot, in a different direction from that in which she had arrived. Fetching a compass of two or three miles, she once more fell into the high road between Belford and Berwick, where she walked her horse gently on, awaiting the coming up of the postman. Though all her faculties were now absorbed in one aim, and the thought of her father's deliverance still reigned supreme in her mind, she could not help occasionally figuring to herself the possibility of her tampering with the pistols being discovered, and their loading replaced, in which case it was more than likely that her life would be the forfeit of the act she meditated. A woman's fears would still intrude, notwithstanding all her heroism, and the glorious issue which promised to attend the success of her enterprise. When she at length saw and heard the postman advancing behind her, the strong necessity of the case gave her renewed courage; and it was with perfect coolness, that, on his coming close up, she civilly saluted him, put her horse into the same pace with his, and rode on for some way in his company. He was a strong thick-set fellow, with a good-humoured countenance, which did not seem to Miss Cochrane, as she looked anxiously upon it, to savour much of hardy daring. He rode with the mail-bags strapped firmly to his saddle in front, close to the holsters (for there were two), one containing the letters direct from London, and the other those taken up at the different post-offices on the road. After riding a short distance together, Miss Cochrane deemed it time, as they were nearly half-way between Belford and Berwick, to commence her operations. She therefore rode nearly close to her companion, and said, in a tone of determination, "Friend, I have taken a fancy for those mail-bags of yours, and I must have them; therefore, take my advice, and deliver them up quietly, for I am

* Lest it should appear at issue with probability that the postman should thus take his ease in his inn, it may be mentioned, as a fact defying all question, that this official, at a period much later, used sometimes to dismount on a muir, near the place here mentioned, and partake in a game at quoits, or other sports which might be proceeding by the wayside.

provided for all hazards. I am mounted, as you see, on a fleet steed; I carry fire-arms; and, moreover, am allied with those who are stronger, though not bolder than myself. You see yonder wood," she continued, pointing to one at the distance of about a mile, with an accent and air which was meant to carry intimidation with it. "Again, I say, take my advice; give me the bags, and speed back the road you came for the present, nor dare to approach that wood for at least two or three hours to come."

There was in such language from a stripling something so surprising, that the man looked on Miss Cochrane for an instant in silent and unfeigned amazement. "If," said he, as soon as he found his tongue, "you mean, my young master, to make yourself merry at my expense, you are welcome. I am no sour churl to take offence at the idle words of a foolish boy. But if," he said, taking one of his pistols from the holster, and turning its muzzle toward her, "ye are mad enough to harbour one serious thought of such a matter, I am ready for you. But, methinks, my lad, you seem at an age when robbing a garden or an old woman's fruit-stall would befit you better, if you must turn thief, than taking his majesty's mails from a stout man such as I am upon his highway. Be thankful, however, that you have met with one who will not shed blood if he can help it, and sheer off before you provoke me to fire."

"Nay," said his young antagonist, "I am not fonder of bloodshed than you are; but if you will not be persuaded, what can I do? for I have told you a truth, *that mail I must and will have.* So now choose," she continued, as she drew one of the small pistols from under her cloak, and deliberately cocking it, presented it in his face.

"Nay, then, your blood be on your own head," said the fellow, as he raised his hand, and fired his pistol, which, however, only flashed in the pan. Dashing this weapon to the ground, he lost not a moment in pulling out the other, which he also aimed at his assailant, and fired with the same result. In a transport of rage and disappointment, the man sprung from his horse, and made an attempt to seize her; but, by an adroit use of her spurs, she eluded his grasp, and placed herself out of his reach. Meanwhile, his horse had moved forward some yards, and to see and seize the advantage presented by this circumstance was one and the same to the heroic girl, who, darting toward it, caught the bridle, and having led her prize off about a hundred yards, stopped while she called to the thunderstruck postman to remind him of her advice about the wood. She then put both horses to their speed, and on turning to look at the man she had robbed, had the pleasure of perceiving that her mysterious threat had taken effect, and he was now pursuing his way back to Belford.

Miss Cochrane speedily entered the wood to which she had alluded, and tying the strange horse to a tree, out of all observation from the road, proceeded to unfasten the straps of the mail. By means of a sharp penknife, which set at defiance the appended locks, she was soon mistress of the contents, and with an eager hand broke open the government dispatches, which were unerringly pointed out to her by their address to the council in Edinburgh, and their imposing weight and broad seals of office. Here she found not only the fatal warrant for her father's death, but also many other sentences inflicting different degrees of punishment on various delinquents. These, however, it may readily be supposed, she did not then stop to examine: she contented herself with tearing them into small fragments, and placing them carefully in her bosom.

The intrepid girl now mounted her steed, and rode off, leaving all the private papers where she had found them, imagining (what eventually proved the case) that they would be discovered ere long from the hints she had thrown out about the wood, and thus reach their proper places of destination. She now made all haste to reach the cottage of her nurse, where, having not only committed to the flames the fragments of the dreaded warrant, but also the other obnoxious papers, she quickly resumed her female garments, and was again, after this manly and daring action, the simple and unassuming Miss Grizel Cochrane. Leaving the cloak and pistols behind her, to be concealed by her nurse, she again mounted her horse, and directed her flight towards Edinburgh, and, by avoiding as much as possible the high road, and resting at sequestered cottages, as she had done before, and that only twice for a couple of hours each time, she reached town early in the morning of the next day.

It must now suffice to say, that the time gained by the heroic act related above, was productive of the end for which it was undertaken, and that Sir John Cochrane was pardoned, at the instigation of the king's favourite counsellor, who interceded for him in consequence of receiving a bribe of five thousand pounds from the Earl of Dundonald. Of the feelings which on this occasion filled the heart of his courageous and devoted daughter, we cannot speak in adequate terms; and it is perhaps best, at any rate, to leave them to the imagination of the reader. The state of the times was not such for several years as to make it prudent that her adventure should be publicly known; but after the Revolution, when the country was at length relieved from persecution and danger, and every man was at liberty to speak of the trials he had undergone, and the expedients by which he had mastered them, her heroism was neither unknown nor unapproved. Miss Cochrane afterwards married Mr Ker of Morriston, in the county of Berwick; and there can be little doubt that she proved equally affectionate and amiable as a wife, as she had already been dutiful and devoted as a daughter.

THE ISLAND OF SKYE.

Skye, one of the Hebrides, or Western Isles of Scotland, is one of the most interesting islands lying on the shores of Britain, and may deservedly attract the notice not only of those who pry into the arcana of science, but also such tourists as delight to revel in the contemplation of nature's rudest and most romantic scenery. Skye presents to the eye of the stranger a variety of most magnificent points of original beauty. Its lofty hills of rugged outline, covered in part with blooming heath, or exhibiting bare rocky outlines, display in their formation a grandeur of scenery seldom paralleled. No place, perhaps, affords a greater number of picturesque subjects for the painter than Skye. In every quarter he meets with such prodigality of natural wonders, that he must feel bewildered, and at a loss to make a choice; for the landscape changes at almost every step, like the shifting of artificial scenery, and each successive view seems to excel the rest. Let us first give a few statistical facts regarding the island, and then introduce the stranger to some of the natural wonders of the place:—

Skye, whose name is of Scandinavian origin, and signifies "mist," or the "misty island," is the largest of the Western Isles, with the exception of Lewis, and belongs to the county of Inverness. In its situation it lies close in upon the mainland of the west coast, and can be reached by roads and ferries from different parts of the West Highlands. In length it measures forty-five miles, by a mean breadth of fifteen, but it is so indented by lochs or arms of the sea as to have less superficial area than those dimensions would give. There is scarcely, indeed, a point in it that is five miles from the shore in some quarter or other. By the indentation of the sea, it possesses a number of peninsulated tracts; that on the south, nearest the mainland, is the largest, and is called Sleat. From Strathaird, all the way round by the west to Portree, it is, with a few exceptions in the lochs, a continued range of cliffs, often rising to three, four, or even to six hundred feet; in a few cases even exceeding this height. The remainder of the coast is rarely very high, but it is every where rocky and romantic in its appearance. In recent times, the interior has been greatly improved by good roads, and this opening up of the country has produced wonderful advances in the operations of the farmer. A great proportion of the population still subsist by maritime pursuits; and there are few houses more than a quarter of a mile from the sea; wherefore, on a superficial view, the country has a deserted look, although it possesses a population of above 20,000. Of the only four proprietors of the island, Lord Macdonald owns nearly three-fourths of the land; and with the exception of Strathaird, belonging to Macalister, and an estate belonging to Raasay, the remainder is the property of Macleod. It is mentioned that the late Lord Macdonald expended no less than L.100,000 in the improvement of the island. The grain raised in Skye in good years is estimated at 10,000 bolls. The live stock is reckoned to be 4000 horses, of a small but hardy breed, and 18,000 head of cattle of excellent breed, of which about 3800 are exported annually to the low countries, from whence they are mostly sent southwards to fatten in the English pastures. The sheep are estimated at about 40,000, consisting chiefly of Cheviots and black-faced Lintons. Hogs, goats, and rabbits, abound, and game of all kinds is plentiful. Skye is divided into seven parishes, which, with the parish of Small Isles, form the presbytery of Skye. The principal towns and villages are Portree—the capital, on the north-east coast—Stein, Broadford, and Kyle-Haken. At the latter place there is now an admirable ferry, which conducts the Inverness road by Loch Alsh to Skye. The air of life given by the ferry-houses at this point, and by the boats and other vessels perpetually navigating the strait, adds much to the natural beauty of the scenery.

The most conspicuous of the central mountains of Skye rise to the height of two thousand and three thousand feet. The forms of these lofty eminences are in general conical, or rounded, and this peculiarity of shape arises from the same cause as their cheerless and desolate aspect; the mouldering rocks of the summit descending along their sides in streams, and often covering the whole declivities with one continuous coat of stones or gravel. Another group, ranging to two thousand feet in height, varied by ravines and precipices, covered with scattered woods, and of a very picturesque character, occupies the division nearest the mainland. But the highest group, as well as the most rugged, is that to the south, including the Cuchullin Hills, and Blaven, distinguished from the preceding by its dark, leaden, and strong colour—a hue which it retains even in sunshine and clear sky. The ridge from Portree northward is also mountainous, but it does not produce the same effect, on account of its nearly unbroken continuity. The district north from Portree is a perfect storehouse of geology. A huge mountain ridge in this quarter, called the Storr, is remarkable for its romantic and strange formation. Towards the east, it presents a range of lofty inland cliffs, broken into irregular shapes, and many hundred feet in height. While the faces of these are marked by projections and recesses, the outline of the sky is equally irregular and picturesque. Often when the clouds sail along and rest on the high point of the Storr, the forms of walls, turrets, and spires, may be seen emerging from the driving mists. The whole of these cliffs produce abundant and brilliant specimens of minerals highly esteemed by mineralogists. The cliffs are frequently columnar, and often extend in long ranges for many miles, with an air of architectural regularity as perfect in its general effect, if not actually as complete in the details, as the columns of Staffa. A cascade which falls over these cliffs forms an interesting spectacle in the midst of the rugged scene. The stream which produces it is projected from the top of a columnar cliff in a single spout, and falls, in a sheer descent of three hundred feet, into the sea. As it foams and boils in the waters of the ocean below, a boat can pass behind it, and permit the tourist, untouched, to admire the noise and fury of the torrent. The striking grandeur of the Storr, in some of its points, is hardly equalled in effect by any of the usually visited picturesque scenery of the Highlands of Scotland.

Skye possesses other scenes well worthy of the attention of visitors Not to mention the beautiful fresh-water lake, Loch-cor-uisge (the Lake of the Watery Glen), with its pretty little islands, there is a remarkable formation of nature, called Quiraing, consisting of a perfectly secluded piece of level and fertile ground, situated among some almost inaccessible mountain scenery, in the parish of Kilmuir, about twenty miles distant from Portree. The hill in which it is situated is about a thousand feet high, and slopes by a steep declivity to the west; but towards the north-east it presents a face of rugged precipices, much variegated by being here and there composed of huge basaltic columns, or massy fragments of fluted rocks. In other parts, large spaces, formed into concave sections, present themselves to the view, and have a grand appearance, from being ribbed transversely either by small fissures or protuberant seams, over which a little rivulet drizzles in the moist seasons of the year. This place is considerably elevated, and is, in consequence, viewed from the district below as one extended face of rock, interspersed by a variety of shades, according to the consistency or colour of the materials which compose it. In the face of this rock, then, Quiraing is enshrined, and hidden from the view of the visitor. He may be told that it is there, but without a guide he might fail for a length of time to discover it. This curiosity consists of a green plot of ground, formed into an oblong platform, of sufficient extent to contain six or seven regiments of soldiers. This interesting spot is studded all round with massive fragments of rock, formed into lofty peaks by the intervention of deep chasms, which are for the most part inaccessible. The rough path which leads from the road to the huge opening, which forms an entrance to Quiraing, is upon the whole pleasant, as it conducts the traveller along the base of a perpendicular rock, intersected in various places by dark hollow fissures. But on approaching the great inlet to the eagerly looked for platform, the passage is very much obtruded by heaps of stone and rubbish, which have been washed down from the crevices by the gradual waste of successive ages. By a little exertion, these obstacles may be overcome, and the visitor finds himself at the entrance of a steep passage, which would seem to lead him to the top of the hill. To the right of this entrance stands an isolated pyramid of rock, called "the Needle." This peak is very high, and is raised upon a circular base of very inconsiderable dimensions. After pausing and admiring every thing around him, the visitor then attempts to climb the great inlet which lies before him. Great caution must be taken should more than one individual climb this entrance at once; if so, it is necessary that they go abreast, for if the one go before the other, the small stones which will unavoidably tumble down, might very severely injure, by means of their accelerated velocity, the persons left behind. By considerable exertion, the tourist gains the top of the pass, and beholds with astonishment the scene which opens to his view. Instead of seeing, as he would expect, some narrow cave, or confined angular termination of the passage, formed from the apparent coalition of the impending rocks, he sees, with no less surprise than a pleasing disappointment, a spacious opening before him, in the middle of which stands the above-mentioned platform, a little elevated above the rest of the opening, but considerably lower than the top of the entrance, where the visitor yet stands. He now descends for some yards, and, by a small path, is led instantly to the beautiful green plain which was all along his object to attain. He is now at a loss what to examine first, or what to admire most. He beholds above him the top of the hill, which he saw from the plain below, little suspicious that such a fairy spot existed in the intervening space. The level sward which he now so much admires, possesses nothing attractive in itself, were it not for the place in which it is situated. The whole is encompassed by a bulwark of rocky pyramids, the bases of which are considerably lower in the inside than the platform; but on the out-

side these mighty columns slope down to a level with the mouth of the great entrance. These columns are seen to much advantage from the platform, as their summits are considerably elevated above the observer. The sea, and district below, can only be seen in detached fragments, through the ragged openings between the surrounding pyramids. The rocks which compose these huge columns are so streaked and variegated, and the columns themselves are so ragged and curiously formed, that the visitor's imagination delineates hundreds of grotesque figures, of the wildest description, on their surface. The nature of the day on which this interesting place is visited has a great effect upon its appearance. It is so studded and encompassed with columns, and pinnacles of all heights, sizes, and figures, that their flickering shadows, in a sunshine day, have an enchanting effect on all who behold them. Light and shade are then so uncommonly divided, and so constantly changing positions, that the place in consequence is greatly enhanced in beauty; but should a dense mist envelope the spot, as is frequently the case, the scene is greatly changed: instead of being lively and enchanting, the aspect of the place is mightily altered. The thick mist slowly floating through the pyramids, and intercepting their rugged pinnacles from the view, gives a sombre appearance to the whole. The visitor's imagination will lead him to think that the gloomy pyramids before him bind earth and heaven together. He cannot but admire, yet at the same time he is filled with a sort of awe, which causes him to ascribe the marvellous works which lie shrouded before him to the wonderful doings of that Omnipotent Being who created all things.

Want of space forbids us to expatiate farther on the extraordinary natural formations and romantic scenery of the "Misty Isle." We, however, take leave to recommend tourists in search of the picturesque, to make it a point in their journey through the Western Highlands. We can assure them they will find the inhabitants, among whom the progress of civilization has not yet banished the virtues characteristic of the primitive Celtic race, as kindly and well-disposed a class of people as exists in any of the British islands.

BIOGRAPHIC SKETCHES.

JOHN BUNYAN.

JOHN BUNYAN, the author of "The Pilgrim's Progress," was born in the year 1628, at Elstow, near Bedford.* His father was one of those mean workers in brass, commonly called *tinkers*, and it is not even unlikely that the family was of gipsy extraction. In early youth, he was put to school, and learnt to read and write, but soon forgot all that he had acquired. The circumstances of his family appear to have required that he should, at an early period of life, begin to assist his father in his business. From his earliest years, he had an enthusiastic and visionary turn of mind; and though his religious knowledge was perhaps very limited, it affected him in a very peculiar manner. His sleep was haunted with dreams of devils and wicked spirits, who endeavoured to take possession of him; and his waking moments, even in the midst of childish sports, presented him with reflections so nearly similar, that he often wished he had been a devil himself, and so have acted as the tormentor rather than the tormented. In his general conduct, he was a totally reckless young man, though exempted from drunkenness and other kinds of profligacy. In the eighteenth year of his age, he was a soldier in the parliamentary army, and was drawn out to go to the siege of Leicester: one of the same company having desired to go in his stead, Bunyan consented, and he ever accounted it a remarkable preservation, that the substitute was shot through the head, while acting as a centinel. About this time Bunyan married, and thus, perhaps, was preserved from many profligacies into which he might otherwise have fallen. The young pair were both very poor; not even so much as a dish or a spoon did they possess. He was able, however, to work for their bread, and his spouse happened to be a virtuous person. Two pious books, which came by her into his possession, were the first means of impressing him with serious thoughts; but their effect was slight and temporary. A sermon he heard one Sunday against Sabbath-breaking, affected him considerably; and that afternoon, while he was pursuing the sports then customary among the English peasantry on this sacred day, he heard, as he thought, a voice from heaven, expressing the displeasure with which his ungodly practices were regarded. The sobriety which this incident produced, was soon after exchanged for his usual recklessness of behaviour. He was one day swearing dreadfully on the streets of Bedford, when a woman of by no means good character, being shocked at his expressions, reproved him as the most abandoned wretch in the whole town—a rebuke that sunk so deep into his mind, as to cause him to give up profane speaking. Soon after, he began to read the Bible; and the neighbours began to observe with pleasure that his manners were undergoing improvement.

A very curious anecdote is told of Bunyan at this time, as illustrative of the state of his mind, which was that of a man affected by serious thoughts, but not yet able to give up altogether his early follies. He had taken great delight in bell-ringing, an exercise in which it is now difficult to see any harm, but which he began to think a vain and sinful practice, probably from its being connected with the externals of the established church. Still he so hankered after his old amusement, that, though he did not pull a rope himself, he would go and look at the ringers, not without a secret feeling that to do so was unbecoming the religious character which he now professed. A fear came upon him that one of the bells might fall: to secure himself against such an accident, he stood under a beam that lay athwart the steeple from side to side; but his apprehensions being once awakened, he then considered that the bell might fall with a swing, hit the wall first, rebound, and so strike him in its descent. Upon this he retired to the steeple door, thinking himself safe enough there; for if the bell should fall, he could slip out. Farther than the door he did not venture, nor did he long continue to think himself secure there; for the next fancy which possessed him was, that the steeple itself might fall; and this so much disturbed him, that he dared not stand at the door longer, but fled for fear the tower should come down upon him.* The last amusement from which he weaned himself was that of dancing; it was a full year before he could leave that: but in so doing, as on every other occasion when he thought he was performing his duty, he had such peace of mind, such satisfaction, that "I thought," says he, "no man in England could please God better than I."

Bunyan gradually acquired religious knowledge by means of study and conversation; and at length he became a member of a small Baptist congregation which had been established at Bedford by one John Gifford, a man who, after fighting for the king, and narrowly escaping a judicial death—after living the usual profligate life of the royalist soldiers—had become a pious and estimable person, and a preacher of the gospel to others. The subject of our memoir now began to be dreadfully afflicted with doubts as to his own merit in a religious point of view, and in particular was greatly puzzled to know whether he had faith or not. To solve this difficulty, he conceived the notion of trying to perform a miracle; accordingly, one day, being between Elstow and Bedford, he resolved to say to the puddles that were in the horse-pads, "Be dry," and to the dry places, "Be ye puddles!" Just, however, as he was about to do so, other thoughts came over him, and he determined to wait a little longer before attempting a miracle.

The first rudiments of the Pilgrim's Progress are found in a vision of his happier fellow-worshippers, which about this time was presented to his mind. "I saw," he says, "as if they were on the sunny side of some high mountain, there refreshing themselves with the pleasant beams of the sun, while I was shivering and shrinking in the cold, afflicted with frost, snow, and dark clouds. Methought, also, betwixt me and them, I saw a wall that did compass about this mountain. Now, through this wall my soul did greatly desire to pass; concluding, that if I could, I would even go into the very midst of them, and there also comfort myself with the heat of their sun. About this wall I thought myself to go again and again, still prying as I went, to see if I could find some way or passage by which I might enter therein; but none could I find for some time. At the last I saw, as it were, a narrow gap, like a little doorway in the wall, through which I attempted to pass. Now, the passage being very strait and narrow, I made many offers to get in, but all in vain, even until I was well nigh quite beat out by striving to get in. At last, with great striving, methought I at first did get in my head; and after that, by a sideling striving, my shoulders, and my whole body; then was I exceeding glad, went and sat down in the midst of them, and so was comforted with the light and heat of their sun."

Doubts, qualms, fears, returned upon him, notwithstanding the metaphorical assurance which this vision had conveyed to his mind. Whatever wild and wayward shadow streamed across the restless region of his thoughts, was arrested like a suspicious-looking person in a besieged city, brought to account for itself, and treated with an attention which the mere suggestion of casual fancy could hardly deserve. It is perhaps in this sense that the human heart is said in Scripture to be abominably wicked, since not only without our will, but in positive opposition to our best exertions, sinful suggestions profane the thoughts of the wisest, and foul emotions sully the heart of the most pure. The wise and well-informed shrink with horror from the phantoms of guilt which thus intrude themselves, and pray to heaven for strength to enable them to reject such pollution from their thoughts, and for power to fix their attention upon better objects. But the dark dread of his possible exclusion from the pale of the righteous rushed ever and anon with such vivid force on the mind of the unfortunate Bunyan, as to make him accept for fatal arguments against himself, the wildest and most transitory coinage of his own fancy, while, to fill up every pause, he was tortured by the equally terrible suspicion that he was guilty of the most unpardonable of crimes, as an habitual doubter of the efficacy of divine grace.*

In this wretched state, Bunyan convinced himself that his torments were the immediate infliction of the devil, and he suffered literally all the misery which he, to appearance, metaphorically describes as endured by Christian in the Valley of the Shadow of Death. He actually thought sometimes that he felt the enemy of mankind pulling him by the skirts, and desiring him to cease his prayers. Even in an age which the reader is aware produced the most wonderful variety of religious fervours, those of Bunyan are astonishing. After years of torture, his triumph was completed, when, one day, in the Baptist place of worship, he thought he heard these words three times repeated—"My grace is sufficient for thee." It was fortunate that he came through these dreadful states of feeling without a deranged understanding.

In 1655, on the death of Gifford, who is entitled to be considered as his "*Interpreter*," Bunyan was chosen with some others to minister to the congregation. It is to be mentioned in his favour that he undertook this task in no confident or intrusive spirit, but the reverse. It appears that a regular clergyman was soon after appointed, and Bunyan then confined himself to preaching in the surrounding villages, to those who were perfectly ignorant of religion. Amidst these duties, which were practised without interfering with his ordinary occupations, he found time to write his first work, which was an attack upon the peculiar tenets of the Quakers, then a new sect. He had previously scribbled verses on the margins of his copy of Fox's Martyrs, which is still preserved;† but they were the merest doggrel. In prose, however, when he had to use the straight-forward language to which he was accustomed in preaching, as well as in common life, he succeeded very well.

About this time, Bunyan lost his first wife, who left him with four children—one of them a blind daughter. He appears to have soon after taken another spouse, whose first name (Elizabeth) is alone known. Though he thus far complimented the fair sex, it is certain that he entertained no high opinion of it in general.

In his business of itinerant preaching, Bunyan liked to go to what he called "the dark places of the country," and there can be no doubt that his life was an useful one. He was destined, however, to undergo tribulation on account of his modest and gratuitous labours. While in Bedford he was generally respected as he deserved, there were not wanting in-

---

* For the following note respecting Bunyan's birth-place, we are indebted to Mr Carruthers, editor of the Inverness Courier:—

"I visited the spot where Bunyan was born, one day in the spring of 1826, and shall not readily forget my morning's walk, and its accompanying circumstances. The landscape was truly English, and every thing seemed joyous and animated. The trees had not yet put on their glorious garniture of leaves, but the brooks were perfectly transparent—the meadows rich with verdure; and here and there a tall fir-tree shot its green spiral branches into the air, and glistening masses of ivy twined round the trunk and arms of some old oak, or completely enveloped the marshy hollands and stunted elms. Birds were singing gaily in the lanes and hedges, husbandmen were busy sowing in the fields, and schoolboys equally busy 'nesting,' or 'violetting' in all the luxury of the Easter holidays. The poor man's spot of garden ground showed its knots of spring-flowers, and its border of daisies, primroses, and crocuses, with its budding gooseberry and currant bushes, while the mistress of the cottage might be seen twirling her mop at the door in the sunshine, and thanking Providence for 'the beautiful fine weather.' The house at Elstow where Bunyan lived, and carried on his father's business of a brazier, is still pointed out to strangers. It is a low narrow building, consisting of a room and closet on the ground floor, and a bed-chamber above. The front is coloured, like most of the houses in the village, with yellow ochre, and behind there is a small garden, which formerly contained the forge at which Bunyan used to work. The ceiling of the house is not plastered, and exhibits the same 'roof and rafters' that the pilgrim was wont to contemplate. Its present occupant is an aged widow, who appears to entertain a deep veneration for the memory of 'Mr Bunyan.' Many people, she said, came to see the house, and a gentleman of Bath had taken a drawing of it. The chapel at Bedford in which Bunyan preached is designated 'Bunyan's old meeting-house;' and the arm-chair on which he used to recline after his pulpit labours is carefully preserved in the vestry. They show the pew in Elstow church in which he used to sit (with his name cut on the boards), and the particular bell he was fond of ringing. The church of Elstow is part of a landscape worthy the happiest aspiration of a painter or poet. The building was originally an abbey of Benedictine nuns, which was dissolved at the Reformation; and it stands on a large secluded green at the end of the village, inclosed by aged oaks and plum-trees—at the time I saw them, white with blossoms. In front of the church porch is the ruined pedestal of a sun-dial, and adjoining the chancel are the remains of the conventual buildings, their grey walls decorated with ivy, shrubs, and flowers. Bunyan was a stern, austere, sectarian; but the recollection or the sight of the beautiful village church in which he was baptized, and whose bells he was so fond of ringing when a boy, must sometimes have been like dew to his toiling and troubled spirit, as he 'walked through the wilderness of this world.'"

* Southey's Life of Bunyan.

* Quarterly Review, No. 86.

† It seems to be the opinion of Bunyan's biographers in general, that this was the only book he possessed or studied, besides the Bible. Any one, however, who attentively peruses the Pilgrim's Progress, will find many passages which attest his familiarity with other books, and those belonging to what he would consider as profane literature. His lines beginning

> "Who would true valour see,
> Let him come hither;
> One here will constant be,
> Come wind, come weather," &c.,

must have been written in imitation of the delightful song in "As you like it." In his vision of Heaven, when discoursing on blessed spirits, he says, "A divine beauty in them ever durable, a beauty that *darts no contagious fires*." The words in italic seem to point to Milton's Description of Eve, whose "eye darted contagious fires," after eating the forbidden fruit. It will also be recollected, that, in his Vision of Hell, he introduces Hobbes, the sceptical philosopher of Malmesbury, as an interlocutor in the infernal regions, to which he had been condemned, in the fancy of Bunyan, for writing his "Leviathon."

dividuals belonging to hostile sects, who regarded his exertions with great jealousy, and endeavoured, by slanders, to ruin his reputation. It was insinuated that he was a Jesuit in disguise—that he was a highwayman—nay, even a witch—all of which suppositions show that he had begun to exercise no small influence over his fellow-creatures.

In 1657, though the sway of Cromwell produced more toleration than usual, an indictment was preferred against him for preaching at Eaton. This attempt to silence him was defeated; but immediately upon the Restoration, when the episcopal forms were re-established, he fell under a prosecution for preaching; and, on his avowing a fixed resolution to continue that practice, was imprisoned in Bedford jail. The dismay of his wife on this occasion caused her to fall into premature labour, and give birth to a dead child; but Bunyan, for his own part, rejoiced in his sufferings, in the hope that they would help the cause he had espoused. He was now completely separated from his pots and kettles, and might have been in great pecuniary distress, if he had not taken up a new trade equally humble with the former—the making of tagged thread laces. His confinement was to continue till he should promise to abstain from preaching; but, in the course of time, his jailor relaxed so far as to permit him to go abroad occasionally, to hold devotional communion among his friends. He was even allowed to pay a visit to London; and in the last year of his captivity he was chosen minister of the Baptist congregation—which could not have taken place if he had not enjoyed a considerable share of personal liberty.

Of sixty religious tracts and pamphlets, written by Bunyan in the course of his life, it is probable that many were composed in Bedford jail. These works, however, are of so little value, that they would have now been unworthy of notice, but for his "Pilgrim's Progress," which he also wrote in prison. Of this great classic of the common people—one of the most felicitous works ever penned—no copy of the first edition is now known to exist, and the date of its publication is therefore unknown. It must have appeared, however, before 1679, as the second edition, a copy of which is in the British Museum, is dated in the preceding year.

Bunyan was now the regular minister of the Baptist congregation, and was well known both as a writer and a preacher—his fame being so great in the latter capacity, that when he preached in the metropolis, which he occasionally visited, three thousand persons would come to the little chapel in Southwark, where he was to hold forth, being a far larger number than what could gain admittance. His book, in one sense, was truly original: it was the grand effort of a powerful, though unlettered genius; and it has never been approached by any imitator. How far, however, the author was indebted for his plan, and some of the details, to preceding intellects, is not so clear. Works of this allegorical kind are not uncommon in the early part of the seventeenth century. So early as 1629, the famous Mr Zachary Boyd, minister of Glasgow, published his "Last Battell of the Soule," in which such characters are introduced as Pastour, Sick Man, Spiritual Friend, Carnal Friend, Sathan, Michael, &c. A poem, entitled the Pilgrimage, which appeared in Whitney's Emblems, accompanied by an engraving, might, it is said, have given the hint for the Pilgrim's Progress; and it is curious that in 1672 was written (though it did not appear till 1678—the date of Bunyan's second edition, and perhaps also of his first) a short discourse by Dr Simon Patrick, dean of Peterborough, entitled the "Parable of a Pilgrim," in which, under the semblance of directions for a journey to Jerusalem, the learned author communicates many moral and religious instructions, and even introduces various persons representing different denominations of Christian believers. Still, making every allowance for hints and ideas variously procured, the honour of having written this happy book, which combines all the vivacity and entertainment of a novel with the profoundest religious knowledge, and the most persuasive instruction, remains to John Bunyan, as one of the highest that can belong to any literary name. The work is translated into almost all civilized languages, and, though tinged in some parts with the author's peculiar tenets, is read by almost all classes of religious thinkers. There has even been a kind of Roman Catholic paraphrase of it—in which, of course, one particular character, not spoken of in the most respectful manner, is omitted.

The success of the Pilgrim's Progress induced Bunyan to compose a second part, which, though written with equal felicity, produces upon the whole less impression on the mind of the reader. He also wrote an allegorical work, called "the Holy War made by King Shaddai upon Diabolus, for the regaining of the Metropolis of the World; or the losing and retaking of Mansoul,"—an idea bearing a still stronger resemblance, it must be acknowledged, to the dramatic poem of Mr Zachary Boyd, just alluded to.

He survived his enlargement from prison sixteen years, during which he employed himself diligently as a preacher, both in Bedford and in other places. It speaks much to his personal worth as a man, that he was indefatigable also in administering to the temporal wants of the oppressed non-conformists of those days, and in promoting brotherly kindness among the individuals over whom he had any influence. He at length died, August 12, 1688, in consequence of a cold caught during a journey which he undertook for the purpose of reconciling a father to his son, who was threatened with disinheritation. This event took place at London, and he was interred in Bunhill-fields burial-ground, where a monument has been erected to his memory.

DESCRIPTION OF A MAN-OF-WAR VESSEL.

Having long been desirous of falling in with a well-written account of the arrangements and general economy on board of a man-of-war vessel, we have at length been so fortunate as to discover an admirable description of this nature in a recent work, entitled "Two Years and a Half in the American Navy, by E. C. Wines. Bentley, London." It applies to an American frigate, which, we believe, does not differ from a similar vessel in the British navy.

"A frigate (says this entertaining author) has three decks. The upper one is called the spar-deck, and this is again subdivided into different parts, each called by its appropriate name. All that part of it from the gangways aft, is denominated the quarter-deck. Next to the cabin, this is the most sacred part of the ship. No officer on duty is allowed to appear there unless he is dressed in his uniform, and on ascending to it from below, or in coming over the ship's sides, he is obliged to pay it his respects by touching his hat. I have been reprimanded for walking there in a hot summer's day without a cravat on, and the etiquette of touching the hat is in some instances so rigorously exacted, that midshipmen are suspended or quarantined for neglecting to comply with it.

In port, the starboard side* of the quarter-deck is appropriated to the captain and wardroom officers, and the larboard to the inferior officers. I have seen a sailor taken to the gangway and receive a dozen for walking aft on the starboard side of the deck. At sea the higher officers are entitled to the weather side, that is, the side upon which the wind blows, whichever it may be.

There are three hatches on the quarter-deck, the after one of which belongs exclusively to the superior officers. Near the centre is the capstern, a large wooden cylinder, by means of which the anchor and other heavy weights are raised. The wheel, at which four men are stationed to steer the ship, is just *forward* of the mizen-mast, and in front of it are the binnacles, two upright boxes, in each of which is placed a mariner's compass.

That part of the spar-deck forward of the foremast is called the forecastle. This is the favourite haunt of the men. Here they collect on a summer's evening to 'spin' their 'yarns' and forget their labours in the pleasures of the song and the dance. The blacksmith's shop is always shipped on the forecastle, when any work in that line is to be performed.

On that portion of the spar-deck, comprehended between the quarter-deck and the forecastle, are stowed all the spare spars, and also at sea all the boats, except one at the ship's stern, and one on each of her quarters. It is called the booms. On the spar-deck there are four ladders for the men, two of which are just forward of the gangways, and two just abaft the foremast. Parallel with this deck are six strong platforms, outside of the bulwarks, three on each side of the vessel, opposite the three masts. They are called the fore-main, and mizen chains. The shrouds, stout cable ropes which support the masts laterally, are fastened to them. The ropes which give a fore-and-aft support to the masts are denominated stays.

The guns on this deck are called carronades, and are all short, except generally two long carronades on the forecastle, and two on the quarter-deck. The bulwarks rise to about the height of a commou-sized man above the spar-deck. They terminate in the hammock-nettings, a deep trough nearly encircling the ship, in which the hammocks are stowed during the day. In foul weather the hammocks are protected by a tarred canvass cloth thrown over them, but in fair weather this tarpaulin is rolled up and laid on the top of them, so as to leave them almost entirely exposed. Nothing contributes more to the good appearance of a ship than clean hammocks, neatly stowed.

I will now conduct my reader down to the main, or gun-deck. This is the great luxury of a frigate, as it furnishes a fine promenade in all weathers. The sun, rain, and dews, are all excluded—things which annoy you prodigiously on board of a sloop. We will commence with the captain's cabin. This occupies nearly all the space on the main-deck abaft the mizen-mast, and encloses four guns. It is separated from the rest of the deck by a partition, called, as all partitions on shipboard are, a bulkhead, which is always removed when the ship is cleared for action.

The portion of the gun-deck, extending from the cabin to the main-mast, is denominated the half-deck. The larboard side of this is also appropriated to the officers, but it wants the sacred character of the quarter-deck. Its use is common to officers of every grade. It is constantly occupied as a promenade, and in summer is the general reading-room. That part of this deck comprehended between the main-mast and the galley, is called the waist, and here the carpenters, tailors, shoemakers, &c., carry on their respective businesses. The galley is just abaft the foremast, and is the ship's kitchen. The forward part of it is appropriated to the officers cooking. This is divided into three compartments, of which that on the larboard side is for the use of the captain, that on the starboard for the use of the wardroom mess, and that in the centre for all the officers below them. The after part of the galley is called the 'coppers,' and belongs to the crew. On each side of the galley is a suspended table for the use of the cooks.

The after-part of the berth-deck is occupied as a mess-room by the lieutenants and other commissioned officers. It is called the wardroom, extends to a considerable distance forward of the mizen-mast, and is separated from the rest of the deck by a bulkhead. It has five state-rooms on each side, which, though not very large, are sufficiently commodious, and are furnished with neat little bureaus at the public expense. Some of the officers have them carpeted and fitted up in elegant style. The first lieutenant is entitled to the first state-room on the starboard-side, and the others follow him in the order of their rank. The room on the larboard-side, corresponding to the first lieutenant's, belongs to the sailing-master, and the purser, surgeon, and chaplain, are entitled to rooms receding from his in the order in which their names are here mentioned. The wardroom receives its light principally from a large skylight over head.

Immediately forward of the wardroom is the steerage, the midshipmen's domicile. This differs materially in different ships. In some, as in the Constellation, it is partitioned off into different mess-rooms; while in others, as in the Brandywine, it is all common, and is separated from the forward part of the deck only by a canvass curtain. In the Constellation there are four mess-rooms, two on each side of the ship. They are each about nine feet by seven. The *middies* are not allowed to have trunks on board, and the mess-rooms are therefore furnished with lockers to supply their place. Of these there are two kinds, chest-lockers and 'up-and-down' lockers. The chest-lockers are nothing more than boxes surrounding three sides of the rooms: the upright ones are more like bureaus, and are much more commodious.

Immediately forward of the steerage are four state-rooms, occupied by the forward officers, and between them are four mess-lockers (small store-rooms), where the provisions of the steerage and cockpit are kept. Here is also an air-pump, by means of which the foul air is removed from the lower parts of the ship.

We are now forward of the main-mast, and have come to an open part of the deck, lined on each side by a row of chests. Each of these is appropriated to one of the ship's messes, and contains its table, furniture, and daily provisions. Here are also compartments, formed by upright wooden grates, and extending on both sides of the ship, from the state-rooms of the forward officers to the sick-bay, in which the men keep their clothes. The sick-bay, or apartment for the sick, is a small room quite at the forward extremity of the berth-deck. On each side of this deck there is a row of air-ports, designed chiefly for the purpose of ventilation, which extend from one end of it to the other. They are open only in port.

I will not detain the reader by a minute description of a frigate's lower regions. Underneath the wardroom are the magazine and principal bread-room. The cockpit and spirit-room are below the steerage, and directly forward of them is the main-hold, which extends over no inconsiderable portion of the ship. Here are stowed the cables, water, and most of the provisions. The forward officers' store-rooms are underneath the sick-bay. The various implements of their respective crafts are kept in them, and they are generally fitted up with a good deal of taste and elegance. This is a part of the ship always shown to strangers, and which, if kept in proper order, generally excites more interest than any other.

The government on board a man-of-war is despotic, and must be so from the circumstances under which it exists. Men are here congregated together from almost every country under heaven. They bring with them no natural principles of amalgamation, but, on the contrary, almost as many apples of discord as there are individuals in the crew. Nothing but necessity can bind into one harmonious whole so many discordant elements, and that necessity must result from a system of discipline, stern in its nature and prompt in the execution of its penalties. If the commander were not, in a manner, clothed with the power of a despot, neglect of duty would often go unpunished, confusion would soon be worse confounded, and the secretary might order every vessel in the navy to be set on fire, dismiss his clerks, and retire from the toils of office to enjoy the quiet of his own fireside.

Time on shipboard is divided into watches, and reckoned by bells. Hence you never hear the question, 'What's o'clock?' but 'How many bells is it?' The twenty-four hours are divided into six equal portions, called watches. At the end of the first half-hour of one of these portions, the bell is struck one; at the end of the second, two; and so on, till the series reaches eight, when it commences again. Thus it will be perceived that two bells means either one, five, or nine o'clock; and five bells either half-past two, six, or ten. In the ship's journals, the dates are put down according to the common mode of reckoning time.

The division of time into watches differs somewhat at sea and in port. In the former case the watches are all four hours long, with the exception of two in the evening, called dog-watches, from four to six, and from six to eight. In port there is but one watch during the day, viz. from eight o'clock A.M. to eight P.M. The night-watches are the same as at sea.

Order is the first great rule on board a man-of-war, and that to which all others must bend. From day to day, from week to week, from month to month, and from year to year, the same stroke of the bell is followed by the same whistle, the same call, and the recurrence of the same duties. Every thing has its place too, and must be kept in it. So true is this, that a person acquainted with the details of a ship, can lay his hand on a given object in any part of her as well in the dark as if a thousand suns were shining on it. To the same grand principle—ORDER, are to be attributed the numerous divisions and subdivisions of the officers and crew.

The whole number of persons on board the Constellation varied at different times from three hundred and eighty to four hundred and twenty. The three grand divisions of the moral elements in the naval service are into officers, men, and marines. Of the former there were generally about forty; of the second, somewhat more than three hundred; and of the latter, thirty-five, more or less.

At the head of the list stands the captain. He is literally 'monarch of all he surveys,' and 'sitteth secure

* As you stand facing the ship's head, the starboard is on your right, and larboard on your left. The larboard side is also called port.

in high authority and dread.' His will is supreme; and from his decisions, for the time being, there is no appeal. He has a general superintendence over the affairs of the ship, and every order of a general nature must originate in him. No important alteration can be made without his knowledge and consent. It is his duty to take a general oversight of the officers' conduct; to see that they are guilty of no improprieties, and to punish such as are. He is responsible for the safety of the ship, both at sea and in port. If any business of a public nature is to be transacted with a foreign power, it falls of course into his hands. These are his duties in time of peace; in war he has still higher responsibilities.

From this brief exposition, it will readily occur to the thinking mind that the commander of a government vessel ought to be a man of good natural endowments and varied acquirements. Courage, moderation, and judgment, comprehension of intellect sufficient to view a subject in all its bearings, a keen sagacity in discriminating between the distinctions of subtle minds, and a general acquaintance with the usages of nations, are indispensable, not only to his own fame, but also to the reputation and interests of his country. Hence it appears that the qualifications requisite in a captain of the navy are by no means such as can be acquired by a dunce, or even by a man of understanding, without much study and reflection.

Next in rank come the wardroom officers, consisting, on board of a frigate, of six lieutenants, a purser, surgeon, chaplain, sailing-master, and lieutenant of marines. The first lieutenant is next in power to the captain; and though his station is less responsible, his duties are more laborious. He has a general supervision over the ship, and is to see that she is kept clean and in proper order. To this end he is obliged to inspect every part of her at least once a-day, and report her condition to the captain. When the ship is put in commission, it devolves chiefly upon him to station the men, a business of the most laborious and difficult nature, requiring great patience, a discriminating judgment, and deep insight into the human heart. It is his duty to have the men frequently exercised at the guns; to regulate the expenditures of certain public stores; to take care that the men keep themselves clean and decently clad; to superintend the watering and victualling of the ship; and, in short, to see that all her multifarious and complicated concerns move on regularly and harmoniously. In coming to an anchor and getting under weigh, and when all hands are called to reef topsails, or for other purposes, he takes the trumpet. On him, more than on the captain himself, depends the comfort of the officers. In port, it belongs to him to grant or withhold permission to go ashore; and there are a thousand other ways, in which, if he is a man of capricious or malignant disposition, he can gratify his whims or his spleen at the expense of the comfort and feelings of his fellow-officers. The qualifications most needed in a first lieutenant are freedom from caprice and passion, fixed principles of action, moderation combined with decision, a dignified affability, a disposition to be at once liberal and just, and a profound knowledge of character. On the whole, his situation, though highly important, is not very enviable; and my observation has satisfied me that to be generally popular as a first lieutenant, requires a combination of qualities, such as rarely falls to the lot of any man.

The other lieutenants are divided into watches, and take turns in performing the duties belonging to their station. The lieutenant on duty is styled in writing the officer of the watch, but is familiarly called the officer of the deck. Some of his duties are common at sea and in port, and others are peculiar to each of these situations. In both he is responsible for the deck while he has charge of it, and has also to take a general oversight of the ship. He must see that the men's rations are properly cooked, and that they have their meals at proper hours. The serving of the grog is also under his control. At sea his duty is to sail the ship, keeping her on the course given her by the captain, and reporting to him any change in the wind, the discovery of land or strange sails, and any extraordinary occurrences. At night he has (the captain waked at stated periods,* and the state of the weather reported to him. On receiving the trumpet, the first thing the officer of the deck does is to glance at the compass, the sails, the dog-vane, the sky, and the water, to discover the state of the ship, the wind, and the weather; and at the end of the watch, he must have a general account of the weather, and other matters which he may deem proper, inserted in the ship's log-book. The duty of the officer of the deck in port is to receive any supplies of water or provisions which may come alongside, to regulate the sending away of boats, to keep a look-out as to what is going on in the harbour, to report the arrival of ships and any important occurrences to the captain, &c. The lieutenants are also officers of divisions, and frequently have to exercise the men at the guns, besides superintending the monthly issues of slops to their respective divisions.

Next in rank to the lieutenants, I suppose, would come the regular sailing-master, but the duties of this office are almost universally performed in the American service by passed midshipmen, who have received merely acting appointments. After the first lieutenant, the duties of a sailing-master are more comprehensive and arduous than those of any other officer. His supervision and responsibility extend to almost all the public stores in the ship, but particularly to the water, spirits, cables, and anchors. He reports the daily expenditures of water to the captain. It is his business to keep the ship's place, and report it at least twice a-day to the commander, together with the bearings and distance of the port to which she is bound, or the nearest land desired to be made. Some commanders leave this entirely to their sailing-masters.

There is no berth on board a man-of-war more cozy than that of purser. He holds the keys of the strong-box, and though his regular salary is not much, his emoluments, arising from other sources, are greater than those of the commander himself. All the provisions on board are committed to his charge, and the ship's accounts are all kept by him. His responsibilities are very great, and heavy bonds are therefore justly exacted from him.

The surgeon and his two assistants form the medical staff of a frigate. The assistant-surgeons form a distinct class of officers, ranking between the wardroom officers and midshipmen. In frigates and ships of the line they mess in the cockpit, but in all other public vessels in the steerage. The business of the staff is of course to take care of the sick, and perform such surgical operations as may be necessary. A daily journal is kept of the names, rank, diseases, and constitutional habits of all the sick on board, and also of the medicines administered to them. From the journal a report is made out and signed by the surgeon every morning, stating the names, rank, and diseases of the sick, and the number added to and taken from the list. This is handed to the captain. Another list, containing only the names, is placed in the binnacle for the use of the officer of the deck. Nothing will excuse either an officer or a man from duty, but the fact of his being registered on the sick list. A general review of the sick takes place every morning after breakfast. One of the assistant-surgeons inspects the ship's coppers every day, to see that no verdigris is allowed to collect upon them. It is the duty of the surgeon not only to attend to the sick, but also to recommend and enforce such precautionary measures as will have a tendency to prevent disease, and thus secure the general health of the officers and crew.

The laws of the United States make it the duty of the chaplain to perform divine service twice a-day, and preach a sermon on the Sabbath, unless bad weather or other extraordinary occurrences prevent it. The former of these duties is never fulfilled, and the latter rarely.

The lieutenant of marines has few duties of any kind to perform. His office, though necessary as long as the marine corps is continued, is nearly a sinecure.

I come now to the midshipmen, *alias* the young gentlemen; for by this name they are always called on shipboard. The number of these varied on board of the Constellation, at different times, from fifteen to upwards of twenty. It would be difficult to give any very definite idea of what their duties are; for, although an interesting class of officers on account of what they are to be, yet, in their present capacity, they do little more than echo the orders of their superiors. There is a change of wind; the officer of the deck orders the men to 'Lay aft to the braces!'—'Lay aft to the braces!' cries every midshipman on deck. The wind freshens so as to make it necessary to clue up the mainsail: 'Man the main clue garnet!' is thundered through the trumpet:—'Man the main clue garnet!' is instantly repeated by some half dozen echoes. However, they have some specific duties. They carry messages from the officer of the deck to the captain, and in port one of them takes charge of every boat that leaves the ship. At sea, seven bells is reported to them every morning at half-past eleven, when they are obliged to go on deck with their quadrants, and take the sun. They have to work out the last day's run, and report the course, distance made good, and ship's place at noon each day, to the captain. They muster the crew when the watch is called at night. They are also required to keep a journal of the cruise, which is, however, only a copy of the ship's log. This is examined every few weeks by the commanding officer; and if it happens not to be written up when called for, the delinquent is generally punished by a curtailment of some of his indulgences.

Five of the oldest midshipmen are master's mates. Their duties are more important and responsible than those of the others. The master's mate of the hold superintends the expenditures of provisions, water, and spirits; keeps an accurate account of the quantity of each expended daily, and reports it to the proper authority. He also makes the rough copy of the ship's log from the log-slate. This is afterwards transferred to another book, called the smooth log. In both, the different officers of the deck put their signatures to the remarks made by their authority. It is the duty of the master's mate of the gun-deck to keep the deck in good order, and to prevent improper conduct on the part of the men. In addition to this, he oversees the serving out of grog and provisions. There are three master's mates of the watches, that is, one to each of them. Each in turn has charge of the forecastle, and, at the end of every hour, it is his business to heave the log, to ascertain the ship's rate of going. This he reports to the officer of the deck, who, making such allowance as he chooses, tells him to give her such a rate and course, and directs him to make such remarks on the log-slate as he (the officer of the deck) may deem proper.

The boatswain, gunner, carpenter, and sailmaker, form a distinct class of officers, called forward-officers. I shall not enter into the particulars of their duties. The boatswain is charged with the rigging of the ship, and in port attends to squaring the yards. You may know him by his silver whistle, rattan cane, and above all by the ruddy hues of his countenance, and the odious vapours that issue from his mouth. The gunner has charge of the military stores, and, when all hands are called, of the main rigging. The carpenter is responsible for the stores belonging to his department, and superintends the corking of the ship, and other work performed by his subalterns. The sailmaker is charged with the sails, hammocks, and generally all the canvass in the ship. At sea, he is obliged to go aloft on each of the three masts, examine the condition of the sails, and report it to the first lieutenant every morning before breakfast.

The midshipmen of the Constellation were obliged to ask permission of the captain to go ashore. On one occasion, when all the officers above the third lieutenant were absent from the ship, some of them applied to him to go ashore. Permission was promptly given. When the captain returned and learned who were ashore, he sent for Mr ——, to inquire into the matter. 'Sir,' he replied, 'I was at the time acting commander of the ship, and had both the power and the right to do as I did.'"

(To be concluded in our next.)

* On board of the Constellation every two hours.

EFFECTS OF THE PRINCIPAL ARTS, TRADES, AND MANUFACTURES.

Masons (says Mr Thackrah, in his instructive work on the effects produced by working at different professions) inhale particles of sand and dust, which arise from chipping the stone. They often use great muscular exertion in lifting weights; they are exposed also to the vicissitudes of the weather; they are addicted to intemperance. We promptly find the effects of these circumstances on their physical state. From their exertion in the open air, their face has colour, and the figure is muscular and robust: inhaling dust, the bronchial membrane is often in a state of chronic inflammation: dissipated in their habits, they become susceptible of atmospheric changes, and hence are frequently affected with pains in the limbs: finally, from the combination of these injurious agents, dust and dissipation, and the mutual reaction of morbid states thus induced, masons are short-lived, dying generally before they attain the age of 40.

The subject leads me to refer to the state of Miners, though their occupation is not strictly a part of my paper, nor one which I have had the opportunity personally to examine. In the mines in the north of England, the workmen, I am informed, suffer considerably when employed in ore in the sandstone, but are sensible of no inconvenience where the ore is in limestone. I am indebted to an intelligent friend for the following information:—"The reason they assign is, that the latter is full of vertical and other fissures, which allow the superincumbent beds of water to percolate through the roof of the mine; whilst the sandstone strata, which are impervious to water, preserve the mine quite dry; consequently, the minute particles of rock formed by blasting or the pickaxe, are kept in a dry state within the sandstone mine, forming, as it were, an atmosphere of dust, which the miner is constantly inhaling. In the limestone mine, the particles, on the contrary, are laid as they are formed, by the continuous oozing, dropping, and splashing of the insinuating water. Some miners account for the difference by the solubility of the limestone. Miners rarely work more than six hours a-day, yet they seldom attain the age of 40. They take immense quantities of ardent spirits, not with the view of enabling them the better to sustain their unhealthy employment, but confessedly to drown the ever-recurring idea, that they are, from their occupation, doomed to premature disease. Last year, there were in the village of Arkendale (in the heart of the mining district) not less than thirty widows under 30 years of age. The prevalent maladies appear to be affections of the lungs and bowels. Smelting is considered a most fatal occupation. The appearance of the men is haggard in the extreme. The Alstone Moor miners repair annually in great numbers to Cartmel Holywell, where they derive great benefit from that saline water."

The latter part of this statement is surely melancholy enough to call forth the active sympathy of all who witness the facts. If the injury to health and life result from the dust of the sandstone, could not the simple remedy of water be applied? If water will not percolate through standstone, might not the frequent use of a common watering-can prove a substitute?

A parallel case to that of the miners occurs in the Grinders of Sheffield. Dr Knight, in the North-of-England Medical Journal, states that the fork-grinders, who use a *dry* grindstone, die at the age of 28 or 32, while the table-knife grinders, who work on *wet* stones, survive to between 40 and 50.

Machine-Makers are divided into several departments. The founding produces only the slight and temporary annoyance of dust from the charcoal sprinkled on the mould. The men, in Leeds at least, are generally healthy. Dressing the iron, technically called "fetling," seems to be equally innoxious.

Turning, boring, and grooving wrought-iron, present nothing remarkable. But the *turning of cast-iron* is so laborious, that the men can scarcely bear it for the whole of the day. The particles of iron cast off in the process are large, and do not, consequently, affect the lungs in a sensible and great degree.

Draw-filing cast-iron is a very injurious occupation. The dust is much more abundant, and the metallic particles much more minute, than in the filing of *wrought*-iron. Does this difference arise from the texture, the degree in which the particles are united in wrought and cast-iron; or does it arise from the manganese and magnesia contained in the latter? The particles rise so copiously as to blacken the mouth and nose. The men first feel the annoyance in the nostrils. The lining membrane discharges copiously for some time, and then becomes preternaturally dry. The air-tube is next affected. Respiration is difficult on any increase of exertion; and a habitual cough is at length produced. At the same time, the digestive organs become impaired; and morning vomiting, or an ejection of mucus on first rising, is not infrequent. The disorder varies of course with the constitution of the individual; but the common termination, when men pursue the employment for years, is bronchial or tubercular consumption. The frequency of these fa-

tal diseases is easily explained. The sensitive membrane lining the air-tube and air-cells is irritated by the particles of iron inhaled at every breath: chronic inflammation becomes established; the constitution is seriously injured by the quantity of muco-purulent matter which is discharged, by the want of a full purification of the blood, and by the exhaustion which habitual cough produces: hectic fever and emaciation succeed. More certainly fatal is the case, where there exists in the constitution a predisposition to the tubercular form of the disease. The researches of the French pathologists, as well as our own observations, prove the cartilaginous bodies, called tubercles, to be very frequent in the human lungs, to be slow in assuming a destructive character, and often to remain crude or latent for an indefinite period. The subject of the present paper scarcely requires a detail of the progress of these bodies, as affected by external agents and internal excitement—their augmentation, coalescence, change of hue, softening, the final purulent expectoration, by which successive masses are removed, and the effects produced on the lungs, the air-tube, and the constitution. Suffice it to urge, that a great proportion of our population is born with tubercles, or a disposition to the formation of these bodies; that various agents in civil life tend powerfully to excite their developement, and none more than irritation of the bronchial membrane. This membrane is affected by gaseous agents, but much more by palpable substances. Dust of every kind irritates, but not in an equal degree. Much, I conceive, depends on the size and figure of the particles which enter the air-tube. The dust from the roads produces no apparent mischief, while the mason's chippings from the stone occasion serious and often fatal injury to his lungs. The dust from old iron, which is thrown off so copiously as to deposit a thick brown layer on the dress of the dealers in this article, produces no inconvenience; while the less apparent detachment of particles by the file is decidedly baneful to the workers in iron. It is, then, the *form* rather than the material, the spiculæ, the angular or pointed figure of the particles detached, which we conceive the chief cause of injury.

The filers are almost all unhealthy men, and remarkably short-lived. One instance only in this neighbourhood can we find of a man's following the employ for 20 years. At two of the principal machine manufactories of Leeds, there are only two filers of the age of 48; and in neither case, I believe, has the individual pursued the labour uninterruptedly from boyhood. The mortality among machine-makers is not the result of intemperance; for the men, in this neighbourhood at least, are generally steady. It is not the result of error in diet, clothing, or exercise. It can be ascribed only to the nature of the employ, and the train of baneful effects to which I have adverted.

What can be done to prevent this lamentable waste of life? Magnetic mouth-pieces, which attract the particles of iron inhaled in respiration, and thus greatly diminish the quantity which would enter the air-tube, were many years ago introduced in Sheffield, and ought ere this to have been tried in Leeds. But there is a strange apathy among both the men and the masters. Though very intelligent, and conversant not only with the science of their manufacture, but often also with knowledge in general, they are remarkably thoughtless on a subject which most deeply concerns them. Man after man dies of decay in the prime of life, and no warning is taken by the survivors. Machine-makers, indeed, are generally unwilling to admit the fact of excessive mortality. They naturally dislike the idea of being more subject than their neighbours to disease and death. They will rarely admit that they labour under disorder, till consumption is established, and its effects apparent to every observer. To our general questions, they reply, "We are all pretty healthy." And it is only by examining each workman that we find the deception. Had they the providence and the courage fairly to examine this important subject, some measures would be devised for correcting the evil. Magnetic mouth-pieces, or some contrivance still more effectual, would be speedily adopted. Though their own knowledge is much more likely to avail than any suggestion of mine, I would ask, if a change can be made in the smelting of iron, or advantage obtained by farther purification? The working of wrought-iron we find to be much less injurious to health than that of the cast.

The preceding remarks apply chiefly to the iron-work in the making of machines. The *brass* work must also be noticed. The *founders* suffer from the inhalation of the volatilized metal. In the founding of *yellow* brass in particular, the evolution of oxide of zinc is very great. It immediately affects respiration; it less directly affects the digestive organs. The men suffer from difficulty of breathing, cough, pain at the stomach, and sometimes morning vomiting. We did not find one brass-founder more than 40 years of age, though we have since been informed that there are two brass-founders in the neighbourhood, of the ages of 60 and 70, who have continued at the employ from boyhood. The *Turners, Filers*, and *Dressers of Brass*, do not seem to be more unhealthy than the generality of our townsmen. We observe among the filers, the hair of the head changed to green.

Braziers are subject to the noxious exhalations from the solder, but their employments are so varied as to preclude exposure to its influence for a considerable time at once.

Copper-Smiths are considerably affected by the fine scales which rise from the imperfectly-volatilized metal, and by the fumes of the "spelter," or solder of brass. The men are generally unhealthy, suffering from disorders similar to those of the brass-founders.

Tinplate-Workers are subjected to fumes from muriate of ammonia, and sulphurous exhalations from the coke which they burn. These exhalations, however, appear to be annoying rather than injurious, as the men are tolerably healthy, and live to a considerable age. Tinners also are subject only to temporary inconvenience from the fumes of the soldering.

Plumbers are exposed to the volatilized oxide of lead, which rises during the process of "casting." The fumes frequently induce vomiting at the time; and men who are much in this department are soon seriously injured. The common working of the metal also seems to be deleterious. A sweet taste is often perceived in the mouth during the beating of lead, and fumes arise from the application of the solder. Plumbers, however, though sickly in appearance, do not generally complain, nor are they, in this neighbourhood at least, where casting is rare, frequently off work from illness. We were informed that in a sick club containing 25 members, two individuals only have applied during the last year for assistance, and one of these had been burnt by accident. It is nevertheless apparent, that the occupation undermines the constitution, for plumbers are short-lived. I learn that there are but two individuals in Leeds and the neighbourhood, who have regularly pursued this employ, beyond the age of 40.

Is there no substance which, being volatilized at the same time, would combine with the oxide of lead, so as to produce a less injurious compound?

THE KENTUCKY CAVERN.

In the month of December 1826, the writer, in company with another gentleman, being on his way from Louisville to Nashville, took occasion to visit this cave. Its entrance was in a steep declivity of a hill. The dimensions of the mouth are about forty feet in height by fifty in breadth, decreasing gradually for the first half mile, till the cavern is no more than ten feet in height and as many in breadth; at which place a partition has been erected, with a door of convenient dimensions, for the purpose of protecting the lights of visitors. There is at this place a current of air passing inwardly for six months, and outwardly for the remainder of the year. Sufficiently strong is it, that, were it not for the door that has been made, it would be impossible to preserve an open light. It is called the mouth as far as this place, on account of its being the extent of the influence of daylight, which here appears like a small star. Formerly, when the cavern was first discovered, this part was nearly filled with earth, which has been recently manufactured into saltpetre.

Having prepared ourselves with a sufficient quantity of provision, oil, and candles, and taking two persons as guides, we took our last view of the daylight, and proceeded forward, closing the door behind us. Immediately we found ourselves in thick and almost palpable darkness: the whole of our four lights spread but a feeble radiance about us. Such is the height at this place, that we were hardly able to discover the top; and to see from one side to the other was utterly impossible. From this place extended several caverns, or, as travellers have named them, rooms, in different directions. This part of the cave is called the "first hopper." The soil at the bottom of the cave is very light, and strongly impregnated with salt. The sides and top are formed of rock. We proceeded forward, passing several rooms on our right, and one on our left, until we arrived at the second hopper, a distance of four miles from the mouth. About a mile in the rear of this, was pointed out to us by our guide the place where the celebrated mummy was found, which is now exhibiting in the American museum of New York. It was found in a sitting posture, by the side of the cavern, enveloped in a mat, and in a complete state of preservation.

We next entered the room denominated the "haunted chamber." It is nearly two miles in length, twenty feet in height, and ten in breadth, extending nearly the whole length in a right line. The top is formed of smooth white stone, soft, and much resembling the plastering of a room.

There is a small quantity of water constantly (though almost imperceptibly) falling from above, which, in the course of ages, has worn out from the stone at the top some beautiful pillars, which extend to the bottom of the room. They have the appearance of being the work of art. In one of them, there is formed a complete chair, with arms, which has received the name of "arm-chair."

By this side is a clear pool of water, strongly impregnated with sulphur. The sides of the room are likewise elegantly adorned with a variety of figures, formed from the stone at the top, and coming down upon the sides of the cavern, like icicles in the winter, from the eaves of buildings, the reflections of our lights upon them forming a most brilliant appearance. At the end of this room we descended a kind of natural staircase, to the depth of near three hundred feet, in many places affording room for only one person to proceed. Here we found a beautiful stream of pure water, winding its way along between the rocks. The situation of this part of the cavern is rendered really awful, from its being associated with a variety of names that travellers have given it. The portrait of his satanic majesty is painted here upon the rock, and a large flat stone, resting its corners upon four others, is called his dining-table. A short distance from this is a place said to be his forging shop. On the whole, they are admirably calculated to frighten the cowardly. We return to the main cavern, and resume our course, climbing over rocks that had evidently fallen from above, and passing a number of rooms on our right and left. With much exertion we reached the place denominated the "six corners," in consequence of six rooms or caverns here taking different directions. Not having time to examine these, we proceeded to the first waterfall, about two miles farther, over a level plain. The track of persons who might have preceded us for ages, was as plainly visible in the sand as when first made. There is no air stirring that would move the slightest feather, or prevent the impression of a footstep from remaining for centuries.

We now directed our course to the chief city, about one mile farther. A large hill, situated in the centre of the cave, would have exhibited a most commanding prospect, if the darkness had not obstructed our vision. One of us, however, standing upon the top, with a light stationed at different parts of its base, obtained a novel and interesting view of the cavern. There is an echo here that is very powerful, and we improved it with a song, much to our gratification. We started forward again, travelling over a plain of two miles extent, and about the same distance over the rocks and hills, when we arrived at the second waterfall. The water here dashed into a pit below of immense depth. A circumstance occurred here that had nearly proved fatal to one of us. The sides of the pit are formed of loose rocks, and we amused ourselves by rolling them down, in order to hear them strike the bottom. Such is the depth of it, that a minute elapsed before we could hear them strike, and the sound but very faint. One of our party venturing too near, for the purpose of rolling a stone, started the foundation on which he stood, and was precipitated down about twenty feet, with the tumbling stones; but fortunately a projecting rock saved him from destruction. This put an end to all our amusements; and being much fatigued with a travel of twenty-four hours on foot, and seeing no fairer prospects of finding the end than when we commenced, we concluded to return. We accordingly took up our line of march, returning the way we came. After being forty-two hours absent from the light of day, we again found ourselves at the mouth of the cavern, and gave ourselves up to a refreshing sleep.

There are a number of pits of great depth, in different parts of the cave, which make it necessary to be very careful in exploring it. There is danger also of taking some unexplored room, and becoming so lost as not to be able to find the way out. This is, however, obviated by the precaution that has been taken, as far as has been explored, to place the figure of an arrow at the entrance of every room, pointing to the mouth of the cave. Care should always be taken to preserve the lights, as it would be impossible for any one to find the way back in darkness, farther than the first hopper. We found the names of ladies inscribed at the farthest points we reached; and our guide remarked that they were the most courageous visitors he had. For three miles from the mouth, the sides and top of the cavern are covered with a remarkable quantity of bats, hanging down from the top in the form of bee-hives, from two to three feet thick. They are in a torpid state, and are seldom known to fly. There are about twenty different rooms that have been discovered, and but three of them that have been explored to the end. This vast cavern is apparently hollow beneath, from the sound that is made by walking through many of the rooms. It would probably take months to explore to the end of all the rooms that have been, and which remain to be discovered. The moving of some few obstructions, at a trifling expense, and lighting of the cavern, would enable a stage to go with safety to the second waterfall, a distance of fifteen miles.*

* Abridged from a letter written by a correspondent of the New England Review.

The present number of the Journal completes a quarter, for which payment was generally received from subscribers in town: the Publishers respectfully notify, that, in the course of the ensuing week, receipts for the next quarterly payment will be sent to the houses of the subscribers, and that it would be conferring a particular favour, and save much trouble, if payment were made when called for. It would, perhaps, be most convenient for both parties, in order to prevent the possible necessity of a second application, that the subscribers (if they wish to continue the Journal) should leave the small sum required with their servants.

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, John Macleod, 20, Argyle Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

MAKERS AND SPENDERS.

(Second Article.)

NOTHING can be more obvious than the revolutions which take place in the fortunes of families with almost every new generation. Our predecessors used to express this in a proverbial way, as follows:—

The grandsire buys: the father bigs:*
The son sells, and the grandson thigs.†

That is, fortune is acquired by one generation, used and enjoyed by a second, and squandered by a third, whose posterity become beggars. The general case is more exactly this: the child of a poor man works hard, and obtains wealth; the sons of this person, gifted with fortune of which they do not know the value, throw it to the winds, and leave their children destitute; these children, however, knowing what poverty is, are careful, industrious, and successful, like their grandfather, and leave wealth to be again dissipated, as his was. The one generation, in short, gains what it does not spend; the other spends what it does not gain. Hardly any man has both the gaining and spending of his money—unless, indeed, he be one of those philosophers who judiciously contrive to be always, as the saying is, between the hand and the mouth, and thus defraud of all possible advantage, both contemporaries and posterity, superiors, inferiors, and equals.

All the real good that is done in the world, is done by a limited number of persons. Some from their very childhood are marked out as individuals who will fully discharge every obligation of nature—work hard for their own bread, sustain those who have claims of affection upon them, and, after an useful and beneficial life, find themselves with a surplus for endowing their children. Others are destined from the very womb to be a trouble to all around them—to work hardly any, or to no good purpose; to bring children into the world whom others have to support; to be always, in fact, in the way of taking, and spoiling, and *sorning*, without ever making a single fellow-being the better of them—something like those children of charity described in works on the English poor-laws, who are ushered into existence by a midwife paid by the parish, nursed by a parish nurse, educated at a free school, apprenticed and supported all through by the parish, and finally buried at the expense of the same overladen establishment. Just here and there in the waste of men, we see a goodly, honest, and painstaking person keeping up a decent house above his head, and paying scot and lot, as the saying is, with something perhaps to spare; while all around him hang numerous individuals, related and unrelated, who supply their own deficiencies from his store, and enjoy all the advantages of industry, or perhaps more, with nothing of its toils. If a man be tolerably poor, he is permitted to lead a truly happy and independent life; but no sooner is it known of one that *he has any thing*, than whole legions of people come flocking about him to ravish away a share of it, and he is pestered out of his very life till they have got him once more equalised in every respect with themselves. A chicken which has just scraped up a rather larger worm than usual, is the aptest emblem in nature of a man so situated. Off she flies with the precious morsel hanging in her mouth. Off fly the rest of the brood after her, clamouring and pecking for a bit of it. In vain does she represent to them (for no doubt she does so) that the worm was the captive of her own bow and spear—that they may seek for another, and she won't interfere with them in eating it. No, no; nothing will do but a fair division of the spoil. Down at last goes the insect upon the ground, where it is immediately torn and gobbled in very unequal portions by her companions; and happy is she, if, in the long-run, she gets even a fair share of what unquestionably was altogether her own property.

So long as a man stands single in the world, or has none but infant children to attend to, he runs little risk of being altogether ruined by means not his own. The grand danger in the life of a respectable married member of society arises at the time when his children become men and women. We shall suppose a man who has been entirely the architect of his own fortune; a meritorious tradesman, who at first had to struggle with all the mishaps described in the preceding article—a victim father, a family not his own to be supported, and his capital for business all to be formed by his own labour. Suppose that this person, by singular perseverance, virtue, and ability, has overcome all his early troubles, and found himself at last able, without imprudence, to undertake the charge of a family of his own. In all probability, before his children grow up, he has been able to assume a style of life, which, though not ostentatious, comprises as much luxury and comfort as he may well be considered entitled to, after so laborious a life. Whatever be his mode of living, it is supported entirely by his own gains; and no one, therefore, can justly challenge it. It turns out, however, that the very ease in which this deserving man now lives, is apt to be exceedingly detrimental to his children. They have never known what want was. They calculate perhaps upon being set forward so well in the world, that very little exertion on their part may be necessary. It is at least apparent that the distressing circumstances which were a stimulus to their father in early life, are completely wanting to them; and as the circumstances are contrary, so is the result apt to be. The father was urged by a desire of living as he now lives; but the sons, who already live in this manner, have no such motive. It matters not that, so far as the young people are concerned, it is not a life that can last: the early usage is the thing which operates. In all entrances into life there are great initiatory difficulties: if a boy become an apprentice to a trade, he has to encounter much drudgery at first, and perhaps many real hardships; if he be destined for what is called a profession, the first steps are not in the least more easy. Now, the mischief lies in the disgust which a young person who has been brought up with all appliances and services, must feel on entering a course of life where the usage is so different and the labour so great. Lads who have mingled with genteel company, whether at their mother's tea-drinkings, or in scenes less innocent, cannot be seen going about as errand-boys, or doing any of those other acts of drudgery which are required on entering a business of the same order with that practised by their father. Such trades, therefore, are left to boys from the country, who have no acquaintances in whose eyes they may be degraded, or to the children of poorer persons than their own fathers. Now, it might be all very well that the young men are thus inclined, when the father is really possessed of fortune, and can give them the desired promotion in life. The cases, however, of which we speak, are those in which the father can only live respectably, and has little or no command of spare money. In such a case, the affluence is just enough to do evil, without going far enough to do good. It would almost appear, that, unless a man could feign poverty, and absolutely abstain from enjoying the fruits of his own industry, he can hardly save his children from this misfortune, or himself from the evils likely to arise from it.

It is not to be denied that many sons manifest superior application and talent to what has been shown by fathers of this kind, and, taking up the family prosperity at the point where their predecessors have dropped it, do not rest till they have carried it many degrees onward. Few instances, however, are found of prosperity in a *third* generation: Nature, which evidently never contemplated entails, seems to decree otherwise, in order that the good things of the world may not be monopolised by any peculiar race of men. At the hazard of being thought paradoxical, we would assign one generation as the more ordinary limit of prosperity, and lay it down as the most hopeful sign of any young man that his father was poor and his education hardy, while nothing, we would say, can look so ill for such an individual, as that he was brought up in perfect comfort, and had a patrimony to look forward to. We remember an honest country lad who used occasionally to cut the hair of his younger brothers, or of any other companion who chose, by submitting to him, to save the trifle generally given to the professed village barber. Some one once rallied this amateur tonsor on the inequalities which his scissors left behind them; to which he, with equal philosophy and good humour, replied, "Never mind—there's just a fortnight between a well-cut head and an ill one;" a remark which applies amazingly to the subject now in hand. The difference, evidently, between entering the world with and without capital, even where it is used in the former case with tolerable prudence, is purely a matter of time. A few years generally make them nearly alike.

How far good training may be effectual in averting the calamity of an untoward family, we will not pretend to say. From the frequent instances, however, of the best of fathers having the worst of sons, we are disposed to fear that it has no sure effect. The female parent is often blameable for the indulgence with which she treats a wayward child, to the counteraction of better processes instituted by the father. Nothing will tire a mother's love for her *sons*: and it would almost appear that their very worthlessness, when such is their character, only endears them to her the more, by reason that it sets her to work in forming hopes of their amendment—hopes so brilliant, that they exceed greatly the sober estimation she may entertain for the actual ready-money goodness of the rest. But it is needless to inquire into causes: the fact is apparent, that innumerable children, with every thing that is vulgarly supposed an advantage to aid their entrance into life, either shy at the starting, or soon founder and go off the course; and that many a deserving man, after a long life of severe toil, and when expecting to enjoy thenceforward the sweets of competency and leisure, finds that he is beginning the world once more in a number of dispersed existences, each of which is freighted with a part of his gains, and a part of his honour, and a part of his whole heart and soul, all of which in many cases are shipwrecked and lost—so that the real dangers and disasters of life are only *now* commencing. Just in proportion to the number of his children, is the number of his hazards; and though he generally finds comfort in some, he is more fortunate than nine-tenths of his fellow-men, if there be not one, or perhaps two, or even more, who tear for years at his own vitals and those of their more industrious brethren, nor rest till either the one party or the other has hidden its ignominy in the grave.

It is difficult, no doubt, to argue against any principle that may be considered as identified with human nature. Yet speculative thinkers may justly question the propriety of all this toil and self-denial for the sake

* Builds.

† This word expresses the condition of genteel mendicancy.

of our successors, when it is shown that, so far from doing them a certain good, it is almost sure to do them harm. It will never be disputed that every man ought to put himself, if possible, into the condition of being able to give his children a fair chance in the world, among the average of his companions in the same rank of life. It is altogether questionable, however, if any thing more than this is either demanded by the laws of affection, or in any respect salutary or just. Abstractly, it is only ridiculous that one generation should in all cases, if possible, supply the enjoyments of another, and have none to itself. Why, then, may we not see the absurdity of the particular case, when it comes to be our own matter? Surely it were far better that men in general took more enjoyment out of their own gains than they do; leaving to their successors a fair proportion of the difficulties of entering into life, that they may be the more able to endure its eventual burdens, and be the more regaled when they come to taste the sweets of well-directed exertion.

POPULAR INFORMATION ON ROMAN LITERATURE.

LIVY—TACITUS.

Titus Livius, whom we call Livy, was born at Patavium, the modern Padua, in the year 59 before Christ. Although his works have immortalised his name, he was too regardless of popular applause, or places of distinction, and too much delighted with philosophical retirement and humble privacy, to leave many vestiges of his rank, employments, adventures, or fortune; so that his life, like that of most other learned men, furnishes little for biographical narrative. He appears, however, to have been descended from a family of some celebrity, since it is known to have had the honour to give consuls to the republic of Rome. Having formed the design of his Roman history, he removed to Rome, where he might have recourse to such memorials and original papers, that had been preserved in the capitol, as were proper to ensure his accuracy concerning the origin of the city, and to remove those intricacies and doubts in which fabulous traditions had involved it. After he was sufficiently master of his subject, he retired to Naples, where his labours might meet with fewer interruptions. These were evidently the inducements which drew Livy from his native city to the capital, for it does not appear that he either liked the bustle of the city, or had the smallest wish for political preferment. History does not inform us in what year he removed to Rome, how long he continued there, or when he fixed his residence at Naples. It is said that he dedicated to Augustus certain Dialogues, which he published on the philosophical questions of the times, and that this made him known, and recommended him to the favour of the emperor. He afterwards wrote a Treatise on Eloquence, inscribed to his son, of which Quinctilian makes honourable mention. Some time after this, he read some passages of his history to the emperor and Mæcenas, of which they formed so favourable an opinion, that Augustus appointed him preceptor to his grandson Claudius, afterwards emperor. Had ambition influenced his conduct, he might have improved his connection with the emperor, afforded by this appointment, to the furtherance of such desires; but absorbed, it appears, in his great undertaking, the History of Rome, his mind would soon revolt at the drudgery of teaching, and he sought the delight of tranquillity in the town, or vicinity, of Naples. Here he enjoyed undisturbed ease and quiet, continued his labours, and finished his work, consisting of one hundred and forty-two books, commencing with the arrival of Æneas in Italy, and ending with the death of Drusus, in the year 10 before Christ. After the death of Augustus, and the completion of his arduous undertaking, he returned to his native Padua, where he was received by his fellow-citizens with every demonstration of joy and mark of honour. He died there at the age of 76, in the fourth year of Tiberius, and seventeenth of the Christian era. Besides his son already mentioned, he had a daughter married to Lucius Magius; but whether they outlived or predeceased their father, or whether he had more than these two children, we have no means of ascertaining.

Of the hundred and forty-two books of which Livy's Roman History originally consisted, one hundred and seven have unfortunately been lost; so that thirty-five only have been transmitted to modern times, and of these some are also imperfect. We have entire the first ten books, and from the twenty-first to the forty-fifth inclusive. A few fragments of the last books, as also a summary, or contents of the whole, entire, either from the pen of Livy himself, or from that of Florus, another Roman historian, has come down to us. These summaries, while they furnish some important facts, excite deep regret at the irretrievable loss of so great and interesting a portion of this valuable work. The first ten books contain a rapid sketch of occurrences from the foundation of Rome, till 461 before Christ. In this portion we find a number of curious statements, written with great elegance and liveliness of style. Of the records to which Livy had access, and of the traditionary narrations, he made the very best use; yet candour must acknowledge that these pages contain much that is uncertain, much that is marvellous, and much that is fictitious. The next ten books contained, among other occurrences, the first Punic war, and comprised a period of seventy-five years. The second Punic war occupies the greater part of the next ten books, and, from the minuteness of the details, embraces only a period of sixteen years. The next ten, or fourth decade, record the wars with Philip, king of Macedonia, and Antiochus, king of Syria, comprising a space of twenty-three years. Of the fifth decade, only the first five remain, and these imperfect. They give, however, an account of two important wars, one with Perseus, king of Macedonia, who, after gaining many advantages over the Romans, was at last conquered, and his kingdom reduced to the form of a Roman province; the other with the Carthaginians, commonly called the third Punic war, which continued only for five years, and ended with Carthage being levelled with the ground.*

Every page of this author's writings, which time has destroyed, the literary world have agreed in regretting as a general loss. The value in which they have been held may be estimated from the expectations which have been formed, the searches that have been made, and the rewards that have been proposed, for recovering all the books of this inimitable historian which are wanted in our printed copies.

Livy saw and spoke of the Romans when they were at the height of their prosperity, and in the zenith of their power; but at the time when our next historian, Tacitus, wrote, luxury, and other causes of declension, had begun to operate towards their downfall.

Caius Cornelius Tacitus, who holds deservedly the second rank as a Roman historian and orator, was born about the year 57 of the Christian era. Ancient authors neither mention the names of his parents, their rank, nor the place of his birth; but it is thought that his father was procurator of Belgic Gaul, and must, consequently, have been a person possessed of equestrian dignity. There has been no information handed down regarding the place or the nature of his education; but oratory seems first to have engaged his attention, for the bar and the army were the only avenues by which a Roman could reach the honours of the state. In this pursuit Tacitus acquired so much celebrity, that the famous general Agricola chose him for his son-in-law when only twenty years of age, and he then appeared as a candidate for the honours of civil preferment. During the turbulent times of Galba, Otho, and Vitellius, his conduct appears to have been marked by the strictest integrity, and by assiduity in his studies. The emperor Vespasian laid the foundation of his fortune; and under Titus, the son and successor of that prince, he obtained the office of Quæstor, which gave him a seat in the senate. The wicked Domitian, the brother and successor of Titus, bestowed some favours upon our author, who seems to have conducted himself with the same prudence, moderation, and caution, which he has commended so much in the conduct of his father-in-law. In the year 88, Tacitus was a member of the Quindecimviral College, and held the office of Prætor. Next year, he and his wife left Rome, and did not return for upwards of four years, during which time he is supposed to have had the government of a province committed to him by the emperor; and on the eve of his return, he received the mournful tidings of the death of his father-in-law Agricola, who died in September 93, not without strong suspicion of his having been poisoned by orders of Domitian, who was jealous of his great reputation.

On his return to Rome, Tacitus delivered a funeral oration in honour of the consul Virginius, and held the office of consul for the remainder of that year. An intimate friendship subsisted between Tacitus and the younger Pliny, founded on similarity of studies and virtues. They both detested the tyranny of Domitian, and both wished to give perpetuity to merit, by contrasting it with the vices of former or subsequent reigns. Of this, Pliny has given a beautiful specimen in his Panegyric on Trajan, and Tacitus in the whole of his history. In the prosecution of Marius Priscus, proconsul of Africa, Tacitus and Pliny pleaded the cause of the injured Africans, and the senate, after three days' deliberation, sentenced Priscus to pay back the amount of the bribes which he had received, and to be banished from Italy. The emperor Trajan presided at that trial, which happened in the year 100; and it does not appear that Tacitus afterwards gave any part of his time to the labours of the bar. During the reign of Trajan, he published his *History*, which comprised a period of twenty-seven years, beginning with the accession of Galba, in the year 69, and ending at the death of Domitian, in the year 96. Of this valuable work only four books and the beginning of the fifth remain. Vossius says, that it consisted of thirty books, and it will be readily allowed that the literary world has sustained a great loss by only so small a portion being transmitted to modern times. Encouraged by the high approbation of his countrymen, he selected another period of Roman history, in order to hold up to the detestation of succeeding ages the tyranny of Tiberius, Caligula, Claudius, and Nero, which includes a space of fifty-four years, beginning with the year 15, and ending with the year 68. The style of this work, which he denominates *Annals*, differs considerably from that of the *History*. In the latter, Tacitus has, with greater labour, rounded his periods, and used more pompous and dignified expression. In the former, the style is simple, the words few, and the narrative rapid. He seizes on the principal characteristics, and the language conveys as it were but an outline of his meaning. In no Roman author do words convey so much beyond their ordinary signification, as in the *Annals* of Tacitus. Here, as well as in the *History*, the learned reader bewails the ravages of time. Part of the fifth book, which contained three years of the reign of Tiberius, the whole reign of Caligula, the first six years of the reign of Claudius, and the last two of Nero, perished during the barbarous ages.

Besides the *History* and *Annals*, Tacitus wrote the life of his father-in-law, Agricola, who subdued Britain, and was the first who sailed round it so far as to ascertain it to be an island. He wrote also a Treatise on the Manners of the Germans, and a Dialogue on Oratory. Had he lived, he intended to have reviewed the reign of Augustus, a work which he probably never wholly executed. The time of his death is not ascertained, but it took place, most likely, in the reign of Trajan. The same uncertainty prevails respecting the place where he died, and the spot which contained his ashes. His writings, however, constitute the best monument, and a genius like that of Tacitus stood in no need of sepulchral ornaments. His thorough knowledge of government, his admirable powers of description, and his penetrating judgment, fitted him for historical composition in an eminent degree. He considered it his duty to judge the actions of men, on purpose that the worthy might meet with a reward due to their virtue, and the wicked be deterred by the condemnation which awaits evil actions at the tribunal of posterity. This moral principle directed his pen throughout the whole of his works. His rich and varied eloquence enlivens his forcible description in such a manner, that the reader feels himself a witness of the events described, rather than a listener to the narrative of the historian.

It would be difficult to name an author to whom the Romans owed greater obligations than to Tacitus; yet his political sagacity has failed him remarkably in one opinion, where he declares, that a government in which the three orders, the people, the nobles, and the king, have each a share in the authority, could never in fact exist; or, if it did, could only be of short duration. In one instance, also, namely, when speaking of the Jews, national prejudice, added, perhaps, to inaccurate information, has made him misrepresent the origin, history, and character of that very remarkable people.

It is uncertain whether Tacitus left any family behind him. The only evidence in support of his having had children is, that Marcus Claudius Tacitus, who ascended the imperial throne in the year 273, derived his pedigree from our historian. Vanity may have led to this genealogy, since nearly two hundred years had elapsed from the time of the historian's death, and, unless his descendants had been considerable for rank, it would have been impossible to trace the connection.

STORY OF WALTER STUBBS.

THE DEAD-LETTER BOX.—NO. III.

On again visiting my friend Graham, I proposed to have another search in his dead-letter box; to which he, though taking less interest in the matter than I did, readily gave his assent. Of the letters, one which I had had in my hand on the former occasion again attracted my attention, and I presented it to Graham, inquiring if he knew any thing of the owner. It was addressed "Robert Ducie, Esq. —— Regt." "Know him!" said Graham, "I know him perfectly; he is alive, and well: how could such a letter get in here? Ah! Ducie was away on furlough at the Cape for some time, and there was a report that he was dead. Serjeant White, my clerk, must have thrown it in at that time. But we must have the mistake rectified as soon as possible, for Ducie, though a good soldier enough, is not a person I should like to owe any obligations to. Will you accompany me to his bungalow, to deliver the letter?" I was of course quite ready to go; and as the distance was short, we did not take our palanquins. We had to pass over a narrow causeway which connected two islands in the bay, and where the tide came lashing to our feet on either side as we walked, threatening apparently to swallow up the narrow thread of pathway which gave us passage between its surges. The waves, however, had spent their force on the rocks and shallow beach long before they reached the causeway, which consequently never suffered, except in storms or very high tides. On arriving at the opposite side, Graham pointed out Captain Ducie's bungalow, not enveloped, like his own, in a group of palms, but shaded by two or three of the low wide-

spreading Indian bread-fruit trees, whose immense pumpkin-like fruit, hanging among its branches, presents such a singular object to European visitants. Ducie was sitting reading on a camp-stool below one of them, and appeared to be a slight dark-complexioned man, of slow precise manners, and formal speech, with a watchful reserved look, as unlike the frankness of a soldier as any thing that could be imagined. After introducing me as his friend, Graham mentioned the mistake which had occurred: "I believe," said he, "it was owing to the illness of Serjeant White, my clerk, who was for a while unable to attend regularly during the time that you were on furlough."

"No doubt of it: that must have been the reason of an oversight so unlike you, Lieutenant Graham," said Mr Ducie, accepting the apology with the air of a person who did not give up the idea that there was blame somewhere else. "But this is a singular communication which I have received," said he, after perusing the letter; "and I should rather wish that in the steps which I must take with regard to it, I should have the benefit of your assistance, Adjutant Graham." Adjutant Graham did not appear to be much flattered with the confidence of our host; but as it seemed to be rather imposed on his official character than offered on personal grounds, he bowed gravely, and said he would be glad if he could be of any service. Mr Ducie then continued: "That you may understand the circumstances, I beg to mention that about eighteen months ago, a communication was sent me by a relation, inquiring concerning an old man of the name of Stubbs—Walter Stubbs—said to reside on this island, and who was supposed to be rightful heir to a considerable landed property in England. My relation—a Mr Semple—is himself connected through his wife with the same property, which I believe falls to his family in default of Stubbs and his issue. Having been able, after a great deal of research, to trace the supposed heir to India, where he lost all clue to his farther motions, he applied to me as being on the spot; the man luckily had not changed his name, so that I was soon enabled to find him, and make the necessary perquisitions. I wrote to Mr Semple in consequence, and this is his answer."

"Stubbs?" said Graham; "is not that one of the old pensioners who reside among the native black people in the village of Colabah?"

"He does reside there, Mr Graham," answered Ducie.

"If your friend is only to succeed in default of his issue, he will make but little of his inheritance, I am afraid; for Stubbs has as flourishing a warren of black children as ever I saw."

Mr Ducie answered by a grim smile, which seemed to hold the claims of Stubbs's progeny very light; and I had frequently heard that the children of an Englishman by a native female could not succeed to British property, except by some special provision.

"That is not our concern, Mr Graham," said Ducie; "but I informed Mr Semple of the circumstance. This is his letter." I happened to be next Mr Ducie, so that the communication came into my hands, the owner retaining one or two enclosures, which I should have liked much to see also; for it was evident there were considerable inducements to prevent the old soldier and his Indian family from getting fair play. The letter was as follows:—

"My Dear Ducie—I received yours, and am much gratified that you have been able to discover the heir. It was the luckiest chance my getting a hint of his being in India; but had you not been on the spot, we could never have succeeded. You cannot imagine how many false claims had to be encountered, and how much riding and running to parish registers and tombstones I have had, before we could establish the right of Stubbs to the property. The landed estate is reckoned to be worth L.800 per annum, so that the old pensioner will be quite lifted off his feet. As for Mrs Semple's claim, it falls to the ground if Stubbs has any children who can inherit. You can call upon the old man, and consult with him on the steps necessary for putting him in possession, or for bringing him to Europe, if he wishes it, which I should think unlikely, as he has no friends here, and his conduct in early life, as far as I can learn, was odd enough. All the necessary documents are forwarded to the house of Jervas and Company, where they will be kept till you call for them. I thought it better to send them in that way, than through the post-office.

"Stubbs left this country before you or I were born; but I have often heard my father-in-law speak of him as a wild headstrong youth, who added to the misfortunes in which his family involved itself, by their long and obstinate lawsuit with Mrs Semple's friends. There was a story about his being attached to a young woman, one of our relations, whom the family were forced to disown. She is long since dead: but these are all matters of a very remote date.

"I shall be glad to hear from you as soon as the necessary steps can be taken.—I am yours, &c.

"D. Semple."

"Why, this is better than any eastern romance of them all," said Graham, forgetting the formality of the visit in his interest in the story of the heir. "I have seen the old man over and again, sitting under a tree in the little bazaar, talking with a group of the natives: he speaks all their languages; and with his blue muslin jacket, straw hat, and Russia leather complexion, he looks as much Indian, or at least as little English, as any Brahmin among them. To think of such an old rajahpoot becoming a gentleman of L.800 a-year in England, and handing the estate down to his black-and-white progeny, is capital."

Ducie gave a kind of sarcastic laugh, while he said, "If they are entitled to it, why not, Mr Graham?—the old man will be glad to see it so distributed, I have no doubt."

There appeared to me to be very little sincerity in Mr Ducie's acquiescence, and even his friend's letter, which I had read (I was sure he had some private communication besides), seemed a document written for the purpose of being shown about, in order at once to throw a tinge of discredit on the heir, and to make out a claim of disinterestedness on the part of his agents. I was rather confirmed in this view by Mr Ducie ostentatiously requesting Mr Graham and myself to accompany him while he delivered a letter, which was enclosed, to Stubbs. We accepted the invitation, and set out immediately after taking tea.

Our road led us to return over the same causeway by which we had come; after which, on entering the other island, we came upon a pretty large open space, surrounded by cocoa-nut and other trees, except at one corner, where the village was situated. It was bright moonlight, and I saw that the houses of this Indian town, among which we soon found ourselves entangled, were all of them little low sheds, with their walls made of twigs, warped on wooden framework, and plastered with mud; they were roofed with palm-branches and leaves, and few of them appeared to be more than six or seven feet high. We passed through a narrow lane of such edifices, where hardly any body was to be seen but here and there a little black naked child, which watched our approach with its two bright eyes, peeping from behind a corner till we came near, when it vanished into the shade. The lane, after turning to the right, conducted us at last to an open space which surrounded a little mosque or temple (I could not tell which), whose white walls glittered in the moonlight, and contrasted strangely with the multitude of little dark huts by which it was surrounded. In the corner of the area, opposite to that where we entered, were two or three trees clustering together, while beneath these we could observe, by their white dresses, several of the Hindoo inhabitants seated on a turf bench, to enjoy the coolness of the moonlight evening, which is so delightful in these hot climates. On coming up, Mr Graham, observing one of the people who wore a hat, and not a turban like the others, said to him in English, "Can you show us the house of Walter Stubbs, hereabouts?"

"I am Walter Stubbs, sir," said the man, coming at the same time out into the full moonlight, and touching his hat respectfully. He was a person evidently advanced in years, of middle size, with a complexion very much tanned by the climate, but still of hale and firm appearance. As we stood, the stout old man looked at us with a kind of quiet scrutiny, as if waiting to learn what business we could have with one who had now little to do with English people or their concerns; while I could not but wonder at the chance which was apparently to introduce such a person, as it were, into a new scene of existence.

"Oh, is it you, serjeant—Mr Stubbs?" said Ducie, in a tone where the habits of military authority (for which he was a great stickler) struggled oddly with his evident wish to conciliate the heir of L.800 a-year. "I have been looking for you, in order to inform you that a letter has been at last received, in regard to the affair which I mentioned slightly to you about eighteen months ago."

"That is concerning the property, sir; is it?"

"It is, Stubbs—Mr Stubbs. I have this evening, after some delay, received a letter from my friend Mr Semple, informing me that your right is ascertained beyond a doubt, and that there is nothing to prevent your entering upon possession."

"I am greatly obliged to you, sir. I am old, but it will be of advantage to my family."

Ducie gave a kind of cough, but immediately said, "This letter from Mr Semple to you will state the particulars as far as it is necessary for you to know them at present."

"Will some of you gentlemen read it for me?" said Stubbs; "my old eyes will not serve me without glasses, which I have left at home."

The letter was accordingly given to me to read; it was very short, and ran as follows:—

"Mr Stubbs—Sir, By the assistance of my friend Mr Ducie, I have been able to trace your title to the property at Westham, and to satisfy myself that it descends to your family, provided your wife be a European woman. All the documents are lodged with Jervas and Company, from whom you will receive them in presence of Mr Ducie. I believe you are aware that, failing you and your heirs, the property falls to my wife as the next relation. I am, &c.

"David Semple."

I observed the old man cast a sharp glance on our companion at mention of the clause which excluded his family; and, on handing him the letter, I said, "It is a pity that your children cannot succeed. Perhaps Mr Semple may be mistaken."

"He will take care there be no mistake on that subject," said Stubbs, with a bitter smile.

"I had understood that your wife was of Christian parentage at least," said Mr Ducie, in an insinuating manner; "in which case there might be some chance of a different interpretation."

"She was born in Poonah, sir, of Mahommedan parents," said Stubbs, abruptly.

Ducie only answered by a stare, and then said, "You will meet us at the colonel's to-morrow morning, Mr Stubbs, where I shall have the packet in readiness, which is now lying with Mr Jervas: you can have some witness there on your part, who is able to write."

"I shall bring White, sir, the adjutant's clerk."

"What! is that the fellow whose carelessness delayed the letter?" asked Mr Ducie.

"I assure you," said Mr Graham, "that White, for the few years he has been in the country, has shown himself both a good clerk and a good soldier; the mistake about your letter must have occurred when he was absent from illness."

"Well, well," said the other, "Mr Stubbs may bring any confidant he pleases: I shall be there with the packet. Will you go now, gentlemen?"

We had proceeded a few steps on our return, when we heard Stubbs calling on Mr Graham, "Adjutant—adjutant;" and my friend, seeing that the old man would not be able to overtake us, stopped to wait for him. I remained also, Mr Ducie being obliged to proceed to the military barracks on some point of duty.

When Stubbs came up, he said to Graham, whom he seemed to consider as a friend, "this Mr Ducie and his relation are seeking to make a handle of my claims, in order to forward their own; and I suspect they would have contrived to do without me altogether, had they thought my family could succeed. Did they say any thing of a young woman who should have been heir before either them or me?"

Graham hesitated a little—"They said something about a young person to whom you were engaged in early life, Mr Stubbs, but who is since dead."

"To whom I was engaged, and who is since dead!" said the old man, speaking with a low deep voice, and evidently agitated with strong feeling. "They would say no more, I doubt not. Her name was Agnes Rugley, and they and their friends killed her and ruined me. This property, gentlemen, has been the occasion of some unhappy events—God grant that they may be ended."

There was a pause, neither of us knowing what to reply to observations so unexpected. Mr Graham at last said, "Then you knew of your connection with the property before?"

"Knew of it!" said he, shaking his head, "I knew of it too well. Did not a lawsuit, in which it involved us with these Ducies and Semples, cause the death both of my father and uncle, and of my cousin—my poor—I mean of this Agnes Rugley?" said he, checking himself in something which he would have said. "But what I have to ask of you, sir (addressing Graham), is to request that you would permit your clerk, Serjeant White, to be present to-morrow at the reading of these papers at the colonel's."

"Surely; White is a most deserving lad, and you could not give your confidence to a better."

"Thank you, sir—thank you," said Stubbs, touching his hat, and walking away.

We stood looking after him for a moment, and when we at last turned to go home, Mr Graham said, "this is a strange story, if one can believe what Stubbs says; he was always reckoned a steady old fellow, and performed some singular exploits when he was in service: the colonel has the greatest respect for him. There must have been some foul play of old, both towards him and this young woman whom he speaks of, and I am sure Ducie knows of it all. It will be a pity if they can keep his children out of the inheritance."

"I believe it is quite in their power," I replied; "the children of a woman of this country cannot inherit, if the next heirs insist on excluding her."

"They will do it then, you may depend, and I am sorry for it; for Stubbs has been at more pains with the education of his children than most others in his situation. He is a sensible old fellow. But you will meet me to-morrow at the colonel's; you are sufficiently acquainted with him."

I promised, and we parted accordingly.

I was rather late at my appointment, and found all the other parties present. They had finished reading some papers by which old Colonel Griffiths appeared greatly interested, and he was asking Stubbs some questions about them as I entered, which White, the adjutant's clerk, a good-looking young soldier, was writing down.

"My family cannot inherit the property, then?" said Stubbs.

"If the next heir chooses to insist on the circumstance of their mother not being a British subject," said the colonel, "he can undoubtedly prevent them from succeeding. The question is, will he take advantage of that point?"

"I am instructed that they cannot succeed," said Ducie.

Stubbs cast on the speaker a look of scorn in reply to this remark, and said, "your friends expect to reap the benefit, I suppose; but if Agnes Rugley had been my wife, her children could have inherited, could not they?"

Ducie coloured deeply, but merely said, "I suppose so—I know nothing of Agnes Rugley."

"Ahem! will you look at that, sir?" said Stubbs, handing to the colonel a paper which he took from a beautiful little Chinese card-box.

"This," said the old colonel, "is an attestation of

marriage between Walter Stubbs and Agnes Rugley, spinster."

"And this," said Stubbs, taking another paper from the box.

"It is," said the colonel, "an extract of the records of baptism of Robert Stubbs, son of the before-mentioned Agnes and Walter."

"Yes," said Stubbs, "I have lived to see the end of a train of machinations which ruined my father and his family when I was a lad, and which crushed to the earth a woman who deserved my dearest love. She died; and I was driven to India, where I have spent the prime and strength of my life as a common soldier."

"You were ever an honour to your regiment, Mr Stubbs," said the colonel; "and many a time I have been proud of your gallant conduct. But this paper intimates that you had a son in Europe?"

"He is here, sir. Serjeant White is my son, and the son of Agnes Rugley. He was bred up by a friend of his father and mother, and came to India to share my fortunes."

All eyes were turned on the young man, and certainly a more graceful figure, now that he stood as the heir of a fortune, never appeared. Colonel Griffiths took him by the hand, and said, "I am glad, young man, that my gallant old friend, Mr Stubbs, has a son who is worthy of him. He and I have long been fellow-soldiers, and whatever I can do for you or him, you may command." The young man bowed gratefully.

Mr Ducie departed in a few minutes, and Graham and I also took our leave, Graham saying as we went out, "the colonel will be glad to be left alone to hear the whole story from the old man. Stubbs and he came to India about the same time, and have lived together through battles and fevers innumerable. The rights of the heir are in much better hands now than our friend Ducie's."

A COLUMN ON THE FINE ARTS.

THE hackneyed phrase, that there is no disputing on subjects of taste, seems to imply that every description of whimsicality or prejudice may be defended, or that it is useless to contend against them. The term taste being undefined, or not being referable to any particular standard, has rendered it subject to vague interpretations; nevertheless, we all agree that it is a qualification which enables us, amongst variety, to select the most graceful or beautiful, and that it is most desirable when investigating subjects connected with the fine arts. Impressions may be variously produced on the mind, and gratification may be derived from numerous sources, but it has never been contended, that, when the objects of our pleasure have been trifling or vulgar, the indulgence was favourable to taste; whereas, if the source of our pleasures be refined, there can be no hesitation in applying the term tasteful to our gratifications.

It may be assumed that we naturally possess a disposition to admire pictorial representations. There is not a cottage, where its inmates can afford the expenditure, in which we do not see some effort of art decorating the whitewashed walls. Examine this propensity through the ascending gradations of society—the merchant's villa with its display of cabinet pictures—the splendid gallery of paintings in the nobleman's mansion—and the magnificent collections from the highest schools of art in the royal palaces. If all this do not arise from a love of the arts, to what shall we attribute a propensity so general?

All persons are not equally enabled to judge of correctness of form and beauty of colouring; but, under similar circumstances of education and disposition to cultivate tasteful pursuits, it is reasonable to conclude they would be so, and the same general standard of correctness would be universally acknowledged. The ability to distinguish between the ordinary and the beautiful, may not require an exertion of critical acumen; but, amid the variety of forms and hues that nature presents to our view, to determine which is most appropriate to some particular purpose, or most proper to be selected in unison with others, demands an intimacy with forms and colours as extensive as their combinations may be intricate. Accordingly, we find those who possess those discriminations do not wander in uncertainty as to the effect produced by those combinations of form or colour—their mode of arrangement and power of decision have reference to a standard of excellence. In the human figure, for example, the ideas of grace and beauty entertained by the Greeks are to this day acknowledged throughout civilized Europe. Among English females, those who approach nearest to the form so much admired in the Venus de Medicis, never fail to awaken a corresponding delight, or an intellectual avowal of the presence of that standard by which is determined the perfection of the human form.

If taste be considered that state of the mind which delights in contemplating works of nature or of art, the frequency of its being so occupied must tend to its advancement in judgment. Webb, speaking of our ability to judge of painting, says, "We have all within us the germs of taste, and, if we exercise our powers, are capable of improving them into a sufficient knowledge of the fine arts, for all the purposes of judging correctly." Taste has never been known to start into perfection, but to have required a series of investigations, leading imperceptibly to a conviction of the correctness of certain particulars on which the judgment could safely repose. This may have been obtained by an infinite variety of modes of comparison, and conceptions respecting their truth. Our minds are variously acted upon during such examinations; our feelings are so differently affected, they are touched by sudden impulses occasioned by our mode of thinking, and more particularly by our ordinary pursuits, that it would be surprising if a number of persons were to declare their opinions on a work of art, to have been derived from a similar association of ideas. All might agree in a general expression of pleasure; but pleasure is a feeling that admits of various degrees of satisfaction, influenced by the different modes by which the knowledge was attained, and on which depended the increased gratification. Burke says, "The imagination is the most extensive province of pleasure and pain, as it is the region of our hopes and fears, and all our passions, that are connected with them; and whatever is calculated to affect the imagination with these commanding ideas, by force of any original natural expression, must have the same power pretty equally over all persons. For, since the imagination is only the representation of the senses, it can only be pleased or displeased with the realities, and, consequently, there must be just as close an agreement in the imaginations as in the senses of persons." But neither our senses nor our imaginations are invariably the same; they are operated upon by time, place, and circumstances. To whatever extent these may promote or retard the acquirement of taste, might be a useless inquiry; since we know, that, by perseverance alone, the requisite quickness of apprehension, or the cultivated understanding, can be derived, which enables us to feel that our highest gratifications do not arise merely from inspecting a work of art, but chiefly from those acquired ideas with which such objects may be associated.

The history of those painters who have attained to the highest eminence in their profession, is sufficient to convince us that their elevation was gained by assiduity. Why is it that those who instruct themselves frequently make the greatest proficients? Depending on their observation, their faculties are in constant requisition; the knowledge they obtain is derived from experience; they reflect, till judgment teaches them to distinguish between affectation and simplicity, between finery and beauty; they also know that their brightest talent is indebted for its lustre to a series of laborious studies, before they can possess acquirements that enable them to feel mentally, and express themselves naturally.

The great and liberal Reynolds cleared away the mysticism that bewildered those who desired to obtain a knowledge of the fine arts. His lectures, delivered at the Royal Academy, are interspersed with the most satisfactory arguments, tending to prove that almost every object of which we are in pursuit may be acquired by diligent observation and its accompanying experience. Reynolds found this position disputed by many—still he reiterated that nothing was denied to well-directed labour. Thomson, who felt as Reynolds did, says, "All is the gift of industry, whate'er exalts, embellishes, or renders life delightful;" yet the principle thus advocated by a painter and a poet, both of whom have dignified their country, is still disputed or tardily admitted.

There are persons who possess lively imaginations, others who are dull, even to apathy. The mass of mankind have faculties fluctuating between these extremes, while we find some who have no admiration of the fine arts, because they perceive nothing therein that conveys an idea of pleasurable sensations: this may be deemed a misfortune, proceeding either from indisposition or from incapacity—perhaps the proper chord has not been struck to which the soul might be attuned. Other persons, possessing a delicate sensibility, will extract pleasure from the representation of any subject that has the slightest association with the appearances of objects they have previously admired in nature; the expressing of delight, arising from such a source, has been considered the effect of enthusiasm, or a bewildered imagination.

To form a comparative judgment of objects, is a power of which every individual is master. Who that placed a dock-leaf or a thistle by the side of a picture, in which either of those objects was represented, would be incapable of distinguishing between the successful imitation and the failure? The capacity to retain in the mind's eye so vivid a recollection of remote objects, as to detect dissimilarity in pictorial representation, is a power requiring but little mental exertion. To possess a feeling for the beautiful, amid the intricacy of natural forms and colours, and to recognise them when represented, is an exercise of taste in the fine arts. It is the basis on which refinement may easily be elevated—a structure which becomes more valuable and extensive in proportion as we have been assiduous in collecting the materials of which it is composed.

Those who are unacquainted with the mechanism of art are astonished at the vast powers possessed by an artist over a few simple materials, by means of which he presents to our view the beautiful in nature that his application has enabled him to select. There is no distinction between knowledge obtained from nature by an artist, and the knowledge gleaned by an unprofessional admirer of nature. There is no patent right in the acquirement of taste, any more than there is a royal path to the mathematics—"all is the gift of industry." If there be any who entertain the idea of arriving at the possession of taste independent of study, they must expect something like enchantment to operate in their favour. Those who neither feel nor regret the want of taste, are least likely to exert themselves for improvement.

There is an affectation of musical taste, of poetic feeling, and of intimacy with the art of painting. Now, all these must be supported at considerable risk, for nothing can be more absurd than the constant endeavour to appear that which we are not. The dread of the truth peeping from beneath the disguise, and the consequent exposure of our ignorance, demands a greater exertion of the mind to surmount, than even the study necessary to the acquirement of a tolerable portion of valuable information. We should endeavour to become sensible of our defects, that we may entertain a hope of their removal. All extraordinary modes of acquiring information, like the cramming for a degree at the universities, become stumbling-blocks, that impede the search for what is genuine. Hints on the road may be useful; but even these should be examined, and their correctness ascertained, before they can be valuable to the traveller after taste in the fine arts.

So numerous are the productions of the pencil, so various are the peculiarities of style, enriched by beauty of colour, elegance of composition, or grandeur of effect, that to be unacquainted with the principles of that power which can so pleasingly affect our perception, influence our feelings, or command our approbation, implies a deficiency in education of a nature connected with the dark ages. In this period of general improvement, it is absolutely incumbent on us to read extensively, and to study nature assiduously, for the acquirement of taste, to enable us to appreciate talent, or to apply just and liberal criticism.

The simplest effort in drawing by a child is frequently calculated to excite sensations of pleasure; but the ability to point out one line or touch deserving of approbation, is not only estimable in the judge, but it is of incalculable value to young aspirants. From that moment may be dated a desire for improvement—a love of art has been implanted—appeals to nature become frequent—feeling is acquired—truth rendered evident—and taste is the result of such employment. Even this slight exercise of taste and judgment on the sketches of a child should be regulated by a knowledge of the object in nature, without which it is nothing more than ignorant presumption; for it should be recollected, that whoever studies art alone will have a narrow manner of considering all objects, and of referring them to that particular style to which their attention may have been directed. We may profit by the instruction which painters afford, but even they are indebted to the beautiful in nature for the most alluring of their productions.

To judge of a picture, or to decide on its excellence from the reputation of the artist who painted it, is productive of confusion, and often the confirmation of ignorance. Artists have their rise, meridian, and set, of talent. Richardson was of opinion there never was a faultless picture, and rarely one to be seen in which there were not notorious defects. The circumstance that a picture is highly esteemed by its possessor, or that it was once in the gallery of some distinguished personage, or that the artist or some picture-dealer received a large sum of money for it, offer no proof of superior excellence, nor ought that to influence the judgment of an admirer of truth and nature. The intrinsic merit of the picture is the criterion—Will it bear the ordeal of comparison with its original? If it will not, approbation is properly withheld. Thus it should be throughout the vast variety of subjects presented to our inspection. It is the language of the painter addressed to our knowledge and experience in the beauties of nature. If we be incompetent to the understanding of his appeal, let us neither insult him, nor become the promulgators of our ignorance. As in ordinary conversation the

greatest pleasure experienced by the parties is their being reciprocally understood, so, with the production of an artist, the satisfaction he conveys is attributable to the knowledge we possess of his subject, and the sources of his information.

The dog that ran against a picture on which steps were represented, and the bird that picked an imitative bunch of grapes, were alike deceived. Had they been capable of appreciating the talent displayed in those paintings, they would have been delighted with the truth of representation.

SAILING DOWN THE OHIO.

[By Audubon.]

The natural features of North America are not less remarkable than the moral character of her inhabitants; and I cannot find a better subject than one of those magnificent rivers that roll the collected waters of her extensive territories to the ocean.

When my wife, my eldest son (then an infant), and myself, were returning from Pennsylvania to Kentucky, we found it expedient, the waters being unusually low, to provide ourselves with a *skiff*, to enable us to proceed to our abode at Henderson. I purchased a large, commodious, and light boat of that denomination. We procured a mattress, and our friends furnished us with ready-prepared viands. We had two stout negro rowers, and in this trim we left the village of Shippingport, in expectation of reaching the place of our destination in a very few days.

It was in the month of October. The autumnal tints already decorated the shores of that queen of rivers, the Ohio. Every tree was hung with long and flowing festoons of different species of vines, many loaded with clustered fruits of varied brilliancy, their rich bronzed carmine mingling beautifully with the yellow foliage, which now predominated over the yet green leaves, reflecting more lively tints from the clear stream than ever landscape painter pourtrayed or poet imagined.

The days were yet warm. The sun had assumed the rich and glowing hue which at that season produces the singular phenomenon called there the "Indian summer." The moon had rather passed the meridian of her grandeur. We glided down the river, meeting no other ripple of the water than that formed by the propulsion of our boat. Leisurely we moved along, gazing all day on the grandeur and beauty of the wild scenery around us.

Now and then a large cat-fish rose to the surface of the water in pursuit of a shoal of fry, which, starting simultaneously from the liquid element, like so many silvery arrows, produced a shower of light, while the pursuer with open jaws seized the stragglers, and, with a splash of his tail, disappeared from our view. Other fishes we heard uttering beneath our bark a rumbling noise, the strange sounds of which we discovered to proceed from the white perch, for on casting our net from the bow, we caught several of that species, when the noise ceased for a time.

Nature, in her varied arrangements, seems to have felt a partiality towards this portion of our country. As the traveller ascends or descends the Ohio, he cannot help remarking, that, alternately, nearly the whole length of the river, the margin, on one side, is bounded by lofty hills and a rolling surface; while, on the other, extensive plains of the richest alluvial land are seen as far as the eye can command the view. Islands of varied size and form rise here and there from the bosom of the water, and the winding course of the stream frequently brings you to places where the idea of being on a river of great length changes to that of floating on a lake of moderate extent. Some of these islands are of considerable size and value; while others, small and insignificant, seem as if intended for contrast, and as serving to enhance the general interest of the scenery. These little islands are frequently overflowed during great *freshets* or floods, and receive at their heads prodigious heaps of drifted timber. We foresaw with great concern the alterations that cultivation would soon produce along those delightful banks.

As night came, sinking in darkness the broader portions of the river, our minds became affected by strong emotions, and wandered far beyond the present moments. The tinkling of bells told us that the cattle which bore them were gently roving from valley to valley in search of food, or returning to their distant homes. The hooting of the great owl, or the muffled noise of its wings as it sailed smoothly over the stream, were matters of interest to us; so was the sound of the boatman's horn, as it came winding more and more softly from afar. When daylight returned, many songsters burst forth with echoing notes, more and more mellow to the listening ear. Here and there the lonely cabin of a squatter struck the eye, giving note of commencing civilization. The crossing of the stream by a deer foretold how soon the hills would be covered with snow.

Many sluggish flat-boats we overtook and passed—some laden with produce from the different headwaters of the small rivers that pour their tributary streams into the Ohio; others, of less dimensions, crowded with emigrants from distant parts, in search of a new home. Purer pleasures I never felt; nor have you, reader, I ween, unless indeed you have felt the like, and in such company.

The margins of the shores and of the river were at this season amply supplied with game. A wild turkey, a grouse, or a blue-winged teal, could be procured in a few moments; and we fared well, for, whenever we pleased, we landed, struck up a fire, and provided as we were with the necessary utensils, procured a good repast.

Several of these happy days passed, and we neared our home, when, one evening, not far from Pigeon Creek (a small stream which runs into the Ohio, from the state of Indiana), a loud and strange noise was heard, so like the yells of Indian warfare, that we pulled at our oars, and made for the opposite side as fast and as quietly as possible. The sounds increased; we imagined we heard cries of "murder;" and as we knew that some depredations had lately been committed in the country by dissatisfied parties of aborigines, we felt for a while extremely uncomfortable. Ere long, however, our minds became more calmed, and we plainly discovered that the singular uproar was produced by an enthusiastic set of Methodists, who had wandered thus far out of the common way, for the purpose of holding one of their annual camp-meetings, under the shade of a beech forest. Without meeting with any other interruption, we reached Henderson, distant from Shippingport by water about two hundred miles.

When I think of these times, and call back to my mind the grandeur and beauty of those almost uninhabited shores; when I picture to myself the dense and lofty summits of the forest, that every where spread along the hills, and overhung the margins of the stream, unmolested by the axe of the settler; when I know how dearly purchased the safe navigation of that river has been by the blood of many worthy Virginians; when I see that no longer any aborigines are to be found there, and that the vast herds of elks, deer, and buffaloes, which once pastured on these hills and in these vallies, making for themselves great roads to the several salt springs, have ceased to exist; when I reflect that all this grand portion of our Union, instead of being in a state of nature, is now more or less covered with villages, farms, and towns, where the din of hammers and machinery is constantly heard; that the woods are fast disappearing under the axe by day, and the fire by night; that hundreds of steamboats are gliding to and fro, over the whole length of the majestic river, forcing commerce to take root and to prosper at every spot—when I see the surplus population of Europe coming to assist in the destruction of the forest, and transplanting civilization into its darkest recesses—when I remember that these extraordinary changes have all taken place in the short period of twenty years, I pause, wonder, and, although I know all to be fact, can scarcely believe its reality.—*American Ornithology.*

THE POISONER,

A TALE OF GERMANY.

[The following remarkable story of real life is condensed, in the Foreign Quarterly Review, from Feuerbach's German Criminal Trials. We have in general a decided objection to the horrible, whether in the shape of supernatural fictions, or of transactions of an atrocious character in real life. The former tend to confound, in young minds, all proper perceptions of natural facts; while the latter, by familiarising the same minds with wicked actions, and giving the charm of fame to their perpetrators, are apt to lead to a similar, instead of (as their promulgators sometimes profess to hope) a contrary line of conduct. At the very best, such narratives are not favourable to the improvement of taste; and, for all reasons put together, we carefully avoid them in the present work. There is a difference, however, between an account of a criminal, such as those in the Newgate Calendar, where the circumstances of the crime are alone dwelt on, and one where the *state of mind* which produced the crime is inquired into and moralised upon; and as the following story, in addition to its extraordinary interest, possesses this salutary property, we make no scruple to present it to our readers.]

In 1808, a widow, about fifty years old, resident at Pegnitz, and bearing the name of Anna Schonleben, was received as housekeeper into the family of the Justiz-Amptmann Glaser, who had for some time previous been living separate from his wife. Shortly after the commencement of her service, however, a partial reconciliation took place, in a great measure effected through the exertions of Schonleben, and the wife returned to her husband's house. But their reunion was of short duration, for in the course of four weeks after her return she was seized with a sudden and violent illness, of which in a day or two she expired.

On this event, Schonleben quitted the service of Glaser, and was received in the same capacity into that of the Justiz-Amptmann Grohmann, then unmarried. Though only thirty-eight years of age, he was in delicate health, and had suffered severely from the gout, so that Schonleben had an opportunity of showing, by the extreme care and attention which she bestowed upon his comforts, her qualifications for the office she had undertaken. Her cares, however, it seemed were unavailing: her master fell sick in spring 1809, his disease being accompanied with violent internal pains of the stomach, dryness of the skin, vomiting, &c., and he died on the 8th May, after an illness of eleven days. Schonleben, who had attended him with unremitting attention during his illness, administering all his medicines with her own hand, appeared inconsolable for his loss—and that of her situation.

The high character, however, which she had acquired for her prudence, care, and gentleness, as a sick-nurse, immediately procured her another in the family of the Kammer-Amptmann Gebhard, whose wife was at that time on the point of being confined. This event took place on the 13th May, shortly after the entry of the new housekeeper, who made herself particularly useful, and mother and child were going on extremely well, when, on the third day after the birth, the lady was seized with spasms, internal heat, violent thirst, vomiting, &c. In the extremity of her agony she frequently exclaimed that they had given her poison. Seven days after her confinement, she expired.

Gebhard, the widower, left without any one to take the management of his domestic affairs, thought that, in the meantime, he could not do better than retain in his service the housekeeper, who, during his wife's illness, had distinguished herself so much by the zeal and assiduity of her attentions to the invalid. Some of his friends attempted to dissuade him from retaining an inmate who seemed by some fatality to bring death into every family with which she became connected; but Gebhard, who was not of a superstitious turn, laughed at their apprehensions, and Schonleben remained in his house, now invested with almost unlimited authority.

During her residence here, many circumstances occurred, which, though at the time they excited little attention, were subsequently recollected and satisfactorily established. These will be hereafter alluded to: meantime we proceed to that which first directed suspicion against her. Gebhard had, at last, by the importunity of a friend, who (from what ground he did not explain) had advised him to dismiss his housekeeper, been prevailed on to take his advice, and had communicated as gently as possible his resolution to Schonleben herself. She received it without any observation, except an expression of surprise at the suddenness with which he had changed his mind, and the next day was fixed for her departure for Bayreuth. Meantime she bustled about as usual, arranged the rooms, and filled the salt-box in the kitchen, observing that it was the custom for those who went away to do so for their successors. On the morning of her departure, as a token of her good will, she made coffee for the maids, supplying them with sugar from a paper of her own. The coach, which her master had been good-natured enough to procure for her, was already at the door. She took his child, now twenty weeks old, in her arms, gave it a biscuit soaked in milk, caressed it, and took her leave. Scarcely had she been gone half an hour, when both the child and the servants were seized with violent retching, which lasted for some hours, leaving them extremely weak and ill. Suspicion being now at last fairly awakened, Gebhard had the salt-box examined which Schonleben had so officiously filled. The salt was found strongly impregnated with arsenic. In the salt-barrel, also, from which it had been taken, thirty grains of arsenic were found, mixed with about three pounds of salt.

That the series of sudden deaths which had occurred in the families in which Schonleben had resided, was owing to poison, now occurred to every one as clear; and they almost wondered how so many circumstances could have passed before their eyes without awakening them to the truth. During her residence with Gebhard, it appeared that two visitors who had dined with her master, in August 1809, were seized after dinner with the same symptoms of vomiting, convulsions, spasms, &c. which had affected the servants on the day of Schonleben's departure, and of which the more unfortunate mistress of the family had expired; that on one occasion she had given a glass of white wine to Rosenhauer, a servant who had called with a message, which had occasioned similar symptoms, so violent indeed as to oblige him for a day or two to keep his bed; that on another, she had taken a lad of nineteen, Johann Kraus, into the cellar, where she offered him a glass of brandy, which, after tasting, and perceiving a white sediment within it, he declined; that one of the servants, Barbara Waldmann, with whom Schonleben had frequent quarrels, after drinking a cup of coffee, was seized with exactly the same symptoms as her companions; and what, perhaps, appeared the most extraordinary of all, that at a party given by her master on the 1st September, having occasion to send her to his cellar for some pitchers of beer, he himself, and all the guests that partook of it, five in number, were almost immediately afterwards seized with the usual spasms, sickness, &c., which seemed to accompany the use of those liquids whenever they were dispensed by Schonleben.

Although from the long period which had elapsed since the death of those individuals, whose fate there was reason to suppose had been so prematurely accelerated by this smooth-faced poisoner, there was no great probability that any light would be thrown upon these dark transactions by an inspection of the bodies, it was resolved on at all events to give the matter a trial. The result of this ghastly examination, however, was more decisive than could have been expected; all the bodies exhibited, in a greater or less degree, those appearances which modern researches into the effects of poisons have shown to be produced by the use of arsenic; and in one of them in particular, that of the wife of Glaser, the arsenic was still capable of being detected in substance. On the whole, the medical inspectors felt themselves warranted in concluding, that the deaths of at least two individuals out of the three had been occasioned by poison.

Meantime, Schonleben had been living quietly at Bayreuth, seemingly quite unconscious of the storm

which was gathering around her. Her finished hypocrisy even led her, while on the road, to write a letter to her late master, reproaching him with his ingratitude in dismissing one who had been a protecting angel to his child; and in passing through Nurnberg, to take up her residence with the mother of her victim, the wife of Gebhard. On reaching Bayreuth she again wrote more than once to Gebhard; the object of her letters evidently being to induce him again to receive her back into his family. She made a similar attempt on her former master, Glaser, but without success. While engaged in these negociations, the warrant arrived for her apprehension, and she was taken into custody on the 19th October. On examining her person, three packets were found in her pocket, two of them containing fly-powder, and the third arsenic.

For a long time she would confess nothing; evading with great ingenuity, or resisting with obstinacy, every attempt to obtain from her any admission of her guilt. It was not till the 16th April 1810, that her courage gave way, when she learned the result of the examination of the body of Glaser. Then at last, weeping and wringing her hands, she confessed that she had on two occasions administered poison to her. No sooner had this confession been uttered, than she fell to the ground as if struck by lightning, and was removed in strong convulsions from the chamber.

We shall condense into a short connected statement the substance of the numerous examinations which this wretch subsequently underwent, and of the information acquired from other sources, by which her statements were in many particulars modified, and in some points refuted. Born in Nurnberg in 1760, she had lost both her parents before she reached her fifth year. Her father had possessed some property, and till her nineteenth year she remained under the charge of her guardian, who was warmly attached to her, and bestowed much care on her education. At the age of nineteen, she married, rather against her inclination, the notary Zwanziger, for such, not Schonleben, was her real name. The loneliness and dullness of her matrimonial life contrasted very disagreeably with the gaieties of her guardian's house; and in the absence of her husband, who divided his time between business and the bottle, she dispelled her ennui by sentimental novel-reading, weeping over the Sorrows of Werter, and the struggles of Pamela and Emilia Galotti. The property which fell to her on her coming of age was soon dissipated by her husband and herself in extravagant entertainments and an expensive establishment, and a few years saw them sunk in wretchedness, with a family to support, and without even the comfort of mutual cordiality or esteem; for the admirer of Pamela, whose sympathetic heart had bled for the Sorrows of Werter, now attempted to prop the falling establishment, by making the best use she could of her personal attractions (which, hideous and repulsive as she appeared at the time of her trial, she described as having once been very considerable), while her husband, as mean and grovelling in adversity as he had been assuming and overbearing in prosperity, was a patient spectator of his own dishonour. Shortly afterwards he died, leaving his widow to pursue her career of vice and deceit alone. During the time which intervened between the death of her husband, and that when she first entered the service of Glaser, her life had been one continued scene of licentiousness and hypocrisy. Devoid of principle from the first, mingling chiefly with others who, though of respectable or exalted rank, were as destitute of it as herself; forced to pretend attachment where none was felt; to submit where she would willingly have ruled; sometimes laughed at or treated with ingratitude where she was really labouring to please; a wanderer on the earth for twenty years, without a resting-place or a sincere friend; she became at last a habitual hypocrite, to whom falsehood seemed to be actually more natural than truth. Rage and disappointment at her fate, and a bitter hatred against mankind, seemed to have gradually been maturing in her heart; till at last all the better sympathies of her nature were poisoned, and nothing remained but the determination to better her condition at the expense of all those ties which humanity holds most sacred. When and how the idea of poison dawned on her—whether suddenly, or by degrees, her confessions did not explain; but there is every reason to believe that this tremendous agent had been employed by her previous to her appearance in Glaser's house. Determined as she was at all hazards to advance her own interests, poison seemed to furnish her at once with the talisman she was in search of;—it punished her enemies, it removed those who stood in her way;—its operation afforded her the means of rendering her good qualities conspicuous in her affected sympathy for the sufferer;—nay, administered in smaller quantities by her experienced hand, it was equally effectual in preventing a second visit from a disagreeable guest, or annoying a fellow servant with whom she had a quarrel. By long acquaintance, poison had become so familiar to her, that she seemed to look on it as a useful friend; something equally available for seriousness or jest; and to which she was indebted for many a trusty and secret service. When the arsenic which had been taken from her pocket was exhibited to her some months afterwards at Culmbach, she seemed to tremble with delight; her eyes glistened as she gazed upon it, as if she recognised a friend from whom she had long been separated. Of the crimes which she had perpetrated, too, she always spoke as of slight indiscretions rendered almost necessary by circumstances —so completely by repetition had murder itself lost its character of horror.

From the first moment she had entered the house of Glaser, the idea of obtaining an influence over his mind, so as to secure him as her husband, had occurred to her. That he was then married, was immaterial: poison would be the speediest process of divorce. First, however, the victim must be brought within the range of her power; hence her anxiety to effect the reconciliation of the pair, and the return of the wife to her husband's house. The plan succeeded, and within a few weeks after her return, Zwanziger commenced her operations. Two successive doses were administered, of which the last was effectual. "While she was mixing it," she said, "she encouraged herself with the notion that she was preparing for herself a comfortable establishment in her old age." This prospect having been defeated by her dismissal from Glaser's service, she entered that of Grohmann. Here her common mode of revenging herself upon such of her fellow-servants as she happened to dislike, was to mix fly-powder with the beer in the cellar, in the hope of creating illness, though not death; and of this beer it happened more than once that some of the visitors at Grohmann's table also partook. These, however, were mere preparations "to keep her hand in;" the victim for whom her serious poisons were reserved was her unfortunate master. Here also she had for some time indulged the hope of a matrimonial connexion; infirm and gouty as he was, she thought she would obtain such an ascendancy over him as to induce him to descend to this alliance; when all at once her hopes were blasted by hearing of his intended marriage with another. For some time she tried, by every means in her power, to break off the connexion: but her arts proved ineffectual, and Grohmann, provoked by her pertinacity, had mentioned to a friend that he could no longer think of retaining her in his service. The wedding-day was fixed; all hopes of preventing the marriage were at an end; and nothing now remained for her but revenge. In five days afterwards, Grohmann fell a victim to poison.

From this service Zwanziger passed into that of Gebhard, whose wife soon shared the fate of Grohmann; for no other reason, according to her own account, than because that lady had treated her harshly, and occasionally found fault with her management of the house. Even this wretched apology was contradicted by the facts proved by the other inmates of the house. The true motive, as in the preceding cases, was, that she had formed designs upon Gebhard similar to those which had failed in the case of Glaser, and that the unfortunate lady stood in the way. Her death was accomplished by poisoning two pitchers of beer, from which Zwanziger from time to time supplied her with drink. Nay, even her husband was made the innocent instrument of his wife's death, by administering the same liquid to the invalid. Even while confessing that she had thus poisoned the beer, she persisted in maintaining that she had no intention of destroying the unfortunate lady; if she could have foreseen that such a consequence would have followed, she would rather have died!

During the remaining period, from the death of Gebhard's wife to that of her quitting his service, she admitted having frequently administered poisoned beer, wine, coffee, and other liquids, to such guests as she disliked, or to her fellow-servants, when any of them had the misfortune to fall under her displeasure. The poisoning of the salt-box she also admitted; but with that strange and inveterate hypocrisy which ran through all her confessions, she maintained that the arsenic in the salt-barrel must have been put in by some other person.

The fate of such a wretch could not of course be doubtful; she was condemned to be beheaded, and listened to the sentence apparently without emotion. She told the judge that her death was a fortunate thing for others, for she felt that she could not have left off poisoning had she lived. On the scaffold she bowed courteously to the judge and assistants, walked calmly up to the block, and received the blow without shrinking.

BATTLE BETWEEN TWO SNAKES.

As I was one day sitting in my arbour, my attention was engaged by a strange rustling noise at some paces distant. I looked around without distinguishing any thing, until I climbed one of my great hempstalks, when, to my astonishment, I beheld two snakes of considerable length, the one pursuing the other with great celerity. The aggressor was of the black kind, six feet long: the fugitive was a water-snake, nearly of equal dimensions. They soon met, and in the fury of their first encounter they appeared in an instant firmly twisted together; and whilst their united tails beat the ground, they tried with open jaws to lacerate each other. What a fell aspect did they present! Their heads were compressed to a very small size, their eyes flashed fire; and after this conflict had lasted about five minutes, the second found means to disengage itself, and hurried towards the ditch. Its antagonist instantly assumed a new posture, and, half creeping, overtook and again attacked the other, which placed itself in the same attitude, and prepared to resist. The scene was beautiful; thus opposed, they fought with the utmost rage, but, notwithstanding this appearance of mutual courage, the water-snake seemed desirous of retreating towards the ditch, its natural element. This was no sooner perceived by the keen-eyed black one, than, twisting its tail twice round a stalk of hemp, and seizing its adversary by the throat, not by means of its jaws, but by twisting its own neck twice round that of the water-snake, it pulled the latter back from the ditch. To prevent a defeat, the water-snake took hold likewise of a stalk on the bank, and by this acquisition became a match for its fierce antagonist. Strange was this to behold two great snakes strongly adhering to the ground, fastened together by means of the writhings which lashed them to each other, and stretched at their full length. They pulled, but pulled in vain, and in the moments of the greatest exertions, that part of their bodies which was entwined seemed extremely small, while the rest appeared inflated, and now and then convulsed with strong undulations rapidly following each other. Their eyes seemed on fire, and ready to start out of their heads. At one time the conflict seemed decided. The water-snake bent itself into two great folds, and by that operation rendered the other more than commonly outstretched. The next minute the new struggles of the black one gained an unexpected superiority; it acquired two great folds likewise, which necessarily extended the body of its adversary in proportion as it had contracted its own. These efforts were alternate. Victory seemed doubtful, inclining sometimes to the one side and sometimes to the other, till at last, the stalk to which the black snake was fastened suddenly gave way, and they both plunged into the ditch. The water did not extinguish their vindictive rage, for, by their agitations I could trace, though not distinguish, their mutual attacks. They soon re-appeared on the surface, twisted together as on their first onset; but the black snake seemed to retain its wonted superiority, for its head was exactly fixed above that of the other, which it incessantly pressed down under the water, until it was stifled, and sunk. The victor no sooner perceived its enemy incapable of further resistance, than, abandoning it to the current, it returned on shore and disappeared.—*Letters from an American Farmer.*

DESCRIPTION OF A MAN-OF-WAR VESSEL.

(Concluded.)

THE grand divisions of the crew are into petty officers, seamen, ordinary seamen, landsmen, and boys. This division has reference to rank; but there are others, into which considerations of this kind do not enter. Such are the military divisions, and the divisions into larboard and starboard-watches, into forecastlemen, fore, main, and mizentopmen, afterguard, waisters, holders, &c.

The petty officers are appointed by the commander, and may be degraded by him without the formalities of a court-martial. They are selected from among the most experienced and trustworthy of the seamen, and receive eighteen dollars per month. They consist, on board of a frigate, of a master-at-arms, eight quartermasters, four boatswain's mates, eight quartergunners, a boatswain's and gunner's yeomen, a carpenter and sailmaker's mate, an armourer, a cooper, cook, and cockswain.

The highest and most responsible of the petty-officers is the master-at-arms. He is, if I may be allowed the expression, the principal police-officer of the ship. He has charge of all the prisoners, and every morning makes out and hands to the commander a list of their names, with a specification of the crime for which each is confined, and the time when he was put in confinement. If he allows any of them to escape, he is liable to be punished in their stead. He counts the blows audibly when a prisoner is flogged with the cats. It is his duty to search those suspected of thefts, and when a man dies, to take an account of his clothes and other effects. At public sales he is the auctioneer. He has charge also of the berth-deck, and it is his duty to see that it is kept in good order. All property that falls in his way for which he cannot find an owner, is thrown into the "lucky bag," the contents of which, if not finally claimed, are sold at auction.

The office of quartermaster is one of some dignity and considerable importance. Its duties are not laborious, but they require vigilance, carefulness, judgment, and a thorough acquaintance with practical seamanship. In port, only one of them keeps watch on deck at a time. You may know him by his spy-glass and his busy, bustling air. He is all eye and all locomotion. He cocks his telescope at every new object that appears, and gives it a thorough scrutiny. It is his duty to keep a look-out for signals from other ships, and to report them to the officer of the deck; and also to report to him all boats that come alongside, and all other movements and occurrences in the harbour, which he may deem of sufficient importance. At sea, two of the quartermasters are required to be on deck during the day, and half of them at night. One is stationed at the wheel to steer the ship, and the others keep a look-out as in port. When the log is thrown, they hold the minute-glass. They have to strike the bell every half-hour, and take turns in mixing and serving the grog. In entering and leaving a harbour, when it is necessary to sound, one of them is stationed in each of the main chains to heave the lead. All the colours and signals are under their charge.

Boatswain's mates are an indispensable class of

men on board of a man-of-war, but their office is the most invidious and least desirable of all. Their duty is to enforce the orders of the officers, and, to enable them to do this, each is furnished with a hemp whip, consisting of only one lash, called the colt. They have to perform all the flogging, and the men hate them therefore as they would so many incarnate devils. In the ordinary flogging the colt is always used; but when all hands are called to witness punishment, another whip, composed of nine lashes, and called the cats, is employed. Each of the boatswain's mates has a silver whistle suspended from his neck, with which he echoes the orders of his superiors. He has a different pipe for almost every important order that can be given. For instance, there is one for calling all hands, another for hoisting away, a third for hauling taught and belaying, and so on of others. Amid the darkness and fury of the tempest, when the orders of the trumpet are drowned by the loud uproar of the elements, the shrill pipe of the boatswain's whistle reaches the ear of the sailor on the top of the highest mast, and no language could convey to him a more definite meaning than its well-known tones.

The duty of the quartergunners is to keep the guns, and all other things belonging to the gunner's department, in proper order. They have to inspect the guns frequently, to see that every thing about them is well secured, and at night report their condition to the officer of the deck every two hours. When all hands are called to reef or furl sails, the quartergunners and quartermasters are charged with the mainyard.

The yeomen and mates of the forward officers have charge of their respective store-rooms, and keep accounts of the expenditures of articles from each of their departments. They make out monthly and quarterly returns of these expenditures, which are handed to the captain, examined by his clerk, and inserted in the general account-book.

The armourer is the ship's blacksmith. The cooper opens the provision barrels when their contents are wanted, and performs other matters in his line of business, when necessary. The duties of the cook are somewhat arduous, and it requires a good deal of patience and care to perform them acceptably to the crew. The meals must always be reported "ready" at seven-bells morning, noon, and night. At noon, when dinner is reported ready, the cook takes a specimen to the officer of the deck, who inspects it, to see that it is properly cooked. The cockswain is designed for the captain's boat, but our commanders sometimes, perhaps generally, give this rank to their steward, and select a quartermaster, or other trustworthy person, to perform the duties of cockswain.

There are two other officers, who have not even the rank of petty officers. They are the ship's corporals. They take turns in keeping watch at night on the gundeck, and their duty is to see that no light is burning in any part of the ship where it is not allowed. They make an hourly report to the officer of the deck.

Having dispatched the petty officers, I come now to the rest of the crew, of which the seamen generally compose about one-half. Those of this rank must have seen a good deal of sea service, and are supposed to be thoroughly acquainted with practical navigation. If they are found to be greatly deficient in this respect, they are degraded. They receive twelve dollars per month, and are appointed to the most honourable and responsible stations in the ship. They have a good deal of the pride of profession, entertaining the utmost contempt for all who do not know what salt water and heavy gales are.

The ordinary seamen receive ten dollars per month. They must have had some experience in naval matters, but are neither expected nor required to be finished sailors. Promotions from the rank of ordinary seamen to that of seamen are not unfrequent. The landsmen are as green as a cucumber, having never smelt the ocean, nor been initiated at all into the mysteries of a seafaring life. Their pay is eight dollars.

Of the boys, there are two classes—those who receive eight dollars, and those who receive five dollars per month. They are employed principally in the capacity of servants to the officers. Two are allowed to the captain, besides his steward, one to the first lieutenant, one to every two of the other wardroom officers, and one or two, according to the pleasure of the first lieutenant, to the cockpit, forward officers, and each of the steerage messes. Some are employed as cooks at the galley, and others as messenger-boys on the quarterdeck The boys and all others on shipboard, who do not keep watch, are called *idlers*.

On board of a frigate there are six military divisions; one on the quarterdeck, one on the forecastle, three on the gundeck, and one on the berthdeck. The last is commanded by the purser, and each of the others by a lieutenant. It is the business of those who compose the purser's division to pass up powder to the combatants. Every officer and man is included in one or the other of these divisions, and is stationed in a particular part of the ship. These are the stations for action, and are called general quarters. The crew is mustered and inspected at quarters always once, and on board many of our ships, twice a-day. There are ten or twelve men to each of the guns in a broadside, called first and second captains, spungers, loaders, powder-boys, &c. The first intimation of quarters is a blast from the bugle, calling the music. The boarders run for their caps, and every man seizes a cutlass. At the first tap of the drum, there is a general rush throughout the ship, and before the music has ceased, you may hear the midshipmen of the divisions calling over the names, George Bell—first captain, sir—James Anderson—second captain, sir—William Stokes—powder-boy, sir—and so on. Having called the names, the midshipmen report to the officers of their divisions, the officers of the divisions to the first lieutenant, and he again to the captain. The order is then given to "beat the retreat." Another rush takes place, the cutlasses and boarding-caps are returned to their places, and the men, as the case may be, proceed to their daily labours or their evening diversions. All this is but the work of a moment. Sometimes the call to quarters is beaten in the dead of night, and then the men are obliged to get up, lash their hammocks, take them on deck, and stow them in the nettings, and be ready to answer to their names in the space of about eight or ten minutes. The midshipmen have to do the same. They generally, however, avoid the labour of carrying their hammocks on deck, by stowing them in the mess-room. This is to accustom them to sudden alarms. but it is not often practised.

What is of vastly more importance is experienced in the art of gunnery; and it must be mentioned, to the honour of our naval officers, that they are indefatigable in their exertions to render our seamen expert and ready in this branch of their profession. In good weather some of the divisions are exercised at the guns almost daily, and on board most of our ships, one day in the week, there are general quarters for that purpose. On these occasions, all the evolutions of a regular engagement, such as loading and firing the guns, boarding, extinguishing fire, &c., are gone through with. All this is of course a mere sham, and not an ounce of gunpowder is burnt; but it gives the men experience, makes them expert at working the guns, and cannot fail to fill them with confidence and bravery in the hour of real peril.

In the general quarter bill, the surgeons are stationed in the cockpit. Here all the wounded are brought, and all the surgical operations performed, in time of action. The chaplain is also stationed in the cockpit to give pious counsels, and administer the comforts of religion to the dying.

In addition to their general quarters, the men are also stationed for getting under weigh, and coming to an anchor for tacking and veering, and for other general evolutions. I have sometimes been astonished to see how quick, in the darkest night, it is discovered that a man is missing from his post, and how speedily he is searched out and brought to it. But not only does every man know his station: he has a specific duty to perform at every order, and a failure on his part might disconcert the whole operation. Thus, it will be seen, that, notwithstanding the complicated nature of naval evolutions, and the apparent confusion which must necessarily prevail when all hands are called, there is in fact the greatest possible order, efficiency, and harmony of action. I might go on *ad infinitum* with details of this kind, all tending to show the admirable adaptation to each other of the parts, and the general perfection of the whole of that system of internal polity which prevails on board a man-of-war, but I am afraid of trespassing upon my reader's patience.

The whole crew is divided into two equal portions, called larboard and starboard watches, from the fact that those belonging to one of the divisions stow their hammocks in the larboard, and those belonging to the other, in the starboard nettings. When at sea, each of the watches at night takes a turn of four hours on deck, while the others are allowed to "turn in." Those in their hammocks call it their "watch below." Those, however, who keep watch on deck, when the weather is fair and the ship under easy sail, are allowed to sleep, if they do not disturb the general tranquillity by their ungracious snoring. In port, only a quarter-watch is called, except in squally weather, and these are for the most part allowed to stow themselves away somewhere on the gundeck.

At sea, the marines, in succession, all do duty as sentries in the following places—one at the cabin-door, one at the scuttle-butt, one at the brig, and one at the fore-passage on the berthdeck. The rest are obliged to pull and haul on the ropes like the sailors, but they are excused from going aloft. In port there are three additional sentries, viz. one at each of the gangways, and another on the bowsprit. During the day, a serjeant's guard, consisting of thirteen, are required to be dressed in uniform, and to remain on the quarterdeck. A marine in uniform must never pass the capstern without paying it his respects: in undress, he is not required to show it more politeness than a sailor.

The reader may be curious to know how so many persons as compose the crew of a frigate can find employment in the ordinary business of the ship. The time of most of them is chiefly occupied in "keeping the ship in order." This might seem, at first, a simple affair, and capable of being soon dispatched; but there are more things included in "keeping a ship in order" than the philosophy of a greenhorn ever dreamed of. Not only must every part of her be kept as clean as a lady's parlour, and every article arranged for inspection as carefully as a coquette would adjust her toilet, but there are kinds of work to be performed, of which a person unacquainted with a man-of-war could form no conception. The "bright work" requires immense labour. This consists in scouring all the belaying-pins and rings on the spardeck, the brass on the capstern, about the companionways, and in other parts of the ship: the monkey-tails, iron handspikes, and cutlasses; the two rows of iron stanchions which support the spardeck, the hoops of the spit-boxes (of which there is one to every gun, and a plentiful quantity distributed throughout other parts of the ship), the battle-axes, priming-wires, &c. All this is to be done every day, and if but a modicum of rust is left, woe be to the luckless wight at whose door it lies. It is sure to give employment to a boatswain's mate. Besides this, all the ladders, combings of the hatches, wooden handspikes, &c. must be scraped perfectly clean. Add to all this the labour performed by the different gangs of mechanics, and the working of the guns, and loosing and furling sails for the pure purpose of experience, and the wonder will rather be, that so few men should be required, than that so many can find employment.*

POPULAR INFORMATION ON SCIENCE.

PARHELIA, OR MOCK SUNS—PARASELENÆ, OR MOCK MOONS.

THE parhelia, or mock suns, vary considerably in appearance, and in their relative position to the accompanying halo, being sometimes observed at the spot where one halo meets, or bisects another; and sometimes within the circumference of the principal halo, while it is itself surrounded by smaller halos. These mock suns have usually a stream of white pyramidal light, extending like the tail of a comet from them, and they vary much in the intensity of the light they exhibit. "A rare and curious phenomenon (says Mr Tyler) was observed on the 11th of January last. The weather had been mild for a number of days previous, and on that day the thermometer ranged from 23° to 30°. The atmosphere was so hazy that a shadow was but faintly visible, the haziness being most dense near the south horizon, but growing rarer, and finally disappearing a little north of the zenith. The first appearance was a brilliant parhelion. Its form at first was nearly circular, and its apparent diameter a little greater than that of the true sun. Its light, which was of a brilliant white, was so intense as to pain the eyes. In a few moments, another parhelion, of equal brightness, appeared at the same distance on the east side of the sun, and at the same altitude. When first seen, it appeared a little elongated vertically, and slightly coloured. Both these parhelia retained their size and appearance for a few moments, and then began to lengthen in a vertical direction, and show the prismatic colours with considerable brilliancy. Directly above the sun appeared, at the same time with the parhelia, a coloured arc, having its centre in the zenith, and its convexity towards the sun. The exterior was red; the other colours were merged into each other, but the blue and green were predominant, though faint."† "I do not recollect (says Captain Scoresby) to have observed these phenomena more than thrice. The first occurred on one of my earliest voyages to the fishery, and passed off as a wonderful appearance, without inducing me to minute the particulars. I perfectly recollect, however, that there were two or three parhelia, and four or five coloured circles. The primary one encompassed the sun, the remainder had their centres in its circumference; and some of its intersections exhibited the splendour of the parhelion. Some of the circles almost equalled in their colours the brilliancy of the rainbow, a grand arch resembling which was also at the same time displayed in the opposite quarter. The other two instances occurred on the passage. The one when outward bound, April 14, 1807, latitude 64° or 65°, consisted of several parhelia, which, accompanied by coloured circles, and arcs of circles, and succeeded by a lunar halo, together with the aurora borealis, proved the harbinger of a tremendous tempest. The last phenomenon of this kind which I saw appeared on the passage homewards in 1811. It consisted of a large circle of luminous whiteness, passing through the centre of the sun in a direction nearly parallel to the horizon, intersected in various places with coloured circles of smaller dimensions. At two of the intersections of the coloured with the white circle, were exhibited brilliant parhelia of an irregular form."‡ Such are the singular and peculiarly striking phenomena which frequently occur in those dreary regions, which appear to have been set apart for the reign of eternal solitude; in the bare attempt to explore which, many of the most enterprising British navigators have only hazarded their lives to encounter greater and greater difficulties, until they arrived at length at insurmountable barriers to farther progress.

Paraselenæ, or mock moons, have been in like manner occasionally seen, and are certainly not less interesting. Hevelius, in the year 1660, described several of such at Dantzic. On the 1st of December 1819, many were observed by Captain Parry, at the dis-

* From "Two Years and a Half in the American Navy." London, Bentley.

† American Journal, vol. xxi. p. 189.

‡ Scoresby's Account of the Arctic Regions, p. 392.

tance of 21½° from the moon. One of them was close to the horizon; another perpendicularly above it; other two on a line parallel to the horizon. "Their shape was like that of a comet, the tail being from the moon. The side towards the moon was of a light orange colour. During the existence of these mock moons, a halo or luminous ring appeared round the moon, and passed through all the mock moons, at which instant two yellowish-coloured lines joined the opposite mock moons, and formed four quadrants, bisecting each other at the centre of the circle. These appearances varied in brightness, and continued above an hour."* Many similar instances of such phenomena might be cited, but the truth is, that all descriptions, however correct, must be inadequate to convey the actual impressions such appearances excite. The aspect of the heavens, under the most common and frequent circumstances, to a contemplative mind, gives rise to the most serious and elevated reflections; but when the sun and moon seem to change their wonted colours—when halos or glories unlooked for break around and encircle them—when the sun and moon are reflected in false images amidst the bright and dazzling exhibition of other extraordinary phenomena, mankind naturally pause to gaze and wonder; the philosopher, admiring not less the effect, examines into the causes of the apparent prodigy; while the ignorant spectator, "planet-stricken" by the first survey, turns within himself to yield only to the suggestions of an ignorant and delusive imagination.

The truth is, that all philosophical investigations, even into the most strange and eccentric phenomena of nature, while they enlarge our ideas, and reconcile us to, at first sight, singular anomalies, inspire us with a stronger and higher confidence in the wisdom manifested throughout creation; for who, as a "poor child of doubt, whose hope is built on reeds," can walk with confidence through paths along which every successive step plunges into deeper and deeper darkness? We naturally, after surveying the appearances and the effects of such phenomena, are anxious to examine into the causes by which they are produced; and it will, as a general principle, be found that the most apparently complex ends are generally by Nature effected by the simplest means. Here we find no difficulty. Already it has been explained how the intervention of a cloud, or any modification of invisible vapour, may reflect entire, or break down into its elementary rays, the white light proceeding either from the sun or moon, and to this we owe the appearance of such halos, parhelia, or paraselenæ. In a former article in this series,† we explained wherefore a very intense degree of cold always exists in the higher regions of the atmosphere; and this, aggravated by the cold which is produced in wintry seasons, occasions minute angular pieces of ice to float in the higher strata of the air, which refract in all directions the rays of the sun or moon. "The production of halos (says Sir David Brewster) may be illustrated experimentally by crystallising various salts upon plates of glass, and looking through the plates at a candle; when the crystals are granular, they will produce the finest effects. A few drops of saturated solution of alum, for example, spread over a plate of glass, so as to crystallise quickly, will cover it with an imperfect crust, consisting of flat octahedral (eight sided) crystals, scarcely visible to the eye. When the observer, with his eye placed close behind the smooth side of the glass plate, looks through it at a luminous body, he will perceive three fine halos at different distances encircling the source of light."‡ That such crystals of ice, analogous to the crystals formed by the alum on the glass, exist disseminated through the atmosphere, there is no doubt; and that, owing to their angular forms, they will refract the rays of the sun and moon round them, is equally obvious. Accordingly, the existence of such particles of ice in the atmosphere, at the time when such halos occur, must be expected, and, should such be concomitant, will render the explanation perfectly satisfactory. In the arctic regions, the existence of such particles of ice floating about in the atmosphere is proved by the sense of touch, by their pricking the skin like needles, and raising blisters on the face and hands; and at these very times, such halos, parhelia, and paraselenæ, are of most frequent occurrence. In winter, when such frost-smoke occurs, these phenomena are often seen; but in summer, when this does not occur, such halos and mock suns and moons are seldom visible. In the temperate regions, such appearances only arise during the colder months of the year, when such crystals of ice exist in the higher regions of the air, and are not observed during summer. Lastly, halos, properly so called, seldom or never occur in the torrid zone, where such crystals of ice are less likely to occur than in the temperate regions. Accordingly, without entering into any minute account of the speculations which have been broached concerning the minute forms of the prisms of ice necessary to produce modifications in the extent and character of these halos, we may conclude this article, proposing to consider in our next the appearances and causes of other luminous meteors, the consideration of which we hope will not be unacceptable to the readers of the Journal, with whom it has been our wish to traverse the paths of science, not as a task or heavy labour, but as a recreation from graver pursuits, saying, with the immortal Milton,

> "How charming is divine philosophy!
> Not harsh and crabbed, as dull fools suppose
> But musical, as is Apollo's lute,
> And a perpetual feast of nectared sweets,
> Where no crude surfeit reigns."

* Parry, *Op. Cit.*

IMPRISONMENT OF AUTHORS.

[By D'Israeli.]

Imprisonment has not always disturbed the man of letters in the progress of his studies, but often unquestionably has greatly promoted them.

In prison, Boethius composed his work on the Consolations of Philosophy; and Grotius wrote his Commentary on Saint Matthew, with other works: the detail of his allotment of time to different studies, during his confinement, is very instructive.

Buchanan, in the dungeon of a monastery in Portugal, composed his excellent Paraphrases of the Psalms of David.

Cervantes composed the most agreeable book in the Spanish language during his captivity in Barbary.

Fleta, a well-known law production, was written by a person confined in the Fleet for debt: the name of the *place*, though not that of the *author*, has thus been preserved; and another work, "Fleta Minor, or the Laws of Art and Nature in knowing the Bodies of Metals, &c., by Sir John Pettus, 1683;" who gave it this title from the circumstance of his having translated it from the German during his confinement in this prison.

Louis the Twelfth, when Duke of Orleans, was long imprisoned in the Tower of Bourges, applying himself to his studies, which he had hitherto neglected: he became, in consequence, an enlightened monarch.

Margaret, queen of Henry the Fourth, king of France, confined in the Louvre, pursued very warmly the studies of elegant literature, and composed a very skilful apology for the irregularities of her conduct.

Charles the First, during his cruel confinement at Holmsby, wrote the Eikon Basilike, *The Royal Image*, addressed to his son; this work has, however, been attributed by his enemies to Dr Gauden, who was incapable of writing the book, though not of disowning it.

Queen Elizabeth, while confined by her sister Mary, wrote several poems, which we do not find she ever could equal after her enlargement: and it is said Mary Queen of Scots, during her long imprisonment by Elizabeth, produced many pleasing poetic compositions.

Sir Walter Raleigh's unfinished History of the World, which leaves us to regret that later ages had not been celebrated by his sublime eloquence, was the fruits of eleven years of imprisonment. It was written for the use of Prince Henry, as he and Dallington, who also wrote "Aphorisms" for the same prince, have told us; the prince looked over the manuscript. Of Raleigh it is observed, to employ the language of Hume, "They were struck with the extensive genius of the man, who, being educated amidst naval and military enterprises, had surpassed, in the pursuits of literature, even those of the most recluse and sedentary lives: and they admired his unbroken magnanimity, which at his age, and under his circumstances, could engage him to undertake and execute so great a work as his History of the World." He was, however, assisted in this great work by the learning of several eminent persons; a circumstance which has not been noticed.

The plan of the *Henriade* was sketched, and the greater part composed, by Voltaire, during his imprisonment in the Bastile; and "the Pilgrim's Progress" of Bunyan was produced in a similar situation.

Howel, the author of "Familiar Letters," wrote the chief part of them, and almost all his other works, during his long confinement in the Fleet prison: he employed his fertile pen for subsistence, and in all his books we find much entertainment.

Lydiat, while confined in the King's Bench for debt, wrote his Annotations on the Parian Chronicle, which were first published by Prideaux. This was that learned scholar whom Johnson alludes to: an allusion not known to Boswell and others.

Freret, when imprisoned in the Bastile, was permitted only to have Bayle for his companion. His dictionary was always before him, and his principles were got by heart. To this circumstance we owe his works, animated by all the powers of scepticism.

Sir William Davenant finished his poem of Gondibert during his confinement by the rebels in Carisbroke Castle.

De Foe, when imprisoned in Newgate for a political pamphlet, began his Review; a periodical paper, which was extended to nine thick volumes in quarto, and it has been supposed served as the model of the celebrated papers of Steele. There he also composed his Jure Divino.

Wicquefort's curious work on "Ambassadors" is dated from his prison, where he had been confined for state affairs. He softened the rigour of those heavy hours by several historical works.

One of the most interesting facts of this kind is the fate of an Italian scholar, of the name of Maggi. Early addicted to the study of the sciences, and particularly to the mathematics and military architecture, he defended Famagusta, besieged by the Turks, by inventing machines which destroyed their works. When that city was taken in 1571, they pillaged his library, and carried him away in chains. Now a slave, after his daily labours he amused a great part of his nights by literary compositions; *De Tintinnabulis*, on Bells, a treatise still read by the curious, was actually composed by him when a slave in Turkey, without any other resource than the erudition of his own memory, and the genius of which adversity could not deprive him.—*Curiosities of Literature.*

MONKEYS.

In a course of lectures on natural history, by M Geoffroy Saint-Hilare, recently published, it it stated that monkeys are susceptible of *ennui*. A celebrated philosopher of the last century, who was certainly much more of a man of talents than of a natural philosopher, pretended, in the first instance, that to his hands alone man was indebted for his superiority over other animals. It was objected to Helvetius, that monkeys, having four hands instead of two, ought, according to him, to be much superior to man in intelligence. But he replied that monkeys, kept by the disposition of their bodies in perpetual motion, were not susceptible of *ennui*—one of the principles, in his opinion, of human perfectibility. Helvetius would see in M. Geoffroy's work, that in this supposition he was again in error; and besides, that the organization of monkeys differs in so many important respects from that of man, that it is manifest the monkey species must for ever be at an infinite distance from the human. One curious fact, and which alone would determine that question, is, that it has been ascertained that the young monkey is much more intelligent than the adult. By a remarkable law of nature, the more the physical strength of the monkey increases, the more its intellectual power diminishes.

PLAINS OF TROY.

The plains of Troy, so famed and flourishing in ancient days, are now barren and desolate. The sculptor sees no statues, the architect no remains, and the painter any thing but a picturesque view. It is fit only for the collegian or the moralist. The classic Scamander is but a muddy stream, winding through an uncultivated plain, covered with stunted oaks, underwood, and rushes. At the opposite extremity of the plain stand the tombs of Hector and Achilles, that of the latter near the Hellespont, where the Greek fleet was moored. Near is the grave of his friend Patroclus. All their glories are now reduced to a few *tumuli*, about 30 feet high. The Scamander is between 200 and 250 feet broad, and very muddy, having the appearance of being much flooded. Farther up the plain its course becomes undistinguishable among the marshes. After passing a smaller river, you arrive at an ancient *tumulus*, not far from the shore. What is most striking in this monument is the existence of an arch, which forms an entrance to the centre. Above are the remains of a square basement, on which the column of the tomb may have formerly stood. On your return you see the tombs of Achilles and Patroclus, and some others.—*Webster's Travels.*

POETRY.

[The following poems are not only entitled, from their merit, to appear in this or any other periodical work, but they further bear a value in the light of intellectual curiosities. They are the composition of a young lady, *aged only thirteen years*, the daughter of a respectable writer to the signet in town.—*Ed. C. E. J.*]

SHE NEVER TOLD HER LOVE.

Oh, no! she never told her love, nor dreamt that mortal knew
What made that once bright cheek so pale, and dimmed those eyes of blue;
Or what unbidden bade the tear from those bright eyes to flow—
She hid her sorrow in her heart; but was it hid? Ah, no!

For oft the blushing cheek would tell, the quivering lip reveal,
What in her young, o'erburdened heart, she struggled to conceal.
They saw her slender graceful form grow thinner every day;
They marked the smile upon her cheek, like sunshine, pass away.

And, like a worm within the bud, love on her cheek did prey,
Till rest forsook her sleepless couch, and peace her thoughts by day;
And wand'ring reason almost fled, and left her fallen throne;
And grief grew weary of its tears, and love itself was gone.

But yet she ne'er confessed her grief, nor whispered to the air
The passion of a slighted love, the cause of all her care.
Guiltless she lived, yet lonely died, for none could soothe her woe—
She sleeps where wildflowers sadly wave, where sighing breezes blow.

SONG.

Oh, mark yon little bounding bark,
That skims along the main!
Ye roaring waves, be merciful—
Return it safe again.

And blow, ye breezes, gently blow,
And waft it to the shore;
For one young heart would break with woe,
Should it return no more.

A fair one stands at her lattice high,
And she sees it come in sight;
Her heart beats as it ventures nigh,
And she watches with delight.

Her lover's in yon little bark,
That rises with the foam;
Then, gently blow, ye vernal gales,
And waft the sailor home.

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, John Macleod, 20, Argyle Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by William Orr, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company Paul's Work.

TOWN AND COUNTRY.

TOWN and country people think in a manner essentially different from each other. Their habits—their pursuits—the whole scenery and circumstances of their lives, are different; and hence arises the distinction between their sentiments. Though these two orders of beings are only fulfilling, each in their own way, a part of the general scheme of mutual utility; though the country is, as it were, the grazier, and the town the cook—the country the forester and the town the carpenter—the country the grower and the town the seller—yet it is curious to see what odd jealousies and invidiousnesses prevail between them. Country people, visiting the town, are sometimes observed to be extravagantly resolute against the weakness of confessing any admiration of the grandeur and fashionable fopperies of the town—though it is quite certain that every ruralist on earth looks either to a Mantua or a Rome of his own, as the grand arbiter of fashion and instructor in manners. In Scotland, all the Lothians, Fife, and the border counties, regard Edinburgh as the fountain and centre of any thing *fine:* all Ayrshire, Lanarkshire, and thereabouts, looks to Glasgow. About Galloway, they have a prostrate admiration of Dumfries; and over the Tay, Aberdeen is the cynosure of all neighbouring eyes, except it be a few near Inverness. But yet, when the provincialist comes to his respective capital, watch him as you will, he will not say any thing admiring of it, unless perhaps there be an Englishman in company. They compare every thing disparagingly with the green hills and shining streams, upon which they have been accustomed to look at home. Nay, the country folk will tell you that they perceive the air of the town as soon as they come within a mile or two of it, and are like to die of suffocation till they get out of it again. Every thing, they say, in the way of food, is inferior there, not being raised from the natural pith of the earth, but from wretched chemical forcings; the big buildings are only *big;* all the gentlemen are lawyers, that suck honest men's blood; and the more common-looking people are pickpockets. In fact, all the time that an honest countryman is in town, he is in a state of mingled scorn, terror, and distrust. He walks about the pavement (which hurts his feet dreadfully, because of its wanting the agreeable roughness and tenacity of a country road), glaring with an inapt, foreign, curious look at every window and sign, and evidently labouring under an idea that scores of people are hovering around him in all directions, to play him some mischief, if they can but catch him off his guard. He complains terribly of the distance from one friend's residence to another, as if he were not accustomed to go three times the diameter of the town occasionally to see a neighbour. And whether he "stays" in a hotel, or "puts up" in a humble inn, it is all one—he is in a perfect agony to be gone. He only takes care first to buy a shawl for his wife, and a few mimic guns, fiddles, and picture-books, for his children—"for they always expect something," he affectionately remarks—and then back he flies to his rustic solitude.

It is curious, on the other hand, to remark the correspondently strange notions of a city-immured person respecting the country. Almost all know a little of it—but only a little. If they know little, they care less. It is only about the month of July, that, for the first time in the year, you begin to hear the city folk talk of the country. They then suddenly pluck up a kind of tender interest in the welfare of that neglected part of the world—something akin to the concern which one has about a woman about to add to the numbers of the human race. They begin to be anxious about the harvest, upon which they know (for they do know this much) a great deal of their own comfort for the next year depends. You then hear one person say to another, as they pause to shake hands on the street, "Capital weather this for the country!—The wheat must be ripening very fast." Or else, if three people meet under some shelter to shun a shower, it is—"Very severe plump this—very good, though, for the country—shower much wanted." About this time, indeed, the town people become quite magnanimous in the cause of the country. If they only can convince themselves that a shower will do any good elsewhere, they will endure bucketfulls on their own persons with the greatest fortitude and patience. The agricultural interest is not at all aware of the real depth of concern which the commercial world takes in their business at this time—what kind inquiries are made after the prospects of the season—what fond wishes are breathed for propitious weather—what anxiety is expressed about the progress of the harvest! If any man has been a few miles out of town, and can tell something of the appearance of the fields, the hum at a dinner-party subsides in order to hear what he is saying to a gentleman across the table, respecting what he has seen out of doors. "A field of barley cut down, sir, last Wednesday, at Ceres, in Fife [most appropriate locality for such a wonder]—the first of the season—reaping expected to be very general next week. All owing to the fine weather in May. Farmers say they have not known a heavier crop since the ninety-six. New oats are expected at Dalkeith market on Thursday." And then every man eats his dinner with a gratulatory relish, springing from the assurance that "things are all well in the country." Even among humble artizans, who hardly ever see ten inches of blue sky, an interest of a most profound character is felt respecting the harvest; and it is amazing how well they are acquainted with the technical provincial phrases appropriate to the subject. The measure and price of meal is to them a matter of the keenest and most immediate interest; and they are political economists enough to know how intimately that matter is connected with the appearance of the fields in July. It is amusing, sometimes, about seven o'clock on a summer morning, to see perhaps a couple of old red-cowled men—shoemakers, perhaps, or small shopkeepers—taking a stroll with their hands in their pockets under their aprons, about three hundred yards out of town, where, amidst the villas of the suburbs, there may flourish a mere remnant of a field covered with growing barley;—they inspect this with a calculating air, and have their own unprofessional remarks on its appearance. And then they come back to town, and talk for a week about the crops. Or on a summer Sunday evening, when all the fashionable, and even what is called the respectable world, keeps haughtily within doors, how delightful it is to see the honest mechanic taking a stroll in some of the highways or byeways a little way out of town, along with his wife and perhaps one or two of his children! His clothes are decent, though perhaps deficient in *expression*, and still marked with the creases incurred in their ordinary-day sinecurism. He probably carries his youngest child in his arms, while the wife sails on broad and large in a red shawl in front, attended by a few walking youngsters, who are ever and anon asking her questions about some rural object that strikes their eyes for the first time. It is about six o'clock; and though the house is deserted and locked up, the kettle has been left very near the smothered fire, so as to be ready, when they return, for the infusion of the tea, which is destined to conclude the day's humble and well-earned enjoyments. As he moves along, with his arms clasped close round his little one, and the back of his coat swinging loose and free of his back, he prattles with his straggling family group about all the cows, and the horses, and the farm-yards, they come in sight of; and ever and anon he takes an interested and knowing look at the oat fields, as if he saw in them the shadow of his coming pottage, and wondered what meal would cost next year per peck. If the weather be clear, with the sun shining over-head, then he rejoices, for two reasons—it is pleasant for a walk, and it promises to "do good to the country." If a shower comes on, it discomposes him and his family not a little, and drives them, a little draggled perhaps, into the next public-house; yet he suffers all with a good grace and a resigned heart—"it may perhaps be of service to the country." If in passing along he sees a boy intruding upon a field of grain, for the purpose of plucking and bruising a few ears, he cries to him in an authoritative tone of voice, to come out of "the victual;" this last phrase being the one which he is disposed to apply to grain, when he wants to treat it with more than usual respect. Whenever the group comes to a place where the enclosing fences are somewhat lofty, then has he to lift up his children one by one, that they may look over and see what they can see. The wife occasionally asks questions about the neighbouring seats, and, in talking of these unusual matters, a style of speech steals unconsciously upon the worthy couple, which is considerably different in tone and language from what they use at home on the week-days. They feel somewhat like civil strangers, in a higher rank of life, explaining things to each other in an urbane and genteel kind of manner; and it is not till they reach home, and recommence household realities, that they become exactly as familiar as they usually are with each other.

It is the most ridiculous thing in the world to institute invidious comparisons between the country and the town, or to say that the balance of advantage lies on either side. Cowper's celebrated line is a fallacy.* Much of both the country and the town is the creation of the Almighty, and much of both is the creation, in a certain sense, of man. The fields are rendered by man very different from what they were originally; and though his handiwork is more observable in the city, still there is only a difference in degree. The institutions of social life prevail in both town and country; and though there is perhaps more sophistication in the latter, still that too is only a difference in degree. If we concede that social life was intended as the proper condition of man, we must allow that the clustering of certain of the race in cities must have been as expressly contemplated from the first, as the dispersion of others over the face of nature—for the existence of masses of population is a necessary consequence of social life. In this, as in every thing else, man has his choice. If he prefers the air and sights of the sweet-breathed country to the conventional conveniences of a city, he is right for himself and for his kind. If he prefers these conventional conveniences, at the expense of some of the said air and sights, then he is right too. For by either way the general good is advanced. In short, we would like to see all sorts of people removed above inconsiderate prejudices respecting the lot and choice of their neighbours. Even to *wonder* how another man lives, wanting the things which *you* appreciate in your own destiny, shows an absence of proper reflection, and would be as well avoided. No man can know what happiness there is in the condition of his fellow-men, unless he put himself into the same situation. Then

* "God made the country, but man made the town."

he is apt to find, that, in the sphere and caste where he formerly thought there was nothing but unmingled misery, there exist many unseen comforts and blessings, which redeem its outward aspect.

THE YOUNG CHEMIST.—No. III.

That there are likings and dislikings among the inanimate particles of matter, may appear strange, yet, nevertheless, it is true. Boys like the amusements of a holiday better than their school tasks, plum-pudding better than porridge; and some one of their companions they will keep company with, play with, and fight for, in preference to all the others. Men have their likings and dislikings, too, and women no less so; in short, this is one of the universal laws of nature. Now, there are several ways in which matter shows this fellowship, and these have been distinguished as different kinds of *attraction*. Thus, if a stone is thrown up into the air, it immediately descends again to the earth; if it is taken up the slope of a high mountain, and allowed its own liberty, it will immediately roll down into the lowest part of the plain; in fact, it has a tendency or inclination always to draw as near as possible to the earth's centre. And this is the case with all bodies or masses of matter on the surface of the globe; they are continually subject to a law which draws them to the earth's centre. Thus, too, the earth itself, and the other planets, are drawn in a circle round the great centre of attraction and gravity, the sun. If you take two small thin cut pieces of cork, and place them on the surface of a glass of water, you will find, that, whenever they are put within an inch or half an inch of each other, they will rush together, and adhere or stick so that we may lead about both by dragging one forward with the point of a pin; this shows you that this kind of attraction acts when the substances are at a distance. There is another kind of attraction called *cohesive*. Thus, if you take two small drops or globules of quicksilver, and place them on a smooth piece of paper or table, so that they touch each other, they will immediately join, and become one; but if you take one globule of the same, and a small bit of iron or steel, and put them in the same way in contact, they will not adhere together. Two drops of water on a cabbage-leaf will readily run into each other, and become one; but a drop of water and a drop of oil will refuse to do so. This cohesive attraction, then, takes place only among the particles of the same body, and it is by this law that masses of stone, or iron, or mercury, or water, always keep together. It is by this law, too, that the particles of bodies arrange themselves in those beautiful forms called crystals. Thus, if as much sugar be put into boiling water as it will dissolve, and if the boiling be continued for some time, and then the vessel with its contents laid aside to cool slowly, the particles of the sugar will arrange themselves into forms all of one particular shape, and produce the well-known substance sugar-candy, or crystals of sugar. Our table-salt is also an instance of crystallization, and alum and Epsom salts are examples of the same. We often see in a severe frost in winter the window-panes beautifully ornamented with tree-like figures; this is the moisture or water in the air which has been slowly frozen, and which has thus assumed various figures as its crystals were successively formed. An elegant specimen of crystallization may also be made in the following manner:—Take a common phial with a pretty wide mouth, and put into it about a drachm of sugar of lead (acetate of lead); fill up the phial with water, and shake it to dissolve the powder; then take a small piece of the metal zinc, to be got at any coppersmith's shop; tie a thread round it, the ends of which are to be drawn through a hole made in the cork, so as to suspend the zinc in the phial about an inch from the top; lay the phial aside; and in the course of a few hours a substance like metallic leaves will be found hanging in clusters from the zinc. These leaves are the crystals of lead which have been separated from the acid, which acid has combined with the zinc, for which it had a greater liking or affinity. And this leads us to speak of a third kind of attraction, called chemical affinity. When certain bodies are brought close to each other, or mixed, a chemical action takes place—they unite, but in doing so a substance is formed different from either of the originals. All bodies, however, will not thus mix together; and sometimes when two refuse to unite, on the introduction of a third they will all join in cordial union. Thus, if you take a little oil and a little water, and shake them together in a glass, they will not combine; the mixture, it is true, will get turbid, but on laying it aside for a few minutes, the oil will be found floating above, and the water lying sullenly below; but if to these substances thus in the sulks you add a few drops of strong ammonia, or a little soda or potass, and then shake them, the whole will form a white thickish mixture, which will be in fact a liquid soap. Before this law of chemical attraction acts, it is necessary that the substances should be brought close together; and thus it is different from the attraction of gravity, which, as we have seen, acts at a distance, and when bodies are far asunder. Nay, it is not only necessary that they should be in close contact, but in many cases very close, or rubbed hard together. Thus, if you take a small quantity of flour of sulphur, and an equal portion of chlorate of potass (a few grains of each), and simply mix them together, no action or union takes place; but if you put these into a mortar, and rub them smartly with the pestle (taking care to have the hand protected with a glove), they will explode with a crackling noise; here the friction has brought the particles of each into close contact. In order that chemical action may take place, it is also in most cases necessary that one or both of the substances be fluid. Thus, if you mix a little of the powder of nitre and flour of sulphur, no change or mixture ensues; but if you melt the nitre over the fire, and then add the sulphur, a bright flame is instantly produced. If from a box of common soda-water powders you take a paper of the blue and a paper of the white kind, and mix them, while dry there is no action; but if you throw this mixture into a glass of water, a violent effervescence takes place. Here both substances become liquid, and the acid of the one powder combines with the soda of the other, while the fixed air, or carbonic acid gas, is set at liberty, and causes the numerous air-bubbles. Heat also very much assists chemical action: many substances that will not mix in cold water readily combine when the water is made to boil. If you take a glass flask, and put into it an ounce of spirit of wine, and a third of an ounce of aquafortis (nitric acid), weakened with two-thirds of water, nothing will take place; but, on applying the slight heat of a spirit lamp below, a gas or air will be disengaged, which will take fire on the approach of a lighted candle. On putting the flask into cold water, the action is stopped; on applying heat again, it is renewed. But perhaps the most singular circumstance connected with chemical attraction is the fact alluded to at the commencement of this subject, that certain bodies have such a strong affinity or inclination for each other, that they will rush together and unite under every favourable circumstance; nay, that some individual matters will cleave to each other, though both at the time are in intimate union with other substances. Thus, in the case of the soda powders above alluded to, in one powder we have two substances, soda and carbonic acid, which have a strong affinity for each other, and in ordinary circumstances remain combined together apparently the best of friends; but no sooner does the soda meet with the tartaric acid of the other powder, than it instantly leaves the carbonic, and unites with the tartaric, for which it has a stronger affinity. Changes of this kind can be illustrated, in many substances, half a dozen of times in succession. Thus, sulphuric acid readily combines with ammonia or hartshorn; if you add a little lime, it flies to this, and leaves the ammonia; add soda, and it leaves the lime; potass, and it leaves the soda; strontia, and it leaves the potass; and, in preference to all, if the earth baryta be added, it will cleave to this. If you add two or three compound substances of different properties, you have then a regular country dance of it, cross hands and up the middle, hubbub and confusion prevail, till at last a complete change of partners takes place, and every substance will be found in the end closely joined to that which it likes best. The investigation of these changes, these likings and rejections, constitutes the great charm of chemistry, and it also constitutes its great and important use in the arts. By knowing these affinities of bodies, one can frequently obtain out of a useless mixture some valuable substance; by combining two useless substances, a third of great importance may be obtained; by simply putting in a few drops of a certain substance into a mass of others, one can distinguish the nature of some or all the substances of the mixture hitherto unknown; in short, the improvements in the arts, in every thing that regards the comfort, and elegance, and health of modern civilization, has mainly depended on the perfection of these chemical discoveries. We have still another circumstance to mention with regard to the union of bodies. Some unite apparently in any proportion in which they happen to come together, while others will only unite in certain fixed quantities. Thus, if you have a phial, containing a quantity of water, you may drop a few drops of sulphuric acid into this, and it will readily diffuse itself through the whole, and impart its peculiar acid taste: you may still continue to drop in more of the acid, and still the water will unite with it, and become stronger and stronger; in fact, there is no limit to their mixture. But if you take the same quantity of water, and put into it a small quantity of table-salt, a certain portion of this salt will be readily dissolved, until you come to a point where the water will take up no more; the excess falls to the bottom untouched or unaltered. All salts, and indeed all substances (with the exception of fluids just mentioned, and in these, circumstances may prevent the rule from being apparent), seem to have certain proportions in which they unite with each other, and which proportions they never vary. It is from these innumerable combinations in various measures and degrees, that all the vast variety of substances on the earth are formed; and however numerous and different in their properties these may be, yet, as has been shown in No. I., all are compounded out of some two or more of fifty-four simple or elementary bodies existing in nature. Thousands of chemical changes are continually going on around us, bringing about a never-ending change on the face of all things; so that the earth is one vast chemical laboratory, where operations of the most stupendous magnitude are daily performing.

Thus, a continual distillation takes place from the sea, and fresh water is separated from its salts, which, descending in rain, feeds vegetation, and affords springs and rivers for the benefit of man and animals. Then the vegetable world extracts the salts of the earth, and combines the air of the atmosphere with their juices, affording food for myriads of animals. The superfluous vegetation decays, or is decomposed into earth and air, affording a soil and juice for the growth of other plants; and man and animals, after having performed their allotted part, are also reduced by a chemical change into their parent dust. If we add to this the decomposition of wood, and coals, which have once been wood, by burning in the fire, whereby their ingredients are changed, but not a particle of them lost, we shall complete the circle of changes and transformations which are daily and hourly going on in the animal, vegetable, and mineral kingdoms, where, although much appears to be wasted and dissipated, yet such is the accurate and careful details of nature, that it is highly probable the whole sum of matter composing the earth is neither one grain more nor one grain less than what it was at the period when it first came forth from the forming hands of an Omnipotent Creator.

SAM SPRITSAIL.

"Mayhap you didn't know Sam, one of the worthiest tars that ever handled a marlin-spike, or took his trick at the helm. Many's the time we have spun our yarns together, shared each other's 'bacca, or fought at the same gun; and tell me what can bind the ties of kindred stronger?

One day (shortly after the mutiny at Spithead) we were cruising off Brest, and it came on to blow a stiff breeze from the north-west; so the hands were turned up to reef topsails. Now, we had always been considered the smartest ship in the fleet, and the topmen prided themselves on beating every one else, so they were at all times eager to get to their stations. Sam, in hurrying up the hatchway, happened to come in contact with a young midshipman that had scarce ever dipped his hands in salt water, or bit the mark out of a king's biscuit, and nearly capsized him. It warn't done intentionally; but the small officer, without hesitation, struck him a blow; and though it didn't hurt him much, yet his feelings were wounded, and that to Sam was worse than a broken limb. Howsomever, no time could be spared for parleying, for the gale was freshening; so he turned to the young gentleman, gave him a look of stern reproach, and shinned away aloft like a sky-rocket. Well, d'ye see, after shortening sail, and the watch called, Sam was ordered aft on the quarter-deck; for the midshipman, not content with striking him, had also complained to the first lieutenant (who had only joined us a few days before), charging him with mutinous conduct and insolence. "Indeed, sir," said Sam, "I couldn't help it—I didn't mean to offend Mr ——: it was all accidental, and I'm sorry for it." "What do you say to that, Mr ——?" said the lieutenant. "It was not an accident, sir," replied the midshipman, "but designedly done, for I saw him afterwards turn round and grin at me." "Grin! no, sir, I didn't grin. I certainly looked round, when Mr" —— here he paused, too proud to mention the blow—"but let it rest, let it rest." "No, my man," rejoined the lieutenant, "I shall not let it rest: the dregs of a mutinous spirit are still operating among you. Here, boatswain's mate, get a rope's-end, and give this fellow a starting." "That's hard, sir," said Sam: "I've always done my duty, and every officer in the ship would answer for me." "Silence, sir! not a word. Boatswain's mate, do your duty." But the poor fellow, who was a messmate of Sam's, fumbled so long, that the lieutenant gave him a rap on the head to freshen his way. By this time the men gathered round the gang-ways, and along the lee side of the deck, all wondering what was the matter; for they knew their shipmate to be the most peaceable obliging man on board, and the best seaman to boot; so whispers ran along, and doubtful looks, as if every one tried to read the other's thoughts. "Do your duty, boatswain's mate!" bellowed the lieutenant. Jack Hawser raised his arm, looked at his messmate (who stood firm as a rock, without betraying a single emotion of fear), and then dropped it again with an expressive shake of the head. The lieutenant now got into a violent passion, and, seizing the end of the top-gallant clew-line, laid it across Jack's shoulders. Again the rope's-end was raised; and Sam, seeing how matters stood, mildly told his messmate "to obey orders, and do his duty." "Lay it on!" roared the officer, observing Jack again hesitate; "lay it on the scoundrel; you're a set of mutinous dogs altogether." Jack was about to give the blow, impelled by the pain from the lieutenant's stripes, when, observing the calm, composed, yet pitying look of his messmate, he dashed the rope's-end on the deck, and, turning to the officer, exclaimed, "If I do, I'll be hanged." At this moment loud murmurs were heard amongst the men, who came pressing farther aft; but fortunately the next minute the captain walked out of his cabin, and finding the first lieutenant belabouring the boatswain's

mate, while the determined countenances of the crew threatened tumult, "Avast, avast, sir," he cried out, "what is all this? I'm sorry to see you in so degrading an office, sir. Pray, what has caused all this violence?" The ship's company were eagerly crowding on the quarter-deck; but their clamour immediately subsided when they heard the captain's voice. "Sir," replied the officer rather haughtily, "these men are mutinous;" loud murmurings arose among the people. "Silence, my men," thundered out the captain, erecting himself in the attitude of one determined to be obeyed: "the first I hear utter a word shall be instantly put in irons: if you are injured, I am here to do you justice." Then, turning to the officer, "Be more guarded in your expressions, sir, and let me know as briefly as possible what has occasioned this commotion." "This young gentleman, sir, brought me a complaint against one of the men, for wilfully running upon him so as nearly to knock him down, and for using insolent language." "Where is the man?" "Here, sir," pointing to Sam. "Who, this —this the man? why—but I must hear farther." So he questioned him about it, and Sam explained what had taken place, which was proved by the evidence of all who had witnessed the transaction. "But why, sir," addressing the lieutenant, "were you starting the boatswain's mate?" "Because, sir, he would not execute my orders, in punishing the man." "There he was wrong, for obedience in a seaman is the first test of duty. I honour him for his humanity and noble feeling, but he has my censure for disobedience of orders: however, as he has already suffered chastisement, I shall say no more. As for this man, sir," pointing to Sam, "I only wish that you, sir—yes, you—possessed a heart equally brave and honourable. This man, whom you have stigmatised, and would have punished unjustly, preserved this ship and the lives of her officers during the late insurrection at Spithead. 'Tis true, for the time being, the captain was deprived of his command, and this man elected by the delegates instead; but such was his excellent conduct in restraining the seamen from acts of violence, or even trivial insult, that the duty was carried on by the officers with the same attention as before; only, in one thing they were all determined, not to lift an anchor till their grievances were redressed; and perhaps—but that has been settled. Now, attend, sir, to what I am going to say: while the pendant is waving over our heads, bear in remembrance that I am captain of my own ship, nor will I suffer a hand to be raised against any of the people, unless through my directions." Some of the men began to cheer. "Silence, fore and aft, men; these cheers are disgusting to me, and I am highly displeased with your conduct. Have you ever found me regardless of your comforts or privileges, that you should thus assemble tumultuously together? But there are some among you on whom I shall have a bright eye, and therefore recommend them to keep a sharp look-out. Call the watch, boatswain's mate, and send the rest below."

As the calm frequently follows the tempest while the long-rolling waves are yet violently agitated, though the howling of the gale has ceased, so did the turbulence of the seamen subside, and, slowly quitting the deck, they scarcely raised their heads to look their commander in the face. Sam still stood by the "Jacob's ladder;" and after the captain had taken a few turns, he stopped before him. "As for you, my man," said he, "your attachment to your king and country in the hour of peril has not been forgotten; continue in the conscientious discharge of your duty, and no one here shall harm you; nay, more, when we return into port, I shall use my interest in getting you promoted." "God bless your honour," replied Sam; "I hope your honour don't want to get rid of me: I'd rather sail with you, sir, than be made a lord." "Well, well," returned the captain, "go to your duty now; we'll speak about it another time."

A few weeks after this the fleet put in to Torbay to water, and all the boats were busily engaged in going to and from the shore, while many of the officers made short excursions into the country. During this period the first lieutenant did not forget Sam, for, being left in command, he harassed him incessantly; but the poor fellow scorned to shrink, or even complain. He was a married man, too, and his wife (who resided with her parents between Torbay and Plymouth), not having seen him since the mutiny came alongside in a shore-boat, expecting to have an interview; but the commanding officer would not suffer her to come on board, alleging an order to that effect, which excluded women from the ship; so that poor Sam had only the cheerless satisfaction of passing a few minutes with her in the boat, vainly endeavouring to soften her anguish, and soothe her disappointment. All hands exclaimed loudly against this tyranny, and would most probably have proceeded to open resistance; but they remembered the late rebuke of their captain, and the remonstrances of Sam himself restrained them from open violence.

Well, d'ye see, we sailed again, and cruised to the westward in the chops of the Channel. One evening, just about dusk, blowing very hard, we sprung our bowsprit, and the first lieutenant came out upon it to see the extent of the injury. At this moment a cry was heard on the forecastle, "A man overboard, a man overboard!" but the gale was so strong, that it could not be heard aft. Sam, however, who was standing on the lee gangway, caught the sound; and, repeating it as loud as possible, sprung upon the hammock-nettings. The ship had very little way through the water; and every soul on deck crowded to the same spot, with the ends of ropes and other things to throw to the unfortunate swimmer; but he was nowhere to be seen. "Where is he?" exclaimed the captain, jumping by the side of Sam: "lower the quarter-boat down. Can you discern any thing of him?" Sam was silent; but his keen eye seemed resting on a particular eddy in the sea. "Where is the first lieutenant?" continued the captain; "why is he not aft here?" "'Tis Mr L—— that's overboard, sir," cried a dozen voices at once. "I see him, sir," said Sam, starting from that fixed attitude he had maintained; "I see him!" and instantly dashed into the waves. The dark body of the lieutenant was now plainly visible, as it emerged from the deep, and lay for a moment inanimate upon the white foam of the billows, while Sam, with his sinewy arms, was cleaving the liquid element, and throwing aside the spray. Before, however, he could reach the officer, the body began gradually to settle down again, and, when he reached the spot, was no longer to be seen. Breathless expectation sat on every countenance (for though all hands disliked him, yet sailors forget animosities in a time of trouble); but what was their surprise—what was their horror—when the brave fellow, who had so gallantly risked his life to rescue his bitterest foe, disappeared in an instant! The ship had now forged considerably a-head, and, owing to the confusion occasioned by the accident, the boat was some time in lowering down; but at last they shoved off, while every eye was anxiously strained in the direction where Sam and the lieutenant had last appeared. The heavy wave rolled on unburdened, displaying its lofty top, as if in triumph, crested with sparkling foam. "There he is!" exclaimed the captain, as the struggling seaman rose upon the hollow of the swell: "pull to starboard in the boat, and stretch out, my lads—stretch out." This latter was delivered through the speaking-trumpet;—the officer heard it—waved his hat, and, catching sight of Sam himself, steered directly for the spot. Hope glowed in every breast at the prospect of his deliverance; but transient was its ray. A mountain wave came curling its monstrous head, threatening destruction to the gallant little crew: it caught the boat, nearly filling her with water, and drove them past their object. Darkness now obscured them from our view; though now and then we could just discern amidst the gloom a black speck, as it rode on the top of the billow. Another boat was immediately manned; lights were hoisted, and false fires burned; but nearly an hour elapsed, and no cutters returned. The captain paced the poop in violent agitation, frequently stopping to make inquiries, and to look himself. At last, "Here's a boat upon the weather quarter," exclaimed a little midshipman; and immediately added, "There's two, sir—there's two—only look, there they both are! Hurrah, my lads: thank God! they're safe." In a few minutes more they rowed alongside. "Hand over a rope's end," cried the officer in the headmost boat, which was the first that had been sent away. The rope's end was handed over. "Some one must be hurt," said the humane surgeon, who stood ready to render his assistance. "I imagine so," returned the captain, "for I fear the poor fellow is lost. As for Mr L——, there cannot be the faintest hope: he has perished without doubt." While this conversation was passing, the men were occupied in carefully raising some one up the side; and just as the captain had finished his sentence, an apparently lifeless body was lifted over the gangway. "'Tis Mr L——," shouted the surgeon; "'tis my poor messmate!" and instantly sprung forward to assist in carrying him below. "Have you saved the man?" inquired the captain; but before his question could be answered, Sam appeared upon the deck. He staggered through exhaustion towards the captain, and fell senseless at his feet. "Carry this brave fellow into my cabin directly," cried the captain, raising him in his arms, "and send the surgeon's assistant here immediately." "I am here, sir," replied the young man; and, following them into the cabin, poor Sam was after some time recovered. The first lieutenant had been conveyed to the ward-room, and every exertion used for two hours, without showing the least symptoms of returning animation: at the expiration of that time his pulse returned; and in another hour he uttered some incoherent words, and sunk into a deep sleep.

Sam told his tale. When he first disappeared, finding he had missed his object, and trusting to his skill, he dived after the sinking officer. Catching him by the hair, he brought him to the surface; but the lieutenant was senseless, and Sam was compelled to let him go. Again he dived, and again brought him up, when the boat missed them, till, almost exhausted, his strength began to fail, and both were settling fast. Once more Sam quitted his hold, but he determined, as help seemed to be at hand, to make one desperate struggle. He again dived, and writhed his hand in the officer's hair. The effort was too much; and despair even of his own life darted upon Sam's mind—when, at this moment—at this very moment—before he had raised his head above the water, he felt his arm firmly grasped, and the next was hauled up to the bows of the boat, one of the men having thrown himself over for this purpose, while another held fast by his foot.

What need of saying more? Sam was made a boatswain, and now lays up in ordinary in Chatham river; while Mr L—— learned to temper "mercy with judgment," and became one of the best and most humane officers in the British navy."*

TRADITIONS OF THE OLD TOLBOOTH OF EDINBURGH.

[From Reekiana, by R. Chambers.]

CRIMINALS, notwithstanding every consideration of the meanness which characterises some crimes, and the wickedness and cruelty of others, are an interesting portion of mankind. The interest respecting them is not confined to the young ladies, who conceive that "the youth in his cart has the air of a lord," and

—— "cry, there dies an Adonis."

It is felt by all mankind. The reasons are, that criminals become distinguished and notable above their fellow-creatures—singled out, as it were, and placed in a conspicuous flock, with a pale around them, which the ordinary people of the world will not, dare not overleap. They are interesting, often, on account of their courage—on account of their having dared something which we timorously and anxiously avoid. A murderer or a robber is quite as remarkable a person, for this reason, as a soldier who has braved some flesh-shaking danger. He must have given way to some excessive passion; and all who have ever been transported beyond the bounds of reason by the violence of any passion whatever, generally gain the wonder, if not the admiration, of the rest of the species. Among the inmates of the Old Tolbooth, some of whom had inhabited it for many years, there were preserved a few legendary particulars respecting criminals of distinction, who had formerly been within its walls.

One of the most distinguished traits in the character of the Old Tolbooth was, that it had no power of retention over people of quality. It had something like that faculty which Falstaff attributes to the lion and himself—of knowing men who ought to be respected on account of their rank. Almost every criminal of more than the ordinary rank ever yet confined in it, somehow or other contrived to get free An insane peer, who, about the time of the Union, assassinated a schoolmaster that had married a girl to whom he had paid improper addresses, escaped while under sentence of death. I am uncertain whether the following curious fact, related to me some years ago by Sir Walter Scott, refers to that nobleman, or to some other titled offender. It was contrived that the prisoner should be conveyed out of the Tolbooth in a trunk, and carried by a porter to Leith, where some sailors were to be ready with a boat to take him aboard a vessel about to leave Scotland. The plot succeeded so far as the escape from jail was concerned, but was knocked on the head by an unlucky and most ridiculous accident. It so happened that the porter, in arranging the trunk upon his back, placed the end which corresponded with the feet of the prisoner *uppermost*. The head of the unfortunate nobleman was therefore pressed against the lower end of the box, and had to sustain the weight of the whole body. The posture was the most uneasy imaginable. Yet life was preferable to ease. He permitted himself to be taken away. The porter trudged along the Krames with the trunk, quite unconscious of its contents, and soon reached the High Street, which he also traversed. On gaining the Netherbow, he met an acquaintance, who asked him where he was going with that large burden. To Leith, was the answer. The other inquired if the job was good enough to afford a potation before proceeding farther upon so long a journey. This being replied to in the affirmative, and the carrier of the box feeling in his throat the philosophy of his friend's inquiry, it was agreed that they should adjourn to a neighbouring tavern. Meanwhile, the third party, whose inclinations had not been consulted in this arrangement, felt in his neck the agony of ten thousand decapitations, and almost wished that it were at once well over with him in the Grassmarket. But his agonies were not destined to be of long duration. The porter, in depositing him upon the causeway, happened to make the end of the trunk come down with such precipitation, that, unable to bear it any longer, the prisoner fairly roared out, and immediately after fainted. The consternation of the porter, on hearing a noise from his burden, was of course excessive; but he soon acquired presence of mind enough to conceive the occasion. He proceeded to unloose and to burst open the trunk, when the hapless nobleman was discovered in a state of insensibility; as a crowd collected immediately, and the city-guard were not long in coming forward, there was of course no further chance of escape. The prisoner did not eventually recover from his swoon till he had been safely deposited in his old quarters; but, if I recollect rightly, he eventually escaped in another way.

In two very extraordinary instances, an escape from justice has, strange as it may appear, been effected by *means* of the Old Tolbooth. At the discovery of the Rye-house Plot, in the reign of Charles the Second, the notorious Robert Fergusson, usually styled "the Plotter," was searched for in Edinburgh, with a view to his being subjected, if possible, to the extreme vengeance of the law. It being known almost certainly that he was in town, the authorities shut the gates, and calculated securely upon having him safe within their toils. The Plotter, however, by an expedient

* Abridged from "Greenwich Hospital, a Series of Naval Sketches." Robins, London. 1826.

worthy of his ingenious character, escaped by taking refuge in the Old Tolbooth. A friend of his happened to be confined there at the time, and was able to afford protection and concealment to Fergusson, who, at his leisure, came abroad, and betook himself to a still safer shelter on the Continent. The same device was practised in 1746, by a gentleman who had been concerned in the rebellion, and for whom a hot search had been carried on in the Highlands.

The case of Katherine Nairne, in 1766, excited, in no small degree, the attention of the Scottish public. This lady was allied, both by blood and marriage, to some highly respectable families. Her crime was the double one of poisoning her husband, and having an intrigue with his brother, who was her associate in the murder. On her arrival at Leith in an open boat, her whole bearing betrayed so much levity, or was so different from what had been expected, that the mob raised a general cry of indignation, and were on the point of stoning her, when she was with some difficulty rescued from their hands by the public authorities. In this case the Old Tolbooth found itself, as usual, incapable of retaining a culprit of condition. Sentence had been delayed by the judges on account of her pregnancy. The midwife employed at her accouchement (who continued to practise in Edinburgh so lately as the year 1805) had the address to achieve a jail-delivery also. For three or four days previous to that concerted for the escape, she pretended to be afflicted with a prodigious toothach; went out and in with her head enveloped in shawls and flannels; and groaned as if she had been about to give up the ghost. At length, when all the janitory officials were become so habituated to her appearance, as not very much to heed her exits and her entrances, Katherine Nairne one evening came down in her stead, with her head wrapped all round with the shawls, uttering the usual groans, and holding down her face upon her hands, as with agony, in the precise way customary with the midwife. The inner doorkeeper, not quite unconscious, it is supposed, of the trick, gave her a hearty thump upon the back as she passed out, calling her at the same time a howling old Jezebel, and wishing she would never come back to annoy his ears, and those of the other inmates, in such an intolerable way. There are two reports of the proceedings of Katherine Nairne after leaving the prison. One bears that she immediately left the town in a coach, to which she was handed by a friend stationed on purpose. The coachman, it is said, had orders from her relations, in the event of a pursuit, to drive into the sea, that she might drown herself—a fate which, however dreadful, was considered preferable to the ignominy of a public execution. The other story runs, that she went up the Lawnmarket to the Castlehill, where lived Mr ——, a respectable advocate, from whom, as he was her cousin, she expected to receive protection. Being ignorant of the town, she mistook the proper house, and, what was certainly remarkable, applied at that of the crown agent, who was assuredly the last man in the world that could have done her any service. As good luck would have it, she was not recognised by the servant, who civilly directed her to her cousin's house, where it is said she remained concealed many weeks. Her future life, it has been reported, was virtuous and fortunate. She was married to a French gentleman, was the mother of a large and respectable family, and died at a good old age. Meanwhile, Patrick Ogilvie, her associate in the dark crime which threw a shade over her younger years, suffered in the Grassmarket. This gentleman, who had been a lieutenant in the —— regiment, was so much beloved by his fellow-soldiers, who happened to be stationed at that time in Edinburgh Castle, that the public authorities judged it necessary to shut them up in that fortress till the execution was over, lest they might have attempted a rescue.

The Old Tolbooth was the scene of the suicide of Mungo Campbell, while under sentence of death (1770) for shooting the Earl of Eglintoune. In the district where this memorable event took place, it is somewhat remarkable that the fate of the murderer was more generally lamented than that of the murdered person. Campbell, though what was called "a graceless man," and therefore not much esteemed, was rather popular in his profession of exciseman, on account of his rough, honourable spirit, and his lenity in the matter of smuggling. Lord Eglintoune, on the contrary, was not liked, on account of the inconvenience which he occasioned to many of his tenants by newfangled improvements, and his introduction into the country of a generally abhorred article, denominated rye-grass, which was fully as unpopular a measure as the bringing in of Prelacy had been a century before. Lord Eglintoune was in the habit of taking strange crotchets about his farms—crotchets quite at variance with the old-established prejudices of his tenantry. He sometimes tried to rouse the old-fashioned farmers of Kyle from their negligence and supineness, by removing them to other farms, or causing two to exchange their possessions, in order, as he jocularly alleged, to prevent their furniture from getting mouldy, by long standing in particular damp corners. Though his lordship's projects were all undertaken in the spirit of improvement, and though these migrations were doubtless salutary in a place where the people were then involved in much sloth and nastiness, still they were premature, and carried on with rather a harsh spirit. They therefore excited feelings in the country people not at all favourable to his character. These, joined to the natural eagerness of the common people to exult over the fall of tyranny, and the puritanical spirit of the district, which disposed them to regard his lordship's peccadilloes as downwright libertinism, altogether conspired against him, and tended to throw the glory and the pity of the occasion upon his lordship's slayer. Even Mungo's poaching was excused, as a more amiable failing than the excessive solicitude about the preservation of game, which had always been the unpopular mania of the Eglintoune family. Mungo Campbell was a man respectably connected, the son of a provost of Ayr, had been a dragoon in his youth, was eccentric in his manners, a bachelor, and was considered at Newmills, where he resided, as an austere and unsocial, but honourable and correct man. There can be no doubt that he rose on his elbows and fired at his lordship, who had additionally provoked him by bursting into a laugh at his awkward fall. The Old Tolbooth was supposed by many, at the time, to have had her usual failing in Mungo's case. The interest of the Argyle family was said to have been employed in his favour; and the body, which was found suspended over the door, instead of being his, was thought to be that of a dead soldier from the castle substituted in his place. His relations, however, who were very respectable people in Ayrshire, all acknowledged that he died by his own hand; and this was the general idea of the mob of Edinburgh, who, getting the body into their hands, trailed it down the street to the King's Park, and, inspired by different sentiments from those of the Ayrshire people, were not satisfied till they got it up to the top of Salisbury Crags, from which they precipitated it down the *Cat Nick*.

So ends our gossip respecting a building which has witnessed and contained the meetings of the Scottish Parliament in the romantic days of the Jameses—which held the first fixed court of law established in the country—which was looked to by the citizens in a rude age as a fortified place for defence against external danger to their lives and goods—which has immured in its gloomy walls persons of all kinds liable to law, from the gallant Montrose, and the faithful Guthrie and Argyle, down to the humblest malefactor in the modern style of crime—and which, finally, under the name of the *Heart of Mid-Lothian*, has been embalmed in the imperishable pages of the greatest fictitious writer our country has ever produced.

THE HAPPY VALLEY.

To the enthusiastic lover of the vastness, the beauty, and variety of nature, few situations are capable of imparting the same delight which he feels when the winter he has passed amidst the sophisticated circles of fashionable society, and the narrow compass of the streets of a city, is over, and the earth, having once more donned her summer robe, invites him to go forth and contemplate its loveliness. It was in the blooming month of June that I turned my steps westward from the capital of Scotland, to visit several places celebrated for their beauty, which I had never seen. There is something in the view of new prospects, and in the treading on new ground, which has always had the most exhilarating effect on my mind; and I arrived at the end of my first day's journey in the best possible mood for enjoying the pleasure that awaited me. It was a clear, soft, balmy evening when I left the vehicle which had conveyed me from town, in order to prosecute on foot the remainder of the way to the place which was the present object of my travels, and where I intended to remain for some days, that I might have an opportunity of examining its works of complicated art, as well as its scenes of natural and picturesque beauty; there being in the place I was about to visit very extensive cotton-mills, whose site is at the bottom of a deep ravine, through which flows one of the principal rivers of Scotland. For the short distance of somewhat less than a mile, which I traversed before reaching the place of my destination, there were no very remarkable features in the country around to attract attention, or excite admiration, which was all in favour of the impression to be suddenly made, when the object of interest burst upon my view, and I beheld the vale through which the river winds, in all its luxuriance of beauty, lying at my feet, at a very considerable depth.

There I stood, in a perfect trance of delight, while I contemplated the circuitous paths which descend the banks in a perpetual zig-zag, and lead to the mills amidst trees of different kinds, whose foliage still retained the first bright and unsullied verdure of spring. The large masses of building, though constructed in straight and stiff lines, are prevented from appearing monotonous by their standing separately—by the manner of their disposition, the inequalities of the ground, and the scene of beauty in which they are embosomed, between the banks of the river, that are now precipitous, and now receding—in one place clothed with young plantations to the water's edge, and in another studded with trees the growth of ages, and interspersed alternately with rugged rocks and green slopes. The view was indeed like that of a fairy land, which I almost imagined myself to be entering after having left the every-day world behind me. I have seldom visited large manufacturing establishments without revolting from the moral picture they exhibited, in the squalid misery, or the impress of reckless vice in the people; but here every thing accords with the first delightful impression that you are entering a favoured spot, enclosed and kept apart from the wickedness that reigns in the earth; for you behold nearly two thousand of your fellow-beings rescued from idleness, want, and vice, by means of the benevolent and wise regulations to which they are subjected, and the unremitting care taken to put those regulations in force. Here all are well instructed, and supplied not only with the necessaries and decencies of life, while they are exempted, in as far as the nature of things admits, from its calamities, but also with many of its innocent recreations and enjoyments. Here health, order, neatness, and amity, prevail, while instances of depravity are exceedingly rare; and it enjoys the proud pre-eminence of being pronounced the place most free from crime of any in Scotland.

These peculiar features of this "happy valley," together with its contiguity to a domain of far-famed and almost unrivalled scenery, and the historical recollections of the adjacent country, which was in times long past the theatre of valiant and glorious deeds, naturally give an uncommon interest to every thing connected with it, and inspire or encourage in its visitors a certain imaginative temperament. It was thus that I felt myself daily impelled, during my stay within its romantic influence, to follow the river in its sinuous windings: to stand on the beetling precipices which overhang its leaping cataracts: to descend to its rocky caverns, and tread its tangled woods: and, above all, to question such persons as chance threw in my way, in the hope of finding some spot more certainly and more recently connected with the history of a human heart, than those spoken of in the vague legends of the olden time, and which might give to it the charm of association. For some days, I was disappointed in what, I am well aware, would be called by the generality of mankind a foolish fancy; but one evening, following a footpath into a thicket of birch and alder, I entered a small square space, round which a dilapidated hedge of mingled beech and thorn ran on three sides, and where from amidst the tall coarse grass peeped forth several low grave-stones scattered round a tomb, whose large flat surface gave it rather a more imposing appearance. On many of the smaller stones the letters were nearly obliterated, and on the rest they only signified the name and age of those they commemorated. The larger one was more communicative, for, beginning with that impressive entreaty, "Stop, traveller," after which we always expect to learn some tale of unusual interest, it went on to tell that its youthful tenant had been born in a distant part of England: that he had for a short period filled the place of schoolmaster at the manufactory: that he had gained the love and esteem of the people: and that, at the early age of eighteen, he had fallen from an overhanging cliff of the river into one of its deepest and darkest pools, out of which he was taken a lifeless corse.

Just as I had finished reading the inscription, I heard a rustling noise among the bushes, and the careless whistle of a country lad, who presently passed along one side of the enclosure; and being anxious to learn of him why this little spot had been set apart for the purpose of sepulture, I was informed that it was the burial-place of *strangers*. On my putting some questions to him relative to the young man on whose grave I was sitting, he pointed out to me one of the low head-stones near to it, as that of the unfortunate's mother, a widow woman, who, on hearing of the death of her only son, had travelled from England to learn the particulars of his sad fate, and to remain near his grave till she should herself occupy one by its side—which she soon took possession of, in this last abode of the stranger. How many affecting and melancholy ideas did this simple relation, and those magic words, *the stranger*, immediately conjure up! "Are we not all strangers in this poor pilgrim world?" said I. Why, then, are these mouldering remains separated from their kindred bones in the parish churchyard? Why are they outcasts from that common receptacle of mortality? Would the dust of the old inhabitants of the country be aggrieved by this intermixture? No, the sleep of the grave is too sound to be disturbed by the intrusion of strangers—it is the living dust alone that is thus punctilious. What is a stranger but a fellow-being launched like ourselves into this fleeting world—a brother of mortality, feeling like ourselves the same wants and wishes, joys and sorrows—one who has left a home that his heart yearns after with all its soothings of kindred affection, and its haunts of early days, and who vainly seeks in a strange land for something to fill the aching void created in his bosom! And the poor youth who lies beneath, and whose pulse no longer throbs with these recollections, toiled, perhaps, and studied on, in the fond hope of once more returning to cheer the heart of his widowed parent in his hallowed home, while she yet lived to bless him, little dreaming of the sad and sudden end that awaited him. His last sufferings were quickly over. But it was not thus with the mother. She too, had cherished the hope of his re-

turn; but he would come no more to cheer her solitary abode, to support her in her few remaining steps to the grave. The last solace of her life was gone, and, aged and destitute of worldly hope, she took her mournful journey, that she might hear his name repeated by those whose regard he had won—that she might contemplate the objects he had so lately looked upon—that she might spend the short time allotted to her near his early grave, and be undivided from him in death. Nor had she long, it appears, to wait, for the arrow had sped to her desolate heart. The wound was mortal beyond the healing balm of consolation, and she lies beside him in the burial-place of the stranger.

Thus it is with frail and helpless man, whose life is ever subject to the most calamitous changes—who cannot foresee a single event—who, when he begins his journey of life, knows not through what paths it is to lead him, or how, or where, or when, it is to terminate.*

SELF-APPRECIATION.

The self-appreciation of all men is perhaps pretty much alike: the grand difference lies in the power of concealing it. In one point of view, he whom the world calls the vain man is only the most candid, while the person denominated modest is only so far a hypocrite. Nevertheless, as the intrusion of our self-appreciation before the eyes of others is to them disagreeable, it must be considered as a violation of the convenience of our fellow-creatures, which, like all similar annoyances, they are entitled to resent; and as it at the same time betrays a want of self-command, or of knowledge of the world, on the part of those manifesting it, mankind are equally justified in characterising it as either a defect in character or in conduct. Whatever, therefore, be the comparative simplicity of intentions in the vain man, his fault is one which it is for his advantage to combat, and, if possible, suppress.

When any man conceives that he possesses some peculiar mental qualification which should bring him to distinction in life, let him exert that property in every feasible way for the end he has in view. All kinds of *doings* are tolerated in such a person: he may write upon the loftiest theme in the world, or attempt a scientific project, which, if successful, would revolutionise the general affairs of mankind. One thing, however, he *must not do:* he must never breathe a word to a living creature, that could be interpreted into a confession of his own sense of superiority. To put forward the slightest verbal or written pretension to a merit which either has or has not yet been conceded by the voice of his fellow-creatures, shipwrecks him at once, by stamping him as "a vain man." Nay, if he so much as receives a compliment in a way not perfectly modest—if he treats it in the least as a matter of course, or as a thing which he thought he had reason to expect—if he do not, in fact, express a perpetual wonder at the honours that come upon him, and appear, all the time he is writing and fighting for praise, to be unconscious of there being any such thing in the world, he is equally sure to get this condemning reputation. The world will allow him to be as great a dissembler as he pleases, but it will not allow him to show the most distant symptom of self-esteem—an expressive enough proof of the leniency with which mankind often treat real vices, while simple weaknesses are punished without mercy.

It is a common remark, that modesty is always found in the same proportion as true greatness. And so it well may. When the literary society of Portsmouth came to pay their respects to Sir Walter Scott, then about to depart for Italy, and to make him an honorary member of their body, he expressed himself as oppressed with a compliment, to which "so humble an individual as he" had no pretension! Such, we have learned from one of the society, were nearly his exact words; and innumerable anecdotes of this eminent man could be adduced to the same effect. Now, with us the wonder would have been greater, if a man who received praise so abundantly and so readily, had continued to appear externally covetous of it, or even in his heart received it with satisfaction. It was, in his case, water poured upon the drowned. The man from whom, in reality, modesty of this kind is least to be expected, is he, who, getting little spontaneous praise from his fellow-men, finds himself under the necessity of giving them a gentle hint now and then as to his pretensions, and thus ravishing what he cannot get by fair means. Such a man has no acquired reputation to risk by his want of modesty, and thus one of the greatest checks is wanting. The backwardness of mankind makes him desperate, and, seeing that he cannot be worse than he is, he hesitates not to tell them that he is at least no inconsiderable person in his own eyes. If such an individual, however, were suddenly to become really worthy of the admiration of his fellow-men, every step he advanced would be a pledge for his modesty, and he would at no time appear less aware of the existence of his laurels, than at the moment when they were actually blinding him with their luxuriance.

The strong and the feeble parts of human nature are so curiously mingled, that we sometimes find in one man the power to excel almost all others in a certain department of exertion, accompanied by an imbecility of character which causes him to seem even more vain and childish than the most unideaed fop. All who have been much acquainted, for instance, with literary men, must have remarked, that, in some, the power of composing language seemed rather to arise from a disease in their minds—a kind of suppuration—than from any superior organization or innate genius. Vanity is an almost unfailing peculiarity in such persons; and if they do any good at all, to no other impulse or motive can it be traced. While these considerations call for our wonder, they should also make us humanely lenient towards the class of offenders whom we are pointing out to public notice. I may grant that the manifestation of self-esteem is an annoyance to others; yet I am inclined at the same time to suspect, that he who is most anxious for praise himself, is likely to be most fretted by seeing it thus self-applied in another. On no other principle does it appear to me explicable, that men visit this foible with so much reprobation and ridicule, while they will strain every nerve, and scout every received moral maxim, in order to explain away the actual wickedness of some talented favourite, who perhaps despised them, and made them his tools. It is the part of a good spirit to regard this weakness with gentleness, as one which does no real harm to any one, while it is evidently a source of happiness to the individual in whom it is manifested. There are many points in human character more worthy of rebuke and more liable to reformation than this; and the pleasures of life are not so abundant as to enable us to spare even one so peculiarly founded on delusion.

THE PLAGUE OF THE WEST INDIES.

The people of this country frequently grumble at the variableness of the climate, and conceive themselves to be labouring under many discomforts. But they forget that they are entirely free of those dreadful plagues of warm countries—hosts of troublesome insects. The intolerable pest of America is the mosquito; yet it is surpassed by the insects of the West India islands, which are the source of never-ceasing annoyance. Mrs Carmichael, the intelligent authoress of a work on the West Indies, just published, relates the following remarkable instance of the prevalence of the insect plague:—

"One morning my attention was arrested at Laurel Hill by an unusual number of black birds, whose appearance was foreign to me; they were smaller, but not unlike an English crow, and were perched on a calibash tree near the kitchen. I asked D., who at that moment came up from the garden, what could be the cause of the appearance of so many of those black birds? She said, 'Misses, dem be a sign of the blessing of God; dey are not de blessing, but only de sign, as we say, of God's blessing. Misses, you'll see afore noontime how the ants will come and clear the houses.' At this moment I was called to breakfast, and thinking it was some superstitious idea of D.'s, I paid no further attention to it. In about two hours after this, I observed an uncommon number of chasseur-ants crawling about the floor of the room: my children were annoyed by them, and seated themselves on a table where their legs did not communicate with the floor. They did not crawl upon my person, but I was now surrounded by them. Shortly after this, the walls of the room became covered by them; and next they began to take possession of the tables and chairs. I now thought it necessary to take refuge in an adjoining room, separated only by a few ascending steps from the one we occupied; and this was not accomplished without great care and generalship; for had we trodden upon one, we should have been summarily punished. There were several ants on the step of the stair, but they were not nearly so numerous as in the room we had left; but the upper room presented a singular spectacle for not only were the floor and the walls covered like the other room, but the roof was covered also.

The open rafters of a West India house at all times afford shelter to a numerous tribe of insects, more particularly the cockroach; but now their destruction was inevitable. The chasseur-ants, as if trained for battle, ascended in regular thick files to the rafters, and threw down the cockroaches to their comrades on the floor, who as regularly marched off with the dead bodies of cockroaches, dragging them away by their united efforts with amazing rapidity. Either the cockroaches were stung to death on the rafters, or else the fall killed them. The ants never stopped to devour their prey, but conveyed it all to their store-house. The windward windows of this room were glass, and a battle now ensued between the ants and the jack-spaniards, on the panes of glass. The jack-spaniard may be called the wasp of the West Indies; it is twice as large as a British wasp, and its sting is in proportion more painful. It builds its nest in trees and old houses, and sometimes in the rafters of a room. The jack-spaniards were not quite such easy prey, for they used their wings, which not one cockroach had attempted. Two jack-spaniards, hotly pursued on the window, alighted on the dress of one of my children. I entreated her to sit still, and remain quiet. In an almost inconceivably short space of time, a party of ants crawled upon her frock, surrounded, covered the two jack-spaniards, and crawled down again to the floor, dragging off their prey, and doing the child no harm.

From this room I went to the adjoining bed-chamber and dressing-room, and found them equally in possession of the chasseurs. I opened a large military chest full of linens, which had been much infested for I was determined to take every advantage of such able hunters. I found the ants already inside: I suppose they must have got in at some opening at the hinges. I pulled out the linens on the floor, and with them hundreds of cockroaches, not one of which escaped.

We now left the house, and went to the chambers built at a little distance; but these also were in the same state. I next proceeded to open a store-room at the end of the other house, for a place of retreat; but, to get the key, I had to return to the under room, where the battle was now more hot than ever: the ants had commenced an attack upon the rats and mice; and, strange as it may appear, they were no match for their apparently insignificant foes. They surrounded them (as they had the insect tribe), covered them over, and dragged them off with a celerity and union of strength that no one who has not watched such a scene can comprehend. I did not see one mouse or rat escape, and I am sure I saw a score carried off during a very short period. We next tried the kitchen; for the store-room and boys' pantry were already occupied; but the kitchen was equally the field of battle between rats, mice, cockroaches, and ants killing them. A huckster negro came up selling cakes, and seeing the uproar, and the family and servants standing out in the sun, he said, 'Ah, misses, you've got the blessing of God to-day, and a great blessing it be to get such a cleaning.' I think it was about ten when I first observed the ants; about twelve, the battle was formidable; soon after one o'clock, the great strife began with the rats and mice; and about three, the houses were cleared. In a quarter of an hour more, the ants began to decamp, and soon not one was to be seen within doors. But the grass round the house was full of them; and they seemed now feasting on the remnants of their prey, which had been left on the road to their nests; and so the feasting continued till about four o'clock, when the black birds, who had never been long absent from the calibash and pois-doux trees in the neighbourhood, darted down among them, and destroyed by millions those who were too sluggish to make good their retreat. By five o'clock, the whole was over; before sun-down, the negro houses were also cleared out in the same way; and they told me they had seen the black birds hovering about the almond-trees, close to the negro houses, as early as seven in the morning. I never saw those black birds before or since, and the negroes assured me that they never were seen but at such times."

ESCAPE OF LIEUTENANT BOYS

FROM A FRENCH PRISON.

Lieutenant Boys, an officer in the British navy, has written an interesting account of his escape from the fortress of Valenciennes, where he was confined as a prisoner of war. In accomplishing his object, he had to encounter unheard of miseries, and at the outset found considerable difficulty in persuading some of his comrades to accompany him. Having at length settled the preliminaries of escape, he thus proceeds to detail his adventures:—

"Not an hour was lost in procuring every thing needful for the occasion; but before we could fix the precise day, we resolved to obtain some information respecting the obstacles in our passage to the upper citadel, that being the only way by which we could possibly escape. It was necessary to be very cautious in this particular, and many schemes were suggested.

At length, hearing that that part of the fortifications abounded in wild rabbits, my greyhounds were offered to one of the gendarmes, whenever he chose to make use of them; and the fellow mentioned it to the maréchal de logis, who was equally pleased with the expectation of sport, for they verily believed that such beautiful English dogs could kill every rabbit they saw. Shortly afterwards, the gendarme came, with the keys in his hand, for them, the maréchal de logis waiting at the gate. The dogs, however, had been taught to follow no one but their master, so that their refusing to go afforded me an opportunity of making an offer to accompany them, which was immediately accepted.

Whitehurst, Hunter, and two or three others, requested to go with us; four other gendarmes were ordered to attend, and we went in a tolerably large party. We took different directions round the ramparts, kicking the grass, under pretence of looking for rabbits; few were found, and none killed; but we succeeded in making our observations, and in

* This little burial-place for strangers is on the wooded bank immediately above New Lanark, and contains the tombstone and inscription mentioned above.

about an hour returned, fully satisfied of the practicability of escape, though the difficulties we had to encounter were, to scale a wall, to ascend the parapet unseen, to escape the observation of three or four sentinels and the patroles, to descend two ramparts of about forty-five feet each, to force two large locks, and to get over two draw-bridges. These were not more than we expected, and we therefore prepared accordingly.

On our return, we fixed the night of the 15th November for the attempt. In the meantime, my friend M'Intosh, then residing in town, got iron-handles put to a pair of steel boot-hooks, given to me by Craig, which I intended to use as picklocks. The only thing now wanting was another rope; and as that belonging to the well in the midshipmen's yard was (from decay) not trust-worthy, in the night we hacked several of the heart-yarns, so that the first time it was used in the morning it broke. A subscription was made by the mids, and a new one applied for. By these means we had at command about thirty-six feet, in addition to what our friends had before purchased of the boys. Every thing was now prepared; the spirits and provisions in the knapsacks were concealed in the dog-kennel.

On the 14th, Whitehurst communicated the secret to a young mid, named Mansell, who immediately proposed to join, and my consent was requested; but I strongly objected, under the impression of his being unable to endure the privations and hardships to which we might probably be exposed: by the persuasion of Ricketts and Cadell, however, I at last consented.

At length the time arrived which I had so ardently desired, and the feelings of delight with which I hailed it were such as allowed me to anticipate the happiest results. The thought of having lost so many years from the service of my country, during an active war, had frequently embittered hours which would otherwise have been cheerful and merry, and now proved a stimulant to perseverance, exceeded only by that which arose from the desire I felt to impress upon the minds of Frenchmen the inefficacy of vigilance and severity to enchain a British officer, when compared with that milder and more certain mode of securing his person, 'confiding in his honour.'

As the sun declined, our excitement increased. Our plans had been conducted with such profound secrecy, that only our most confidential friends entertained the slightest suspicion of our intention. At the usual hour we retired to rest; at half-past eleven we arose, and, in preparation for our departure, went into the midshipmen's little yard, unspliced the well-rope, and returned to the apartment. Desirous of bidding adieu to our messmates, the six who slept in the room were awakened. On seeing the manner in which we were equipped, the rope slung over the shoulder, the knapsacks, the implements, and the laugh each one was endeavouring to stifle, they were so confused, that they could not, for the moment, comprehend why we were thus attired. When told that we intended being in England in ten days, they exclaimed, 'Impossible!' and argued against the attempt, as nothing better than the effect of insanity, insisting that we were obstinately running, with our eyes open, into the very mouth of destruction. But as such remarks, if listened to, might only have tended to create indecision, we shook hands, and said, 'Good night.' When about to depart, Cadell observed, we had better wait a few minutes, as it was then very star-light, and nearly a calm. His advice was attended to, and we impatiently waited the passing of a cloud, in the hope of its increasing the obscurity; but the clouds dispersed, the wind died away, and nothing disturbed the silence of the night but the watch-calls of the sentinels, and the occasional footsteps of the patroles. This anxious state of suspense continued until two o'clock, when we again rose to depart, but were prevented by the kind interference of our friends, who insisted on our waiting a little longer, arguing, that as I had met with so many disappointments, and had so repeatedly avowed my intention to act prudently, we ought to wait, even till the morrow-night, if necessary. 'What folly,' continued Ricketts, 'to blast all your prospects by false notions of honour;' but the idea of flinching at this crisis was so repugnant to my feelings, and so wounding to my pride, that it was with the utmost reluctance I could consent to postpone the attempt another minute. On reflection, however, I felt the propriety of his remarks, and also that our liberty and lives being, in a great measure, dependent upon my discretion, it behoved me not to allow my judgment to be influenced by the opinions of the illiberal or hot-headed, who I feared would attribute our delay to other causes than the real one. However, that mattered little: patient and persevering, we anxiously watched the stars, and, sensibly alive to every thing that could for a moment endanger the confidence reposed in me by my companions, I listened with attention to their opinions, when, finding them to coincide with my own, and the clock now striking three, we agreed to postpone the attempt till the following night, and then start about eight P.M. All present promised secrecy: we replaced the well-rope, returned our knapsacks to the care of the greyhounds, and retired to bed.

The next morning nothing material occurred: the movements of the preceding night were unsuspected. In the afternoon we amused ourselves with writing a letter to the commandant, in which we thanked him for his civilities, and assured him that it was the rigid and disgraceful measures of the French government which obliged us to prove the inefficacy of 'locks, bolts, and fortresses,' and that if he wished to detain British officers, the most effectual method was to put them upon their 'honour;' for that alone was the bond which had enchained us for more than five years. This letter was left with Ricketts to be dropped on the following day near the '*corps de garde*.' At half-past seven P.M., we assembled, each provided with a clasp-knife and a paper of fine pepper, upon which we placed our chief dependence, for, in case of being closely attacked, we intended to throw a handful into the eyes of the assailants, and then to retreat.

The plan was, that Hunter and myself were to depart first, fix the rope, and open the opposing doors; a quarter of an hour afterwards, Whitehurst and Mansell were to follow. By these means we diminished the risk attendant on so large a body as four moving together, and secured the advantage of each depending more upon his own care; for if Hunter and myself were shot in the advance, the other two would remain in safety; and if, on the contrary, they were discovered, we hoped to have time during the alarm to gain the country. Our intentions were to march to the sea-side, and range the coast to Breskins, in the island of Cadsand, opposite Flushing, and if means of getting afloat were not found before arriving at that place, we proposed to embark in the passage-boat for Flushing, and, about mid-channel, rise and seize the vessel.

It was now blowing very fresh, and was so dark and cloudy that not a star could be seen; the leaves were falling in abundance, and, as they were blown over the stones, kept up a constant rustling noise, which was particularly favourable to the enterprise; indeed, things wore so promising an appearance, that we resolved to take leave of a few other of our brother officers. Accordingly, Messrs Hulford, Rochfort, Wright, Miller, Mahony, Robinson, and two others, were invited; to these I detailed our exact situation, the difficulties we had to contend with, and the means of surmounting them; reminded them of our letter to the commandant of last month, and the glory of putting our threats into execution in spite of his increased vigilance; read the one we had that afternoon written, and proposed that any of them should follow that chose, but with this stipulation, that they allowed four hours to elapse before they made the attempt. Upon which, it being a quarter past eight, Hunter and I, with woollen socks over our shoes, that our footsteps might not be heard, and each having a rope, a small poker, or a stake, and knapsack, took leave of our friends, and departed.

We first went into the back yard, and, assisted by Rochfort, who was now convalescent, but not sufficiently strong to join the party, got over the wall, passed through the garden and palisades, crossed the road, and climbed silently upon our hands and knees up the bank, at the back of the north guard-room, lying perfectly still as the sentinels approached, and, as they receded, again advancing, until we reached the parapet over the gateway, leading to the upper citadel. Here the breastwork over which we had to creep was about five feet high and fourteen thick, and it being the highest part of the citadel, we were in danger of being seen by several sentinels below; but, fortunately, the cold bleak wind induced some of them to take shelter in their boxes. With the utmost precaution we crept upon the summit, and down the breastwork, towards the outer edge of the rampart, when the sentinel made his quarter-hourly cry of 'Sentinelle prenez garde à vous,' similar to our 'All's well;' this, though it created for a moment rather an unpleasant sensation, convinced me that we had reached thus far unobserved.

I then forced the poker into the earth, and, by rising and falling with nearly my whole weight, hammered it down with my chest. About two feet behind, I did the same with the stake, then slipt the eye of the well-rope over the head of the poker, and fastened a small line from the upper part of the poker to the lower part of the stake. This done, we gently let the rope down through one of the grooves in the rampart, which receives a beam of the drawbridge when up. I then cautiously descended this half chimney, as it were, by the rope. When I had reached about two-thirds of the way down, part of a brick fell, struck against the side, and rebounded against my chest; this I luckily caught between my knees, and carried down without noise.

I crossed the bridge, and waited for Hunter, who descended with equal care and silence. We then entered the revelin, proceeded through the arched passage which forms an obtuse angle with a massive door leading to the upper citadel, and with my picklock endeavoured to open it; but not finding the bolt yield with gentle pressure, I added the other hand, and gradually increased the force, until, by exerting my whole strength, something broke. I then tried to file the catch off the bolt, but that being cast iron, the file made no impression; we then endeavoured to cut away the stone in the wall which receives the bolt, but that was fortified with a bar of iron, so that it was impracticable. The picklocks were again applied, but with no better success. It now appeared complete check-mate, and, as the last resource, it was proposed to return to the bridge, slip down the piles, and float along the canal on our backs, there being too little water to swim and too much mud to ford it. Hunter, with the most deliberate coolness, suggested the getting up the rope again, and attempting some other part of the fortress. In the midst of our consultation, it occurred to me that it would be possible to undermine the gate: this plan was no sooner proposed than commenced, but having no other implements than our pocket-knives, some time elapsed before we could indulge any reasonable hopes of success: the pavement stones under the door were about ten inches square, and so closely bound together, that it was a most difficult and tedious process. About a quarter of an hour had been thus employed, when we were alarmed by a sudden noise, similar to the distant report of a gun, echoing in tremulous reverberations through the arched passage; and as the sound became fainter, it resembled the cautious opening of the great gate, creating a belief that we were discovered. We jumped up, drew back towards the bridge, intending, if possible, to steal past the gendarmes, and slip down the piles into the canal; but the noise subsiding, we stood still, fancying we heard the footsteps of a body of men.

The recollection of the barbarous murderers at Biche, on a similar occasion, instantly presented itself to my sensitive imagination; it is impossible to describe the conflicting sensations which rushed upon my mind during this awful pause. Fully impressed with the conviction of discovery, and of falling immediate victims to the merciless rage of ferocious blood-hounds, in breathless anxiety I stood and listened, with my knife in savage grasp, waiting the dreadful issue, when, suddenly, I felt a glow flush through my veins, which hurried me on with the desperate determination to succeed, or make a sacrifice of life in the attempt. We had scarcely reached the turning when footsteps were again heard, and, in a whispering tone, 'Boys.' This welcome sound created so sudden a transition from desperation to serenity, from despair to so pleasing a conviction of success, that in an instant all was hope and joy. Reinforced by our two friends, we again returned to our work of mining, with as much cheerfulness and confidence as though already embarked for England. They told us the noise was occasioned by the fall of a knapsack, which Mansell, unable to carry down the rope, had given to Whitehurst, from whom it slipped, and falling upon a hollow sounding bridge, between two lofty ramparts, echoed through the arched passage with sufficient effect to excite alarm. Whitehurst, with much presence of mind, stood perfectly still when he landed on the bridge, and heard the sentinel walk up to the door on the inside, and stand still also; at this time they were not more than four feet from each other; and had the sentinel stood listening a minute longer, he must have heard Mansell land.

Three of us continued mining until half-past ten, when the first stone was raised, and in twenty minutes the second. About eleven, the hole was large enough to allow us to creep under the door. The drawbridge was up; there was, however, sufficient space between it and the door to allow us to climb up; and the drawbridge being square, there was, of course, an opening under the arch. Through this opening we crept, lowered ourselves down by the second rope, which was passed round the chain of the bridge, and keeping both parts in our hands, landed on the 'guarde fous.'* Had these bars been taken away, escape would have been impossible, there not being sufficient rope for descending into the ditch. By keeping both parts of it in our hands, the last man was enabled to bring it away, otherwise four ropes would have been necessary.

We then proceeded through another arched passage, with the intention of undermining the second door; but, to our great surprise and joy, we found the gendarmes had neglected to lock it. The drawbridge was up. This, however, detained us but a short time; we got over, crossed the ditch upon the 'guarde fous,' as before, and landed in the upper citadel. We proceeded to the north-east curtain, fixed the stake, and fastened the rope upon the breastwork for the fourth descent. As I was getting down, with my chest against the edge of the parapet, the stake gave way. Whitehurst, who was sitting by it, snatched hold of the rope, and Mansell, of his coat, whilst I endeavoured to grasp the grass, by which I was saved from a fall of about *fifty feet*. Fortunately, there was a solitary tree in the citadel; from this a second stake was cut, and the rope doubly secured as before. We all got down safe with our knapsacks, except Whitehurst, who, when about two-thirds of the way, from placing his feet against the rampart, and not letting them slip so fast as his hands, got himself in nearly a horizontal position; seeing his danger, I seized the rope, and placed myself in rather an inclined posture under him; he fell upon my arm and shoulder with a violent shock. Fortunately neither of us were hurt; but it is somewhat remarkable, that within the lapse of a few minutes we preserved each other from probable destruction.

The vivid imagination of the indulgent reader will better depict than I can describe our feelings at this momentous period; suffice it to say, that we heartily congratulated ourselves upon our providential success, after a perilous and laborious work of three hours and

* The 'guarde fous' are two iron bars, one above the other, suspended by chains on each side of the ridge—when down, serving the purpose of hand-rails.

three quarters; and, in the excess of joy, all shook hands.

Having put our knapsacks a little in order, we mounted the glacis, and followed a footpath which led to the eastward. But a few minutes elapsed, when several objects were observed on the ground, which imagination, ever on the alert, metamorphosed into gendarmes in ambush; we, however, marched on, when, to our no small relief, they were discovered to be cattle. Gaining the high road, we passed (two and two, about forty paces apart) through a very long village, and having travelled three or four miles, felt ourselves so excessively thirsty that we stopped to drink at a ditch; in the act of stooping, a sudden flash of lightning, from southward, so frightened us (supposing it to be the alarm-gun), that, instead of waiting to drink, we ran for nearly half an hour. We stopped a second time, and were prevented by a second flash, which alarmed us even more than the first, for we could not persuade ourselves it was lightning, though no report was heard. Following up the road in quick march, our attention was suddenly arrested by a draw-bridge, which being indicative of a fortified place, we suspected a guard-house to be close at hand, and were at first apprehensive of meeting with a serious impediment; but observing the gates to be open, we concluded that those at the other extremity would be also open, and therefore pushed forward. We drank at the pump in the square, when it was recollected that this was the little town of St Amand. Directing our course by the north star, which was occasionally visible, we passed through without seeing a creature.

About an hour afterwards, still continuing a steady pace, four stout fellows rushed out from behind a hedge, and demanded where we were going. Whitehurst and Mansell immediately ran up; and as we previously resolved never to be taken by equal numbers, each seized his pepper and his knife in preparation for fight or flight, replying, in a haughty tone of defiance, 'What is that to you?—be careful how you interrupt military men:' then whispered loud enough for them to hear 'la bayonette,' upon which they dropped astern, though they still kept near us.* In the course of a quarter of an hour, on turning an angle of the road, we lost sight of them, and continued a rapid march, frequently running, until about five A. M., when we were unexpectedly stopped by the closed gates of a town. We retraced our steps a short distance, in the hope of discovering some other road, but we could find neither a footpath, nor wood, nor any other place of concealment. We quitted the high road, and drew towards a rising ground, there to wait the dawn of day, in the hope of retreating to some neighbouring copse. No sooner had we laid ourselves upon the ground, than sleep overcame us.

Our intention was, if no wood could be seen, to go to an adjoining ploughed field, and there scratch a hole in which we could hide ourselves from a distant view; upon awakening from a short slumber, we reconnoitred around, and found our position to be near a fortification; being well acquainted with such places, we approached, in the hope of finding an asylum. At break of day, we descended into the ditch, and found the entrance into the subterraneous works of the covered way nearly all blocked up with ruins and bushes; an opening, however, was made; we crept in, our quarters were established, and the rubbish and bushes replaced in the space of a few minutes."

Unfavourable as the condition now was of these intrepid Englishmen, they contrived to procure friends willing to aid in their liberation. By good luck, they became acquainted with a smuggler, who offered to convey them to England, although at a great risk to all parties. The author thus concludes his interesting narrative:—

"At length, on the 8th of May, positive information was brought that all would be in readiness at ten o'clock at night; accordingly, at that hour, the weather fine, and the night dark, we marched down from our place of concealment to the beach, and as soon as the patrole had passed, the private signal was made and answered. The boat gliding silently in shore with muffled oars, we rushed in with the rapidity of thought, and, in an instant, were all safe afloat; each seized an oar, and, vigorously applying his utmost strength, we soon reached beyond the range of shot.

It were in vain to attempt a faithful description of our feelings at this momentous crisis; the lapse of a few minutes had wrought such a change of extremes, that I doubt, if amidst a confusion of senses, we could immediately divest ourselves of the apprehensions which constant habit had engrafted on the mind; nor, indeed, could we relinquish the oar, but continued at this laborious, though now delightful occupation, almost without intermission the whole night.

When the day dawned, the breeze freshened from the eastward, and as the sun began to diffuse his cheering rays, the wide expanse of liberty opened around us, and in the distant rear the afflicted land of misery and bondage was beheld with feelings of gratitude and triumph. No other object intercepted the boundless prospect save a solitary gun-brig, which was soon approached. Naturally anxious to proceed with dispatch, we passed on, and, unobserved, reached a considerable distance, when a boat was discovered making towards us. Being in no fear of Frenchmen thus venturing so far from land, we hove to; and, having made the officer acquainted with the circumstances of our embarkation and destination, again spread the canvass, and made rapid progress to the N.W. About noon, the wind still increasing, and the sea rising, it was deemed prudent to close-reef the sail. While thus delightfully scudding before the foaming billows, which occasionally broke as if to overwhelm our little boat, only fifteen feet in length, each eye was steadily fixed a-head, anxious to be the first to announce land. It was not, however, till towards three P.M. that the white cliffs were seen. Although our situation was already replete with 'joy and gladness,' still the first sight of our native shore, after so long an absence, coupled with the recollection of conquered difficulties, excited increased happiness, and afforded ample compensation for past sufferings, though not without a pleasing hope that promotion would be their reward.

On falling in with a fishing smack, at the back of the Goodwin Sands, the master welcomed us on board, and taking the boat in tow, ran for Ramsgate. On entering the harbour at five o'clock, I landed with such ineffable emotions of joy, that, with a heart throbbing almost to suffocation, regardless of the numerous spectators, I fell down and kissed with rapture the blessed land of liberty."

* These men were robbers.

BIOGRAPHIC SKETCHES.

HUMBOLDT.

HUMBOLDT, one of the most successful of modern travellers, and who still survives, fulfils in the mind of intelligent men the perfect idea of a person every way suited to the pursuit of knowledge in remote regions of the globe. He is at once an astronomer, a physiologist, a botanist, a metaphysician, an antiquary, a philologist; he is learned in statistics and political economy; and this assemblage of acquirements, so rarely found united in a single individual, are in him accompanied with sleepless activity of mind, and with all the zeal, enterprise, and vigour, necessary to give them their full effect.

Frederick Henry Alexander Von Humboldt was born at Berlin, September 14, 1769. After studying at Gottingen and Frankfort on the Oder, in 1790 he visited Holland and England; and the fruit of this his first effort in a vocation in which he was to become so renowned, was a work entitled "Observations on the Basalts* of the Rhine." In 1791, he studied mining and botany at the mining school in Freyberg, where his talents, acquirements, and amiable deportment, bought him golden opinions of all men. In the year following, he was appointed assessor in the mining and smelting department, and soon afterwards removed to Baireuth, as overseer of the mines in Franconia. Here he introduced a variety of improvements—in particular the establishment of a mining school at Steben; he also made several valuable galvanic experiments, the results of which he published in 1796. In the year previous to this, he voluntarily abandoned his office, from an insatiable desire to travel. He went to Italy, and in the autumn of the same year traversed a part of Switzerland. In 1797, he visited Paris, where he formed a connection with Aimé Bonpland, a pupil of the medical school and botanic garden in the French capital. From Paris, Humboldt set out for Madrid, with a considerable collection of instruments; for he had for some years cherished the design of travelling within the tropics at his own expense. In 1799, the court granted him permission to travel through the Spanish colonies in America; and he thereupon sent for his young friend Bonpland, who joined him immediately, and set sail with him from Corunna.

The plan of travel which these two friends sketched for themselves, was laid out upon a more extensive scale than that of any journey hitherto undertaken by private persons. Five years was the period in which they proposed to explore distant regions, and in that space of time no two individuals ever collected so much useful information, and returned to Europe so richly fraught with oblations, amassed with unwearied zeal, and which were destined for the altar of science. Our travellers landed at Teneriffe towards the end of June 1799. After making various philosophical excursions into the country, they ascended the Peak, which, according to Humboldt, rises 12,176 English feet above the level of the sea. This remarkable mountain has been ably described by our traveller; and our knowledge of its geology, botany, &c., now scarcely admits of improvement; indeed, this may be said of almost every region explored by the gifted Prussian. In July they arrived at Cumana, the capital of New Andalusia, in South America. During this and the following year, they visited the coasts of Paria, the Indian missions, and the province in which they landed; travelling likewise through New Barcelona, Venezuela, and Spanish Guiana. It would be an endless task to attempt the enumeration of all the new philosophical and other observations made by Humboldt and his companion in these excursions: it is sufficient to say, that nothing which can add to our information upon the nature of the country, its history and inhabitants, is overlooked. They fixed the longitude of Cumana, Caraccas, and many other important places; added vastly to our knowledge of the general phenomena of earthquakes and volcanos; and, in fine, presented Europe with a faithful and full-length picture of the several countries which they visited—such a one as the philosopher will frequently examine for facts to establish his inductions, the geographer to collect materials for his compilations, and the moral philosopher and philologist to be enlightened upon the nature of man and his language. From Caraccus they went to the charming vallies of Aragua, where the eye luxuriates over the splendour of tropical vegetation. They afterwards travelled into the interior as far as the equator; traversed the vast plains of Calabozo, Apura, and the Llanos, where the thermometer stood in the shade at 106–115° of Fahrenheit, and the hot surface of the earth showed, for 42,000 square miles, but a very slight difference of level. They also observed upon the sand here, the phenomena of refraction and singular elevations At San Fernando of Apura, they commenced a voyage of above 500 leagues in canoes, surveying the country, and ascertaining the height of the various elevations, by means of philosophical instruments and some of the heavenly bodies. They descended the Rio Apura, which disembogues its waters into the Orinoco in the seventh degree of north latitude, ascended the latter to the mouth of the Rio Guaviare, and passed the remarkable waterfalls of Ataris and Maipure, where the cave of Atarnipo encloses the mummies of a nation which was destroyed in a war with the Caribs and Maravites. After navigating various rivers, visiting the mission of Javita, and the sources of the Griginia (Rio Negro), they descended this river to the fort of San Carlos, and the boundaries of Grand Para, the principal capitancy of Brazil. Our travellers now undertook a long and hazardous journey for the purpose of determining the branch of the great Orinoco, called Cassiquiari, which unites that river with the famous Amazon; but the difficulties encountered from the savage Indian tribes rendered it an impossibility to reach the sources of the Orinoco. From Esmeralda, a solitary and remote Christian settlement on the upper Orinoco, they travelled the whole length of that river to its mouth at St Thomas, or Augustura, in New Guiana, a distance of nearly 1000 miles. Humboldt relates a curious circumstance which occurred during his stay here: An Indian having gone to anchor his canoe in a cove where there were not three feet of water, a fierce crocodile, which would seem to have been here the lord of the manor, seized him by the leg, and carried him off. With remarkable courage and presence of mind, after having searched in vain in his pocket for a knife, he thrust his fingers into the animal's eyes. The monster, however, succeeded in effecting the destruction of his victim, after plunging to the bottom of the river, and drowning the Indian, and rose to the surface and dragged the body to a neighbouring island. He also relates a remarkable fact, that one of the many savage tribes whose country he had to traverse, are in the habit of swallowing quantities of earth, in which, to all appearance, there is not a particle of nourishment, for the purpose of allaying hunger.

After encountering severe hardships in their journies to various places, our travellers took their departure for Cuba, one of the West India islands belonging to Spain. Here they were employed three months, partly in determining the longitude of Havannah, the capital of that island, and partly in erecting a new furnace for boiling sugar. It was now their intention to have gone to Vera Cruz, from that place to the Philippine Islands, and from thence, if practicable, through Bombay, Bassora, and Aleppo, to Constantinople. Humboldt had made arrangements previous to quitting Paris, that if the French expedition should take effect during his absence, he would unite himself to it. Circumstances occurred, however, which prevented him from accomplishing his purpose. In March 1801, he sailed along the southern part of the island of Cuba, making astronomical observations of different points in the group of islands called the Jardin del Rey, together with the landing-places in the harbour of Trinidad. At Rio Sinu, a place hitherto untrod by the foot of a botanist, he made a short stay collecting specimens. A desire to find some celebrated plants induced the travellers to spend several weeks in the forests of Turbaco, which were adorned with the most splendid flowers. They afterwards descended the river Magdelana, of which Humboldt sketched a chart, whilst his companion employed his time in studying the vegetable tribes which peopled its banks. From Honda, they travelled to Santa Fe-de-Bogota, the capital of New Granada. The valuable collections of Mutis, a celebrated botanist, the waterfall of Tequendama, the mining works of Mariquita, Santa Anna, and De Zipagnira, the natural bridge of Icononzo—two rocks rent asunder by one of those terrible con-

* Basalt is one of the species of trap rocks which are frequently exhibited in the form of columns, as in Fingal's Cave, Isle of Staffa. For further information, see Account of the Globe, Information for the People, No. 6.

vulsions of nature so frequent in these regions, and supporting a third, which seems to tremble in the air to every breeze—these remarkable objects engaged the attention of our travellers till September 1801. The weather here now becomes very unfavourable for travelling; but nothing could damp their enthusiasm, or deter them from prosecuting their labours. They set out for Quito, a province and city of the republic of Colombia. The city lies upon the volcanic mountain Pinchincha, at an elevation of 6550 feet above the level of the sea. They then descended the valley of the river Magdelana, crossed the Andes at Quindiu, where a forest of storax and beautiful passion-flowers blow unchilled on the bosom of the eternal snows of Tolina. Barefooted and wet, more resembling ardent religious devotees performing a severe act of penance, than individuals travelling for their own pleasure, and the benefit of science and mankind, they reached the valley of the river Cauca. After having traversed the province of Choco, the region of the metal platina, they ascended to Popayan, at the foot of the snow-capped volcanos of Purace and Stora, passing through Calito, and the gold-washings of Quilichao. In this remarkable climate the thermometer stood always at 70–74° of Fahrenheit. After laborious exertions, they succeeded in reaching to the crater of the volcano Purace, the mouth of which is filled with boiling water, and, in the midst of perpetual snow, continually exhales a vapour of what is called, in chemical language, sulphuretted hydrogen, a gas somewhat similar to that with which our streets and houses are lighted.

After crossing the steep Cordilleras of Almaguer, and traversing many inhospitable and mountainous regions, they arrived at the city of Quito, on January 6, 1802. The kingdom of Quito is remarkable for its gigantic mountains, its volcanos, its vegetation, its ancient mountains, but, above all, for the manners and customs of its former inhabitants. The philosophical survey of our travellers occupied them for nine months. They twice ascended to the crater of the volcano Pinchincha, where they performed experiments to ascertain the composition of the air, its electrical, magnetical, and hygroscopical peculiarities, its elasticity, and the degree of temperature of boiling water. They made repeated excursions to the mountains of Aritosana, Cotopaxi, Tunguragua, and Chimborazo, whose summits are crowned with a diadem of perpetual snow. Humboldt made some important discoveries with regard to the Andes. He has fully established the important fact, that some of the volcanos with which they abound have considerably sunk since 1753, with which result the reports of the inhabitants also entirely coincide. He was also convinced that all these stupendous masses were formed by crystallisation. Our travellers scaled the summits of the most remarkable mountains, reaching an elevation hitherto unattained by human foot. They ascended Chimborazo, June 23, 1802, 18,576 French feet above the level of the sea. The blood exuded from their eyes, lips, and gums, and they became almost torpid through the excessive cold. A narrow deep valley prevented them from reaching the most remote summit of the mountain, which is about 1344 feet higher. Cotopaxi is the loftiest of those volcanos of the Andes which have produced eruptions at recent periods; its absolute height is 18,878 feet, and is, consequently, 2625 feet higher than Vesuvius would be were it piled upon the top of the Peak of Teneriffe. The form of this celebrated mountain is the most regular and beautiful of all the colossal summits of that mighty chain of which it constitutes a link. It is a perfect cone, and covered with snows, "and sunset into rose-hues sees them wrought." At that time the mountain may be seen from an immense distance shining with dazzling effulgence.

Our travellers having quitted Quito, pointed their course towards the great river Amazon, visiting on their way the ruins of Lactacunga, Hambato, and Riobamba, situated in a country the natural landmarks of which had in 1797 been nearly obliterated by earthquakes, which destroyed, besides, 40,000 individuals. They then passed to Loxa, where in the forests of Gonzanama and Malaeates they examined the trees which yield the Peruvian bark. Leaving Loxa, they entered Peru by Ayavaca and Gouncabamba, traversing the ridge of the Andes, to descend to the river Amazon. They were compelled to cross the Rio de Chayma no less than thirty-five times in two days. They saw the splendid ruins of the Causeway of the Incas (monarchs of Peru), which passes over the porphyry rocks of the Andes at a height of from 7670 to 11,510 feet. They then took a raft, and embarked upon the river Chamya for the Amazon, and ascertained the astronomical situation of their junction. Humboldt followed the Amazon to the cataract Rentewa, and at Tomependa drew up an accurate plan of this unknown part of the river. His companion, in the meanwhile, had been busily employed upon the vegetable kingdom. In returning to Peru, our travellers, for the fifth time, crossed the Andes. In seven degrees of south latitude, they determined the position of the magnetic equator, or the line in which the needle has no inclination. They likewise examined the rich mines of Hualguayok, where native silver is obtained at an elevation of 12,790 feet above the surface of the sea. From Caxamarca, which is celebrated for its baths and ruins, they descended to Truxillo, in the neighbourhood of which are included the ruins of the immense Peruvian city Mansiche, decorated with pyramids, in one of which, in the eighteenth century, was found a quantity of beaten gold to the value of 4,000,000 livres. Descending the western side of the Andes, they for the first time obtained a magnificent view of the great Pacific Ocean, and of the long and narrow valley bounded by its shores, where rain and thunder are unknown. They followed the arid coast of the Southern Ocean through Santa and Guarmey to Lima, where Humboldt was fortunate enough to observe with considerable accuracy, in the harbour of Callao de Lima, the termination of the planet Mercury's transit over the sun, a celestial phenomenon which some time before he had undertaken a long journey to obtain a glimpse of.—We shall continue the narrative in another article.

FIELD FLOWERS.

[By Thomas Campbell.]

Ye field flowers! the gardens eclipse you, 'tis true,
Yet, wildings of Nature, I doat upon you,
For ye waft me to summers of old,
When the earth teem'd around me with faery delight,
And when daisies and buttercups gladden'd my sight,
Like treasures of silver and gold.

I love you for lulling me back into dreams
Of the blue Highland mountains and echoing streams
And of broken glades breathing their balm,
While the deer was seen glancing in sunshine remote,
And the deep mellow crush of the wood-pigeon's note
Made music that sweeten'd the calm.

Not a pastoral song has a pleasanter tune
Than ye speak to my heart, little wildings of June:
Of old ruinous castles ye tell,
Where I thought it delightful your beauties to find,
When the magic of Nature first breathed on my mind,
And your blossoms were part of her spell.

Ev'n now what affections the violet awakes;
What loved little islands, twice seen in their lakes,
Can the wild water-lily restore:
What landscapes I read in the primrose's looks,
And what pictures of pebbled and minnowy brooks
In the vetches that tangled their shore.

Earth's cultureless buds, to my heart ye were dear,
Ere the fever of passion, or ague of fear,
Had scathed my existence's bloom;
Once I welcome you more, in life's passionless stage,
With the visions of youth to revisit my age,
And I wish you to grow on my tomb.

SHAPE OF THE EARTH, ITS SIZE, AND DENSITY.

[From the American Almanack for 1831.]

The level portions of the earth's surface seem at first view perfectly flat. But if we examine them more critically, and for a considerable extent, we shall find that they are decidedly convex, or swelled out in the middle. The light of a lighthouse requires to be raised, in order to be seen at any considerable distance. Let it be placed on a level with the sea, and a person of the common height, or whose eyes are less than six feet above the surface of the sea, would not be able to see it at the distance of four miles, however strong and clear the light might be. But upon raising himself higher and higher, he would at length, when his eye had reached an elevation of ten or eleven feet above the surface, be able to discern it just grazing the surface of the water. The same effect would be produced if the light were raised ten or eleven feet, and the eye of the observer were on the level of the ocean. And a light 60 or 100 feet high disappears in like manner by sinking lower and lower; only the distance at which we are required to place ourselves to produce this effect, becomes greater and greater according to the elevation of the light, and according also to our own elevation above the level of the sea. The most convenient position for a nice observation of this kind is an extended lake, when covered with smooth ice. We will suppose ourselves provided with a common leveling instrument, or any long tube capable of being fixed in an exactly horizontal position, which is easily determined by a water-level, or by being at right angles to a plumb-line. Let us suppose that the line of sight through the tube is precisely four feet from the ice, and that the tube can be turned in all directions without varying from a horizontal or level position. If we now look through the tube at an upright rod or pole placed with one end on the ice at different distances, we shall be able to establish, in the most satisfactory manner, the following important facts:—

1. The line of sight, or *apparent level*, as it is called, departs from the surface of the ice, or *true level*, in whatever direction we look.

2. This departure, or *difference of level*, is the same in all directions as to the points of the compass, where the distance from the observer is the same.

3. The difference of level for a distance of one mile is 8 inches.

4. If we double any distance, the difference of level is quadrupled; and if we triple the distance, the difference of level is nine times as great, and so on, according to the law of the squares; that is, the difference of level for one mile being 8 inches, that for two miles is not twice 8, but four times 8, or 32 inches, and that for three miles is 9 times 8, or 72 inches.

Similar observations being made in other places in different parts of the earth, we arrive at essentially the same results.

The facts above given lead to conclusions not less curious and striking.

1. The earth's surface is curved, instead of being plane, or flat, and plumb-lines, or lines perpendicular to the surface, are not strictly parallel, but incline more and more the farther they are apart, and tend to meet at some point within.

2. The earth appears to be equally curved in all directions, and the law of the departure of the apparent from the true level, indicates a spherical surface.

But while we have thus found out the general dimensions of the earth, we have discovered that the form is not exactly that of a sphere. The length of a degree increases as we proceed from the equator toward either pole. We hence infer that the earth is flattened about the polar regions, and more convex between the tropics. The average length of a degree is 69 1-15th miles. But the length of a degree in latitude 66°, is about two-thirds of a mile greater than at the equator. The same phenomenon is indicated also by the pendulum. A clock which keeps correct time at the equator, is found to gain more and more as it is carried toward either pole, in consequence of a quicker motion of the pendulum, resulting from a nearer approach to the centre, and a greater power of gravity.

Is the earth solid or hollow, and if solid, how dense is it? Would it be equivalent to so much water, or would it exceed it, and how much would it exceed it? It may seem very difficult to answer these questions, and yet they have been answered most satisfactorily. It is now abundantly proved, not only that the earth is solid, but that the interior parts are more and more compact the nearer we approach to the centre, as we should naturally suppose. We are able to estimate the influence which a mountain exerts upon a plumb-line, by observing how much it is drawn out of the direction of an exact perpendicular; and then, by comparing the size of the mountain with the size of the earth, knowing at the same time of what materials the mountain is composed, we are able to say how much the matter of the whole earth exceeds that of the mountain. It is thus ascertained that the matter composing the earth is about five times as dense as water, or, in other words, would weigh, under the same circumstances, five times as much as the same bulk of water. Now we know that the matter near the surface, is, for the most part, either water or earthy and stony substances, only two or three times as heavy as water. The density of the interior parts, therefore, must greatly exceed that at the surface, in order that the average may amount to five times the density of water, as is ascertained by actual observation.

It may be thought that the above method of determining the quantity of matter in a mountain is liable to great uncertainty. It should be known that we do not rely upon a single experiment, or even upon one single method, for so important a result. A balance has been contrived, depending upon the twisting and untwisting of an extremely fine wire suspended perpendicularly,* by which the mutual tendency (or relative weight) of two balls of lead, has been accurately estimated and compared with the force exerted by the great mass of the earth; and these delicate experiments have afforded a striking confirmation of the result above stated.

* A balance of this construction, applied to electrical forces, has been estimated to weigh to the sixty-thousandth part of a grain.

PREJUDICE, THE SPIDER OF THE MIND.

Of Prejudice it has been truly said, that it has the singular ability of accommodating itself to all the possible varieties of the human mind. Some passions and vices are but thinly scattered among mankind, and find only here and there a fitness of reception. But prejudice, like the spider, makes every where its home. It has neither taste nor choice of place, and all that it requires is room. There is scarcely a situation, except fire and water, in which a spider will not live. So, let the mind be as naked as the walls of an empty and forsaken tenement, gloomy as a dungeon, or ornamented with the richest abilities of thinking; let it be hot, cold, dark, or light, lonely or inhabited; still prejudice, if undisturbed, will fill it with cobwebs, and live, like the spider, where there seems nothing to live on. If the one prepares her food by poisoning it to her palate and her use, the other does the same; and as several of our passions are strongly characterised by the animal world, prejudice may be denominated the Spider of the Mind.—*Retrospective Review.*

SIR WALTER SCOTT.

Sir Walter Scott used to repeat the following striking lines, as an ancient inscription found at Melrose Abbey:—

The earth goeth on the earth, glistering in gold;
The earth goes to the earth sooner than it wold;
The earth builds on the earth castles and towers;
The earth says to the earth—"All shall be ours!"

Edinburgh: Published by William and Robert Chambers, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, John Macleod, 20, Argyle Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In London, an Edition is published, with the permission of the Proprietors, by Smith & Orr, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company. Paul's Work.

No. 87. SATURDAY, SEPTEMBER 28, 1833. PRICE THREE HALFPENCE.

SAVING.

A MAN is very apt to deceive himself into an idea that he *cannot* save, and that it is of no use attempting it. He convinces himself that his income is little enough for present necessities, and puts off the hope of accumulation, if he forms it at all, to that happy period when he shall be in somewhat better circumstances. His circumstances *do*, perhaps, improve; but his wants have extended as much, and still the time for saving is far ahead. Thus he goes on and on, resolving and re-resolving, until he is at last surprised by some sudden calamity which deprives him even of his ordinary earnings, or by death, which cruelly cuts him off in the very midst of the best intentions in the world.

Did any man, we would ask, ever experience a falling off in his income, even to so small an amount as a shilling in the week? Many answer they have. Did they continue to live at that reduced rate? They reply, We did so—we were compelled to do it. Very well; and pray what is the difference between being compelled to live a shilling a-week cheaper, and compelling yourself to do it? Or suppose a stationary wage, and a rising corn-market. Did you not find, that, though bread rose a penny or two per loaf, and other provisions in proportion, you still contrived to make your income procure something like the usual exhibition of victuals? You answer, Yes. And where, I would ask, is the difference between spending a small extra sum upon certain articles of food, and laying it by for accumulation, supposing it not to be so needed? It is clear, that, if you had the fortitude and strength of character to make the saving as much a matter of compulsion as the other circumstances are, you *would* save. You have, therefore, no excuse to present for your *not* saving, except that you are too weak-minded to abstain from using money which is in your power.

And yet of what infinite importance is saving, both for the community and for individuals! Without saving, which produced capital, we should yet have been all in the condition of herdsmen and hunters. Every man would have had to labour for himself. There would have been no systematic labour—no combined efforts—no public works—no men paying wages to others. All the improvements conferred on the earth by culture, by roads, by cities, by factories, by the arts of refinement, are the offspring of SAVING—and these would have all been wanting. Such—such is the mighty general good which has resulted from this virtue, too often stigmatised for its mean or its magnificent views, for its paltry stinginess, or its grasping ambition! Nor is it less beneficial to individuals. What, let us inquire, is the condition of a working man who never attempts to save? He of course gives up all hope of ever being better, or more his own master, than he is. But that is not all. He deliberately encounters the almost certain prospect of coming to a much less happy condition. When old age overtakes him—as it must, if he be spared by the pressure of long-continued toil—he becomes a burden either upon some public establishment or upon some individual—a condition alike odious to himself and to those whom he burdens—a condition unjust, unnatural, and destructive of all right principle and manly feeling. To live, indeed, without saving, is to live the life of a slave—with only this difference, that, by the former plan, you are not equally provided against the contingencies of sickness, and lameness, and the certain infirmities of old age.

There would be much more saving, we believe, than there is, if men would only make a beginning. Perhaps they never can by any means spare above a mere trifle at any given time, and that they think *too small to be worth laying by*. If they were suddenly to become possessed of a larger sum, it might put them into heart, as one would say, and they would then go on very prudently, adding every week what they could avoid spending. Thus we have known a man, who had all his life only intended to save, having suddenly got five pounds as a legacy, become all at once a noted accumulator, and end by rising to a very respectable condition in life. People who have the disposition to save, ought to struggle with the weakness of supposing that any sum is too little to lay by. Little as it may be by itself, the next similar sum doubles it exactly, and when once it is a little way on, it is not only safe itself, but every subsequent spare shilling is safe too. Why, if there is no other way of getting into conceit with this excellent habit, cannot a workman leave over a small part of his wages every week with his employer, till the necessary kernel is accumulated? Only, by whatever means, make a beginning. Nothing can be done without that. And when that is done, the turn is half ended.

Working men should have it always present before their eyes, that *saving* constitutes all the difference between themselves and their employers. A human being, thrown into a civilised part of the world without any thing but his native strength, finds every thing appropriated already, and no man will give him any thing without an equivalent in labour. Labour, then, is his doom, till he can himself save or accumulate something. The more he accumulates, be it skill, or character, or money, the more independent he becomes, and the more qualified to be director of the labour of others. When he has realised some little capital, he employs it as a master, and increases it by taking advantage of the moneyless condition of those whom he himself lately resembled. This is the way of the world, and no man can attempt other expedients for advancing himself without ruin sooner or later. Let no labouring man despair of the course here pointed out. It is well known that many of the principal manufacturers in England were originally workmen, and rose to the extensive command which they now have over the labour of others, purely by that easiest of all devices—a little saving from their weekly income. In many other cases, it is found that these enviable men are the sons of manufacturers, who once were workmen; and whether capital be in the hands of its actual creator, or of one who only inherits it, still it is equally the result of *saving*. But what need is there for further argument with the man who does not save, than to show him that there are some of his own rank who do? In England, there is above thirteen millions of money in the public funds, which has been deposited there, through Savings Banks, during about twenty years; and all, or most of that sum, is the property of working men. Some individuals have so much as two hundred pounds laid aside for future use—and enviable men are they—enviable alike for their proud and self-gratulatory feelings, and for the assurance they possess that they can hardly ever cease to be independent. The general average of the deposits is only thirty-four pounds; but even that is a wonderful protection against the evils of a laborious life.* A man possessed of this sum can never be the slave of any one master, or the bondsman of any unprosperous locality. If a master should try to injure him, he can afford to take his chance of being a fortnight without one. He can, in fact, make his choice of masters. If any personal distress comes upon him, he is not reduced at once into the unhappy condition of a pauper; he does not re-appear among his fellows with the ignominious stigma of charity stamped on his honest face, and continue for ever after a degraded being in his own eyes. He is in reality rich—for to have more than we require to spend, is riches. It is from this prudent and right-spirited class of men that many of our future "masters"—many of our future gentry and nobles—are to arise.

There is one class of persons whom it becomes, above all others, to save—we mean the fathers of families. Many men encounter the responsibilities of this situation—which it cannot be supposed they would do, if they did not expect advantages equivalent to the responsibilities—without ever thinking, or *only* thinking, of providing for the discharge of those responsibilities in the event of their decease. They blindly and shamefully live on from day to day, under the hazard of leaving their families next hour—next moment—to the charity of a world, each individual of which reasonably declares that he has enough to do in providing for his own. If the world had a little more reflection, and saw a little more clearly the relative duties of men, it would visit conduct of this kind with a degree of the very same reprobation which it inflicts upon flagrant dishonesty, open cruelty, or actual desertion. Perhaps, if downright saving were necessary for guarding against the destitution of an orphan family, there would be a better excuse for not resorting to it. But this is not the case. There are now institutions of all kinds, which, for wonderfully small entrance-sums or annual payments, afford assurance against the current risk of death, and preclude the necessity of amassing a full provision in money. Into one or other of these institutions, every man in the enjoyment of an income has it in his power to enter. If he does not, but persists in sacrificing every penny of his earnings in the indulgences of the passing day, he deserves, even during his life, the execrations of all good men, and, after his death, a public mark of infamy.

* The total sum deposited in English Savings Banks amounts to L.13,080,255. The depositors are in number 367,812, being an average of L.34 for each. There are, however, 4237 who have above L.200 each in these banks; 7627 who have more than L.150; 17,214 who have above L.100; and 102,621 who have above L.50. The number of those who have less than L.20 is 187,770. The total of Savings Banks in England is 394; besides which, there are a number of friendly and charitable societies, whose deposits are included in the above calculation. In Wales there are 25 Savings Banks, possessing in all L 314,903. In Ireland, there are 73 Savings Banks, possessing L.905,056. The increase of both depositors and deposits is very remarkable.

NATURE'S MAGIC LANTERN.

By the Ettrick Shepherd.

IT is well known, that, in warm summer mornings, the vallies among our mountains are generally filled with a dense white fog, so that, when the sun rises, the upper parts of the hills are all bathed yellow sheen, looking like golden islands in a sea of silver. After one ascends through the mist to within a certain distance of the sunshine, a halo of glory is thrown round his head, something like a rainbow, but brighter and paler. It is upright or slanting, as the sun is lower or higher; but it uniformly attends one for a considerable space before he reaches the sunshine. One morning, at the time when I was about nineteen years of age, I was ascending a hill-side towards the ewe-buchts, deeply absorbed in admiration of the halo around me, when suddenly my eyes fell upon a huge dark semblance of the human figure, which stood at a very small distance from me, and at first appeared to my affrighted imagination as the enemy of mankind. Without taking a moment to consider, I rushed from the spot, and never drew breath till I had got safe amongst the ewe-milkers. All that day, I felt very ill at ease; but next morning, being obliged to go past the same spot at the same hour, I resolved to exert, if possible, a little more courage, and put the phenomenon fairly to the proof. The fog was more

dense than on the preceding morning, and when the sun arose, his brilliancy and fervour were more bright above. The lovely halo was thrown around me, and at length I reached the haunted spot, without diverging a step from my usual little footpath; and at the very place there arose the same terrible apparition which had frightened me so much the morning before. It was a giant blackamoor, at least thirty feet high, and equally proportioned, and very near me. I was actually struck powerless with astonishment and terror. My first resolution was, if I could keep the power of my limbs, to run home and hide myself below the blankets, with the Bible beneath my head. But then again, I thought it was hard to let my master's 700 ewes go eild for fear of the de'il. In this perplexity (and I rather think I was crying) I took off my bonnet, and scratched my head bitterly with both hands; when, to my astonishment and delight, the de'il also took off his bonnet, and scratched his head with both hands—but in such a style! Oh, there's no man can describe it! His arms and his fingers were like trees and branches without the leaves. I laughed at him till I actually fell down upon the sward; the de'il also fell down, and laughed at me. I then noted for the first time that he had two colley dogs at his foot, bigger than buffaloes. I arose, and made him a most graceful bow, which he returned at the same moment—but such a bow for awkwardness I never saw! It was as if the Tron Kirk steeple had bowed to me. I turned my cheek to the sun as well as I could, that I might see the de'il's profile properly defined in the cloud. It was capital! His nose was about half a yard long, and his face at least three yards; and then he was gaping and laughing so, that one would have thought he might have swallowed the biggest man in the country.

It was quite a scene of enchantment. I could not leave it. On going five or six steps onward, it vanished; but, on returning to the same spot, there he stood, and I could make him make a fool of himself as much as I liked; but always as the sun rose higher, he grew shorter, so that, I think, could I have staid, he might have come into a respectable size of a de'il at the last.

I have seen this gigantic apparition several times since, but never half so well defined as that morning. It requires a certain kind of background which really I cannot describe; for, though I visited the place by day a hundred times, there was so little difference between the formation of that spot and the rest of the hill, that it is impossible to define it without taking a mathematical survey. The halo accompanies one always, but the gigantic apparition very seldom. I have seen it six or seven times in my life, always in a fog, and at sun-rising; but, saving these two times, never well defined, part being always light, and part dark.

One-and-twenty years subsequent to this, I was delighted to read the following note, translated, I think, from a German paper, concerning the Bogle of the Broken, an aërial figure of the very same description with mine, which is occasionally seen on one particular spot among the Hartz mountains, in Hanover. It was taken from the diary of a Mr Hawe, and I kept a copy of it for the remembrance of auld lang syne. I shall copy a sentence or two from it here; and really it is so like mine, that one would almost be tempted to think the one was copied from the other.

"Having ascended the Broken for the thirtieth time, I was at length so fortunate as to have the pleasure of seeing the phenomenon. The sun rose about four o'clock, and the atmosphere being quite serene toward the east, his rays could pass without any obstruction over the Hinrichshohe. In the south-west, however, a brisk wind carried before it thin transparent vapours. About a quarter past four, I looked round to see if the atmosphere would permit me to have a free prospect to the south-west, when I observed, at a very great distance, a human figure, of a monstrous size. A violent gust of wind having nearly carried away my hat, I clapped my hand to it, by moving my arm towards my head, and the colossal figure did the same, on which the pleasure that I felt cannot be described; for I had made already many a weary step, in the hopes of seeing this shadowy image, without being able to gratify my curiosity.

"I then called the landlord of the Broken (the neighbouring inn), and having both taken the same position which I had taken alone, we looked, but saw nothing. We had not, however, stood long, when two such colossal figures were formed over the above eminence. We retained our position, kept our eyes fixed on the same spot, and in a little time the two figures again stood before us, and were joined by a third. Every movement that we made, these figures imitated, but with this difference, that the phenomenon was sometimes weak and faintly defined, and sometimes strong and dark."

I can easily account for the latter part of the phenomenon; for it could only be when the clouds of haze, or, as he calls them, "thin transparent vapours," were passing, that the shadows in the cloud could possibly be seen. But how there should have been *three* of them, and not either four, or only two, surpasses my comprehension altogether. It is quite out of nature; and I am obliged to doubt either Mr Hawe's word or the accuracy of his optics.

Among the other strange sights which I have seen among the hills, I reckon one of the most curious to have been a double shadow of myself, at a moment when only the real sun was above the horizon. One morning, in April 1785, I was walking on the Moor-Brae of Berry Knowe, gathering the ewes, when, to my utter astonishment, I perceived that I had two shadows. I immediately looked to the east, where the sun had just risen above the horizon, expecting to see two suns. But no—there was but one. There was not even one of those mock suns called by us weather-gaws. Yet there was I going to a certainty with two shadows—the one upright, and well defined, and the other tall, dim, and leaning backward, something like a very tall awkward servant waiting upon and walking behind a little spruce master. The tall one soon vanished, as I turned the hill into a glen called Carsen's Cleuch; but I never forgot the circumstance; and after I became an old man, I visited the very spot, as nearly as I could remember, again and again, thinking that the reflection of the sun from some pool or lake which I had not perceived, might have caused it; but there was no such thing. I never mentioned the circumstance to any living being before, save to Sir D. Brewster, who, of all men I ever met with, is the fondest of investigating every thing relating to natural phenomena: he pretended to account for it by some law of dioptrical refraction, which I did not understand.

But what I am now going to relate will scarcely procure credit, though, on the word of an honest man, it is literally true. I once saw about two hundred natural apparitions at one time, and altogether. One fine summer morning, as I was coming along the Hawkshaw rigg of Blackhouse, I perceived, on the other side of Douglas Burn, in a little rich glen called Brakehope, a whole drove of Highland cattle, which I thought could not be fewer than ten scores. I saw them distinctly—I never saw any beasts more distinctly in my life. I saw the black ones, and the red ones, some with white faces, and four or five spotted ones. I saw three men driving them, and turning them quietly in at corners. They were on each side of the burn of Brakehope, and quite from the drove road. I was once thinking of going to them myself, but I wanted my breakfast, was very hungry, and had no charge of that part of the farm: so I hastened home, and sent off the shepherd who had the charge of it, to drive the drove of cattle from his best land. His name was Robert Borthwick. He seized a staff in high chagrin at the drivers, and ran off; and Messrs William and George Laidlaw both accompanied him, with good cudgels in their hands. They are both alive and well to testify the truth of my report: at least, when they went to Brakehope, there were no cattle there, nor man, nor dogs, nor even sheep! There was not a living creature in the bottom of the glen where I had seen the drove, nor the mark of a cow's hoof. I was of course laughed at as a dreamer and seer of visions; for, in fact, after inquiring at our neighbours, we found that there was not a drove of Highland cattle at that time in the district. I was neither a dreamer nor a seer of visions. I was in the highest health and spirits. It was between eight and nine o'clock on a fine summer morning of mingled clouds and sunshine. I was chaunting a song to myself, or perhaps making one, when I first came in view of the drove. I was rather more than half a mile from it, but not three quarters of a mile; and as there never was a man had clearer sight than I had, I could not be mistaken in the appearance. In justification of myself, I must here copy two or three sentences from my note-book; but from whence taken, I do not know.

"On Sunday evening, the 28th ultimo, as Anthony Jackson, farmer, aged forty-five, and Matthew Turner, the son of William Turner, farmer, aged fifteen years, while engaged in inspecting their cattle grazing in Havarah Park, near Ripley, part of the estate of Sir John Ingleby, Bart., they were suddenly surprised by a most extraordinary appearance in the park. Turner, whose attention was first drawn to the spectacle, said, 'Look, Anthony, what a quantity of beasts!' 'Beasts!' cried Anthony; 'Lord bless us, they are not beasts, they are men!'

"By this time the body was in motion, and the spectators discovered that it was an army of soldiers dressed in a white military uniform, and that in the centre stood a personage of commanding aspect, clothed in scarlet. After performing a number of evolutions, the corps began to march in perfect order to the summit of a hill, passing the spectators only at the distance of about one hundred yards. No sooner had the first detachment, which seemed to consist of several hundreds, and extended four deep over an inclosure of thirty acres, attained the hill, than another assemblage of men, far more numerous than the former, arose and marched without any apparent hostility after the military spectres. These were dressed in a dark uniform, and, at the top of the hill, both parties joined, and formed what the spectators called an L, and, passing down the opposite side of the hill, disappeared. At this time a volume of smoke, like that vomited by a park of artillery, spread over the plain, and was so impervious, as for two minutes to hide the cattle from Jackson and Turner. They were both men of character and respectability, and the impression made on their minds was never erased."

In addition to this, I may mention, that, during the last continental war, all the military and volunteers in Ireland were hurried to the north to defend the country against a spectre fleet, which had no existence in those seas. And I find, likewise, in my note-book, the following extraordinary account, which I think was copied long ago from a book called "A Guide to the Lakes of Cumberland." I was always so fond of those romantic and visionary subjects, that I have added thousands of *lees* to them, but in this I shall not deviate one word from the original writer's narrative.

"Souter Fell is nearly nine hundred yards high, barricaded on the north and west sides with precipitous rocks, but somewhat more open on the east, and easier of access. On this mountain occurred the extraordinary phenomena, that, towards the middle of the last century, excited so much consternation and alarm—I mean the visionary appearances of armed men, and other figures, the causes of which have never in the smallest degree received a satisfactory solution, though, from the circumstances hereafter mentioned, there seems reason to believe that they are not entirely inexplicable.

"On a summer's evening of 1743, as David Stricket, then servant to J. Wren of Wilton Hall, the next house to Blakehills, was sitting at the door with his master, they saw the figure of a man with a dog, pursuing some horses along the side of Souter Fell, a place so steep that no horse can travel on it. They appeared to run at an amazing pace till they got out of sight at the lower end of the Fell.

"The next morning, Stricket and his master ascended the steep side of the mountain, in full expectation that they should find the man lying dead, as they were persuaded that the swiftness with which he ran must have killed him. They expected likewise to find several dead horses, and a number of horse-shoes among the rocks, which they were sure the horses could not but throw, galloping at such a furious rate. They were, however, disappointed, for there appeared not the least vestige of either man or horse, not so much as the mark of a horse's hoof on the turf, or among the small stones on the steep. Astonishment, and a degree of fear perhaps, for some time induced them to conceal the circumstances; but they at length disclosed them, and, as well might be supposed, were only laughed at for their credulity.

"The following year, 1744, on the 23d of June, as the same David Stricket, who at the time lived with Mr William Lancaster's father, of Blakehills, was walking a little above the house, about seven in the evening, he saw a troop of horsemen riding on the side of Souter Fell, in pretty close ranks, and at a brisk pace. Mindful of the ridicule which had been excited against him the preceding year, he continued to observe them in silence for some time; but being at last convinced that the appearance was real, he went into the house, and informed Mr Lancaster that he had something curious to show him. They went out together, but before Stricket had either spoken or pointed out the place, his master's son had himself discovered the aërial troopers; and when conscious that the same appearances were visible to both, they informed the family, and the phenomena were alike seen by all.

"These visionary horsemen seemed to come from the lower part of Souter Fell, and became visible at a place called Knott. They then moved in regular troops along the side of the Fell, till they came opposite to Blakehills, when they went over the mountain. Thus they described a kind of curvilineal path, and both their first and last appearances were bounded by the top of the mountain.

"The pace at which these shadowy forms proceeded, was a regular swift walk, and the whole time of the continuance of their appearance was upwards of two hours; but farther observation was then precluded by the approach of darkness. Many troops were seen in succession; and frequently the last, or the last but one, in a troop, would quit his position, gallop to the front, and then observe the same pace with the others. The same changes were visible to all the spectators, and the view of the phenomena was not confined to Blakehills only, but was seen by every person at every cottage within the distance of a mile. The number of persons who witnessed the march of these aërial travellers was twenty-six."

It would therefore appear that my vision of a drove of Highland cattle, with their drivers, was not altogether an isolated instance of the same phenomena. It is quite evident that we must attribute these appearances to particular states of the atmosphere, and suppose them to be shadows of realities; the airy resemblance of scenes passing in distant parts of the country, and by some singular operation of natural causes thus expressively imaged on the acclivities of the mountains.

A TALE OF CLYDESDALE.

In the Upper Ward of Clydesdale, on the very edge of a steep bank, at the foot of which runs a considerable stream, and on two sides closely embosomed in a thick wood of stately trees, stands an old dark and time-worn castle, still, however, sometimes inhabited for a short time during the shooting season, by the nobleman whose ancestors erected it. A summer tour, many years ago, led me into the vicinity of this ancient building; and as it had been a celebrated stronghold of one of the most renowned and powerful families in the kingdom, I felt an irresistible desire to visit it. It was at that time entirely deserted, except by two old domestics, a man and a woman, and exhibited all the tokens of neglect which are generally manifested in a place which has fallen under the misfortune of being forsaken for more modern and gayer dwellings. On making an application at the castle for permission to see its interior, I was much struck with the venerable countenance, the white hairs, and the grave and respectable appearance of the aged man, who, with an air of ceremonious deference, admitted me, and became my guide through its various apartments. If I at first thought him somewhat formal and taciturn, I had no occasion to complain of these freezing qualities when we entered a large apartment, and he began to recount the exploits of the ancient heroes whose dark portraits ornamented the walls, and perceived that I was nearly as well acquainted with them as himself. This historical knowledge of the family on my part seemed to establish me immediately in the good opinion of my guide, and he became animated with a sort of gratified pride as we discussed the merits of each individual named by him.

At length, after having gone over all those who had figured down to the time of Charles the First, we arrived at some which he walked quickly past, as if anxious to hurry over them with as little notice as possible. "This," said he, of one of these pictures, "was the first wife of that earl next her, and that lady on his other side was his second wife, and that gentleman on the other hand of her was a relation of the family." He then became more communicative with regard to the next picture in rotation.

Meanwhile, I had stopped to contemplate the first of the four portraits which he seemed so unwilling to notice. It was that of a very young woman of a remarkably sweet but melancholy countenance; and my curiosity being raised, I called him back, to ask if he had nothing to relate of those whose resemblance he had thus hurried past.

"Ah, there is enough to tell about them, but no good, and I never care to repeat the tale," said the old man, mysteriously shaking his head, half closing his eyes, and compressing his lips.

"There *is*, then, some story that belongs exclusively to these four portraits," said I.

The old man came to my side, and, pointing up with his finger to the picture of the man which hung between his two wives, he said, in a subdued tone of voice, "That is the 'Bloody Earl,' and strange and horrible things went on in this castle while he possessed it."

"I am very fond of hearing such stories," said I, taking out my purse, and presenting him with two dollars, "and I shall think myself indebted to you if you will relate to me all you have hinted at."

"Put up your purse, sir," he said, as if his pride was hurt by my offer; "I never take money from strangers; and if I felt rather unwilling to satisfy your curiosity with regard to what formerly happened here, it was because I am not in the habit of mentioning it. But as you seem to be anxious about it, and to be so well acquainted with the history of the family, I will satisfy you. But first take a look of these four pictures, for I always think I see their history in their faces."

"Well, then," I replied, "let me try if I can read any thing of their fortunes in the same way. And to begin with this young lady: she looks gentle and patient, and as if by that melancholy smile she was trying to conceal some inward sorrow."

"Right," responded the old man.

"And this 'Bloody Earl,' as you have called him, has a singular expression in those large gloomy eyes, as if of incipient madness; and that stern mouth, which looks as though it could not smile, gives, with the deep markings at its corners, and the dark sallow hue of the complexion, a look of sullen malignity to the countenance, which seems to breathe a death-chill on the beholder."

"Go on, sir," said my guide.

"But as to this lady on his left hand, I see in her only a somewhat bold-looking beautiful woman, who seems to be demanding admiration of her charms, and, perhaps, of the style with which she has been playing on the lute she holds in her hands." An affirmative nod was all the notice taken of these remarks, and I passed on to the next picture.

"And here," I continued, "I alone perceive a very handsome young fop of his time, who seems, by his long curled hair, his profusion of embroidery and lace, and the number of rings on his slender white fingers, to have set off his person to the best advantage."

"You shall judge presently, sir," said my cicerone, as soon as I had finished my comments, "in how far these pictures speak for themselves; but, in the meantime, I will conduct you to a part of the castle you have not yet seen." The apartments to which he next carried me were those which had been formerly the finest in the castle, and were, he informed me, most inhabited by the personages of whom we had been last speaking. They were large, and had been furnished most sumptuously; but their magnificence was now tarnished and faded, and the whole appeared so gloomy, that they seemed like the very mansions of death. The old man pointed out to me, in the last room to which he led me, some dark spots on the oaken floor, which he assured me were blood-stains. There is hardly an ancient mansion to be met with free from such sanguinary marks, and I paid but small attention to them, being anxious to hurry through the rooms, that my guide might have leisure to begin the story he had promised me. This was the very chamber, however—by way, I suppose, of making it more impressive—in which he had determined to tell it; and having requested me to seat myself in a high-backed chair which stood by the side of the bed, and apologised for sitting down himself, on account of his age, he took possession of a low seat at some little distance from mine, and leaving, by his position, the blood-stains, which were by the bedside, full in my view, he began the recital of his extraordinary tale.

"You must know, sir, that I am the third generation of my family who have served this noble house, and that it was from my father, to whom my grandfather told it, that I learnt what I am about to make known to you, and which, as a faithful servant, I should not perhaps have thought myself at liberty to divulge to any one, had the title and estates continued to descend from father to son in the old line; but they have passed to another branch of the family, who heed little the mention of such old stories. My grandfather was not above five years older than the Bloody Earl, and brought up from a boy to attend upon him as his confidential servant. Thus it was that he had more to say with him than any one else, and enough to do he had to try to keep him out of mischief, for he was even in his childhood of such a singularly cruel disposition, that, not content with torturing the dumb animals, he used to delight in beating and maiming all the country boys that came in his way, which his attendant was obliged to find some way of making up for to their parents. When he grew up to man's estate, this disposition showed itself in the many duels he fought with other young men, and in his always preferring to use the sword, because it was more butcher-like. About the time, however, of his father's death, and his coming to the title, his nature seemed to be perfectly changed, for he then fell desperately in love with the Lady Mary, whose picture you passed so just a judgment on; for she liked some other person, and it was only, they said, by her father's command that she married the earl; and, indeed, it looked like it, for though she was greatly beloved for her kind heart, and her mild and sweet manners, she always seemed so broken-spirited, that it would have touched the hardest heart to look upon her. Well, the earl continued to doat upon his lady for some months after his marriage, and to seem quite a different man. Then he grew dissatisfied, because his wife did not look happy; and again all his ferocious nature returned with tenfold fury, just as you have seen some fierce wild animal that seemed to have been tamed for a little, break out again, and be more dangerous than ever; and he would kill his most favourite horses and dogs on the most frivolous pretence, or on none at all, when that fit was on him, and would threaten the lives of his domestics, so that they dared not appear in his sight; but he never offered to harm my grandfather, who was a pious man, and who could not bear to leave him, because he had been in a manner brought up with him, and, as he minded him more than any body, he always hoped, one day or other, to see him mend by his good advice; but, alas! that day never came. Well, sir, to continue, the poor young lady we were speaking of had not been married to him a twelvemonth, when she was found one morning dead in her bed, and every body thought she had died of a broken heart, for being crossed in her first love. But my grandfather would have been of a different opinion, only that there were no marks of violence about her, and that she looked so calm, just as if she were asleep, and that there was nothing discomposed about that bed, beside which you are sitting."

"What," said I, feeling much interested in what he had told me of the unfortunate young lady, "was it on this bed, then, that she drew the last breath of her ill-fated existence! But you have said there were no marks of violence: from whence, then, came the blood-stains on the floor?"

"That blood," replied the old man, "was not hers—but you shall hear. The lady was no sooner dead, than a change again came over the Bloody Earl, and he grew sullen and moping, and would see no one but his usual attendant, and shut himself up, and would never go out but in the night, to walk among the dark cliffs and woods, and often it was thought he would take his own life. So, after he had lived in this way for two or three years, the gay young gentleman, who was his cousin, and whose picture is on the left of the earl's second wife, came to the castle, and he made shift to see him, in spite of his orders to the contrary, and when it was thought he would have killed him for it: in place of that, he took wonderfully to him, and turned so fond of him, that he could not bear him out of his sight; and then he began to get gradually more sociable; and when the next winter came, every one was surprised when his young relation got him persuaded to go with him to London—for the young man was an Englishman, the son of the sister of the earl's father, who married a nobleman of that country. It was in the swaggering wicked times of Charles the Second, after his restoration; and so, in his carousings at the court, the earl's young cousin introduced him to the lady whose picture you thought looked so bold. And bold and bad enough she was, for it was pretty well known that she had been one of the king's attendants. She was reckoned very beautiful, and she played upon the lute and sung to it in such a wonderful manner, that it seemed to bewitch every one who heard her. At length, she so far charmed the earl, that he married her, and brought her straightway down to this castle, and his gay young cousin came with them. And then there were such doings as these old walls had never witnessed before, and the earl seemed never to take one moment to think, for multitudes of company, and balls, and masquerades, and hunting, and gambling, and all manner of godless doings, that were enough to terrify any wise man to behold. But in some months my lady tired of this place, and would go to London again, and the earl would not consent, but swore nothing should make him leave it; and so there grew upon that, great disagreement between them; and she, being a daring woman, what did she do but set fire to the castle with her own hands, in hopes of obliging the earl to quit it! The fire was, however, discovered before it had done much damage, though some of the under apartments are still blackened by the smoke. Well, in this scheme of going to London her husband thought she was partly prompted and abetted by his cousin, and so he hated as much as he had ever loved him, and then again he began to resume his old ferocious habits, and act and speak like the 'Bloody Earl.' The room where my grandfather slept was close to the earl's, and he always burnt a lamp; and being one night waked out of his sleep by the opening of the door, he looked up, and saw the earl enter, with his dark eyes all bloodshot, and flashing with terrible and savage brightness, and his whole body trembling with the rage of his heart; and my poor grandfather grew sick with terror, not that he feared for himself, but he felt sure that his master had been about some murderous work; and the more so, that, being half undressed, the breast and sleeves of his shirt were all sprinkled with blood, as though it had spouted out upon him from wounds he had been inflicting on some one. But the earl left him little time for conjecture, as he told him directly, with diabolical satisfaction, that he had just *done for his cousin*. Upon that, my grandfather started out of bed, and passing the earl, flew up to this room, in the hope, that, if life was not quite extinct, something might be done for the poor young man; but it was too late; the last spark of life had flowed out at his veins, for he was stabbed in many places, and the bed and this floor were drenched in his blood. And there he that was so young, and had been so gay and so thoughtless but the night before, lay with his shirt all open and torn in the struggle, his breast covered with wounds, and his long, curled, and sweet-scented hair, that he used to be so proud of, all matted with gore."

"Now, then," said I, wound up to the last pitch of horror and disgust, "the brutal miscreant would surely meet his reward. He would be hanged at last."

"One would have thought so indeed," replied the old man; "but that was a reign when money could do any thing; and so the 'Bloody Earl' bought himself off with a great ransom from his just punishment, and got the king's pardon under pretence of derangement, and on bail for a great sum being given by his wife that she would keep him under confinement in this castle during the rest of his life: and so some rooms were fitted up for him below, and strongly secured with bolts and bars; and the iron-hearted woman, his wife, used to come here sometimes with company in the summer time, and never saw him; and then it was that his fearful punishment came, when he heard the revellings above his head in the castle, and knew she was there, and could now go and come without his control. But when she was gone again, then he used sometimes to calm down, for he was no more deranged than he had always been. And when his old attendant, for he still remained faithful to him, and still waited on him, thought he saw his opportunity, he used to try to bring him to a better mind; but when he spoke to him of repentance, of faith, and of pardon from above, he was always distressed, and disappointed in his hopes of any good change, for he got quite furious, and used to utter such dreadful words as made him shudder; and my grandfather, who could not help feeling attached to him, because he had always, even in his worst moods, shown regard for him, used to take on sadly when he considered his wretched and lost condition, and always thought, that, though his singular blood-thirsty propensity seemed in a manner natural, yet it and his other evil habits might have been corrected and got much the better of, if he had not been so foolishly indulged in his childhood and

youth by his doating parents. But I have not told you all his evil yet; for, after he was shut up, he confessed to my grandfather that he had destroyed his first sweet wife, by giving her a sleeping draught, and then running a long gold wire through her heart, because he was jealous of what he considered her continued attachment to her first love; and that he had murdered his cousin from the same motive of jealousy. Now, sir, to finish my strange and melancholy story, the earl, after he had been two years shut up, grew mad in reality, and then he wore himself out in his furious fits of impotent rage, and wasted away, and soon died; and they said his last bad lady came to great want before she left the world, by means of her gambling and other extravagances."

As I threw a backward glance, when I had left the castle, on its noble avenue of gigantic trees, where the rank and tall weeds were growing unmolested, and on the ancient pile, whose stately towers showed, by the weather stains on their grey stones, that decay had begun its work of destruction, and thought on the gay and grand carousals that had once been held there, I felt, while the story of some of its unhappy inmates was still fresh in my memory, the small necessary connection of rank and wealth with happiness and virtue, and felt grateful that I had been born in that mediocrity of station, where I was not tempted by worldly greatness to forget the paths of rectitude.

SCOTTISH STREAMS.

THE FORTH.

THE Forth is generally held the second of Scottish rivers, though the Clyde may perhaps be fully as much entitled to precedence after the Tay. The Forth is at least one of the most distinguished streams on the east side of Scotland, and, with its firth or estuary, is frequently the object of historical notice. It has its chief sources in two upper branches, one of which rises like a rill from the north side of Benlomond, and flows through the north-western part of Stirlingshire, in an easterly direction, under the appellation of the Water of Duchray, till it joins the other branch above Aberfoil. This second arises in Loch Chon, further to the north, and, after falling over a precipice, forms first Loch Ard, and then several smaller expansions. Being joined, the united stream receives the name of the *Avondow*, or *Black River*, which it retains for five miles, till it reaches Gartmore, when the title of the Forth is conferred on it. Besides receiving accessions from various small tributaries, it receives some large streams before reaching Stirling, as the Goodie, the Teith, and the Allan. In many places it serves as the boundary between Perthshire and Stirlingshire, but it chiefly belongs to the latter county.

As the Forth approaches Stirling, it becomes a solemn dull river, of a blackish colour, very much resembling some of the sluggish waters in England. It flows through a rich flat district of country, mostly of an alluvial soil, and winds in the most capricious manner amidst corn fields and verdant meadows. Above and below Stirling, these windings or *links* are extremely beautiful, the water describing a long series of sweeps, which are all but formed into perfect circles. In sailing along its serpentine course to or from Stirling, the stranger is puzzled and amused to the last degree by the variety of positions into which he is thrown in regard to the surrounding objects—Stirling for instance being at one moment full in his eye, and the next at his back—while all observation of the cardinal points is fairly out of the question. At Stirling the Forth is crossed by a stone bridge, celebrated as a very important pass. Small vessels ascend this length, and steam-boats ply at the height of the tides. The river continues in this condition for about twenty miles, or six by a direct course, to Alloa, which is the head of the regular navigation. It then expands into a bay twenty miles in length, and from two to eight in breadth. At the bottom of the bay the land projects on each side, and forms the strait called the Queensferry. This gut in the waters of the Forth measures about two miles in breadth, but is rendered much less in appearance by an island called Inch Garvie, lying nearly in the middle, between the two shores. This strait forms the great thoroughfare betwixt the south and north of Scotland, in which capacity it has been used from the most remote period. It derives its name from Margaret, Queen of Malcolm Canmore—a princess celebrated for her charitable and beneficent virtues, who frequented the passage of the Forth here on her numerous excursions to and from Edinburgh and Dunfermline.

The Forth continues contracted to about three or four miles in breadth, for a distance of four miles, when it gradually again expands into an arm of the sea or *firth*. It is now entitled the Firth of Forth; and, as it approaches Leith and Edinburgh on the south shore, and Kirkaldy on the north, swells out to from six to nine miles in breadth. From this point it continues to expand for many miles to the eastward, and is finally lost in the German Ocean at Dunbar on the south coast, and Crail on the north, draining, as it has been calculated, a superficies of 574 miles. From Alloa to its junction with the ocean, the distance may be about fifty miles. The Firth of Forth is of great importance to the country as regards navigation and commerce. In ancient times it was considered dangerous for sailing vessels, but such is no longer the case. It has shoals at different places; however, they are all correctly laid down in charts, and for this and other reasons a wreck here is nearly unknown. The only seaport of any consequence on its shores is Leith, the port of Edinburgh, half-way up on its south side. On the opposite coast of Fife, the harbours are all better than on the Edinburgh side, but they are less frequented.

The trade carried on by means of the Firth of Forth has been considerably augmented of late years by the institution of the Forth and Clyde Canal, which opens into it at Grangemouth, and gives a passage to and from Leith by water with the west of Scotland. Within the last twenty years it has been made very useful in steam navigation. At all times of the day, it presents to the eye different steam-vessels engaged in ferrying across, or in carrying passengers up and down the channel. In the mouth of the Firth lies the flat Isle of May, and between Leith and Kirkaldy lies Inchkeith, an island of several miles in circumference. Both have lighthouses. Farther up there are a few islets in different places. The whole have a bare, and generally a rocky appearance. In some, there are the remains of religious edifices. At different places on either side are fishing villages, from whence boats are sent out to sea to catch white fish, for the daily markets at Edinburgh and elsewhere. In certain seasons vast quantities of herrings are caught, most of which are sold in a fresh state. A considerable quantity of oysters are also taken in the Firth, but as regards quality and size they are generally inferior to those in many places in the United Kingdom. The Firth of Forth comes repeatedly under notice in the history of Scotland, as having been the sea which bore to the metropolis navies engaged in warring against the kingdom, or in bringing royal personages to the country.

THE KNOT-RECORDS OF PERU.

IT is generally known that the inhabitants of Peru were found, on the discovery of America, to possess a degree of intelligence and a range of social institutions, which plainly pointed out that the nation must have previously had a communication of some kind with Europe. Among the other circumstances distinguishing them from savages, was their system of recording events and conveying ideas by means of knotted cords, called *Quipos*. From the accounts left by the Spaniards who discovered the country, it appears that these *quipos* were, in general, formed of the intestines of animals, like our catgut, on which were knots and loops, the varieties of which represented letters; and there was a class of men like our notaries and clerks of council, whose business it was to compose these volumes; the name given to these officers Quipo-camayos. The knots are diversified by colours, for minute distinction. There is extant, in a Spanish work published in 1608, a minute account of all that took place at a meeting between Garcilasso de la Vega, an officer of the king of Spain, and the inca of Peru; being a transcription of the report or record taken of the proceedings by two Quipo-camayos, who sat all the time in the hall of audience, engaged upon their task. In the year 1827, there appeared in London a small quarto volume, giving an account of a bunch of these knot-records, which had fallen into the hands of one Alexander Strong, a ship-carpenter, and been brought by him to this country. The story given as to their transmission from an ancient inca of Peru, through many different hands, until they came into those of Mr Strong, need not be repeated here; but we shall give a description, so far as we are able, of the object itself.

The quipos recovered by Strong were contained in a box of wood which had been cut out of a solid block, and measured eighteen inches in length by eight in breadth and depth. On the outside were painted many apparently unmeaning figures, including one, however, of a man on horseback, which is said to be alluded to in the quipos within, as representing a dream, in which one of the Peruvian incas foresaw the arrival of the equestrian people by whom they were to be overcome.

The quipos consist of seven bunches, each of which is formed upon a ring of animal sinew, bedaubed with different paints, and measuring from three to six inches in diameter. The whole form one narrative, which begins with the smallest ring, and goes on to the largest. From the circumference of each ring, proceed from thirty to a hundred cords, exactly resembling the smallest strings of a violin; each string being from twelve to fifteen inches long, and united at both ends to the ring, so as to form what in a ribbon would be called a bow. On each string are from ten to thirty knots of different degrees of complexity, from a simple through-put, to a complication of loops and twists of three quarters of an inch in diameter. The knots and intervening portions of the string are covered with a substance which gives them the appearance of having been dipped in sealing wax: the colour being for the most part green, but in some of the knots yellow, and in others red.

Alexander Strong, who purchased them for ten pounds, from a person who had bought them at Buenos Ayres, with the hope of selling them to advantage in Britain, also received with them a key, consisting of five small slips of leather, scrawled over with something like writing; and it ought to rank high among anecdotes of perseverance, that this humble and unlettered man actually taught himself Latin, in order that he might acquaint himself with the key, which, strange to say, is in that language, and then submitted to the inconceivable drudgery of untying the whole successive parts of this worse than Gordian knot. Having first arrived at English for the various Latin words, he proceeded to apply them to the various knots which they referred to, and finally, by wonderful skill and industry, made out a rude narrative of the whole, which remains as a monument of his extraordinary task.

It appears that, in the quipos belonging to Mr Strong, proper names are given in red knots, numerals in yellow, while other parts of speech are in green. On examining the numerals in the quipos, it is found that, instead of advancing as we do by *tens*, the Peruvians advanced by *threes*; which is perhaps the reason that certain American nations have been represented as unable to count farther than three. *One* is represented by the commonest knot, such as sempstresses generally make on a thread previously to taking the first stitch. *Two* is represented by a knot, in which the end is put through once more before drawing tight, as a sempstress does when it is desired to increase the magnitude of the knot. And *three* is expressed by performing the same operation an additional time. But *four* assumes a new conformation, for it is expressed by a *loop* of the simplest kind, such as is made, in nautical language, by taking a bend on the bight of the rope; and *five* is expressed by the same kind of loop, with an additional twist in the *clinch* or part where the whole is drawn tight; and *six* has another twist still. *Seven* is another kind of loop, which is manifestly different from *four*, though it would probably puzzle a forecastle-man to define the difference in words. *Eight* is the same with the addition of another twist in the clinch, and *nine* with another. *Ten* is no loop at all, but a portentous kind of a knot, such as might be made in a cat-o'-nine-tails where the object was to kill. *Eleven* is the same with an additional twist in the *clinch*; and *twelve* with another. *Thirteen* is the same kind of knot as *ten*, only with a loop sprouting out on one side; and *fourteen* and *fifteen* distinguish themselves by their twists as before. In this manner the system goes on to a hundred—for so far the unknown apocalypst has chosen to carry his operations;—exhibiting a new knot at every third numeral, and expressing the two next by additions at the clinch. The knots, as may readily be imagined, in time grow exceedingly complicated and artificial; but they invariably adhere to the *ternary* system described.

The number of knots in the skin of proper names is 102, and in the three collections of green knots, 231; so that, with the addition of the hundred numerals, the whole number of knots or ideographic symbols is 433. The positive contents, as presented by the key, are in the main very analogous to the account of Peruvian traditions given by Humboldt and Bonpland, as follows:—"The cosmogony of the Mexicans—their traditions on the subject of the mother of mankind falling from her first estate of happiness and innocence—the notion of a great inundation, in which a solitary family escaped upon a raft—the account of a building like a pyramid, raised by the pride of mankind and destroyed by the anger of the gods—the ceremonies of ablution practised at the birth of children—their idols made of maize flour kneaded into paste, and distributed in portions to the people collected in the inclosure of the temples—their confessions of sin made by penitents—their religious associations like our convents of men and of women—the belief universally extended, that white men with long beards, and of great sanctity of manners, had changed the religious and political system of their countrymen—all these circumstances together had led the ecclesiastics who accompanied the army of the Spaniards at the time of the conquest, to believe that at some very remote period Christianity had been preached in the newly-found continent. Some learned Mexicans thought they discovered the apostle St Thomas, in the mysterious personage, high-priest of Tula, whom the Cholulans knew under the name of Quetzalcoatl. There is no doubt that the doctrines of the Nestorians, mixed with the opinions of the Buddhists and the Chamans, found their way through Mantchou Tartary into the north-east of Asia. It is possible, therefore, to suppose with some appearance of reason, that ideas connected with Christianity may have been communicated by the same road to the Mexican races, and particularly to the inhabitants of that northern region from which the Tolteques migrated.

SINGULAR STORY OF EDWARD GUNN.

Some time about the middle of last century, there flourished in Edinburgh a respectable tailor, whose name for the present shall be Gunn. This individual, at his decease, left a family, of which the most remarkable member was a son named Edward, who at an early age showed an uncommon taste for drawing and painting, and who was accordingly educated with a view to his following out that art as a profession.

In the year 1788, there occurred one of those midnight brawls so common at the time, which, however, was attended with very unpleasant consequences, unnecessary to be here particularised. The affair had assumed so serious an aspect, that several young men of respectable connections found it necessary to go into retirement for a season. Mr Edward Gunn was then a wild, roving blade; but whether he had any share in the riotous proceedings alluded to, was not exactly ascertained. Be this, however, as it may, the fact is certain, that he shortly afterwards took his departure for London, accompanied by a twin-sister, to whom he bore a striking resemblance. Here he remained in obscurity for several years, at the end of which period it was given out that he was dead, and that his sister was about to return to her native city. Accordingly, the supposed young lady (who was no other than Mr Edward himself in disguise) made her appearance; and, what may appear hardly credible, notwithstanding the disadvantages of a very masculine voice, and a beard which was by no means equivocal, he succeeded not only in imposing upon the public in general, but even upon his guardian, who never knew of the deception up to the day of his death. By this gentleman's influence, the soi-disant Miss Gunn succeeded in establishing a most respectable drawing and painting academy for young ladies. Such were the talents and assiduity of the teacher, that her school soon rose into celebrity, and continued for at least twenty years the most prosperous establishment of the kind in Edinburgh; in addition to which, she attended all the principal female boarding-schools, to give instructions in that branch of education.

As the analogy which subsists between poets and painters is sufficiently known, it will not appear surprising that Miss Gunn should have essayed her talents in rhyme; and, accordingly, at the period of the threatened French invasion, she published a poem, entitled, "Compliments to Painters," in which she indulged in some pretty free remarks upon her brethren of the brush, and against whose anticipated malice she invoked the protection of the Edinburgh volunteers, who were then in great vogue, in lines commencing thus:—

> "Guard and protect me, all ye volunteers,
> Brave Scotia's champions, matchless cavaliers!"

The success which attended her drawing establishment might have enabled her to realise a very competent fortune, had it not been that latterly she fell into very dissipated habits, which soon occasioned a gradual falling off in her school, and ultimately reduced her to extreme poverty. After undergoing all the vicissitudes of hardship and privation, she was at length necessitated to take refuge in the charity workhouse, where she had remained only a short time, when the notable discovery was made, that the supposed female belonged to the opposite sex. This circumstance having been reported to the managers, and it being proved, besides, that she was an incorrigible drunkard, she was forthwith expelled from that establishment. Thus was she again thrown upon her own resources; and having resumed the male attire, which she had laid aside for *full thirty years*, she (or rather we must now say *he*) had recourse to his old profession, and contrived for a time to pick up a precarious livelihood. What was his ultimate fate, the writer of this is unable to state; but during a temporary gleam of prosperity, Mr Gunn married a young woman, about twelve years ago, by whom he had several children—upon one occasion twins. The person who communicates this narrative, about twenty years ago received lessons in drawing from him when in the female disguise, and has frequently seen him latterly in male attire. As to whether the male or female habit became him most, the opinion of the landlady with whom he resided some time previous to his marriage may be taken:—"Weel-a-wat," she used to say, "he was an unco thief-like limmer of a woman; but troth, he's a weel-faured wiselike chield, now that he's a man."

BIOGRAPHIC SKETCHES.

HUMBOLDT, *concluded.*

In January 1803, our travellers took their departure for Guayaquil, in the vicinity of which they found a magnificent forest of palms, and other trees, which here vegetate in indescribable luxuriance. From this place they proceeded by sea to Acapulco, in New Spain. It was Humboldt's intention only to make a few months' stay in Mexico, and return with all possible speed to Europe. But, amongst other circumstances, the attractions of so beautiful and diversified a country determined him to remain until the middle of winter. After making various philosophical observations and experiments, our travellers set out in the direction of Mexico. They passed through the burning vallies of Mescala and Papagayo, where the thermometer stood in the shade at 104° of Fahrenheit, traversed the elevated plains of Chilpauzlugo, Theuilotopec, and Tasco, where oaks, cypresses, fir-trees, and European grain, flourished in a mild climate. After visiting the silver mines of Tasco, the oldest, and formerly the richest, in Mexico, they reached the capital, which is very pleasantly situated, and is distinguished from all the cities of the New World by its scientific institutions. After a residence of some months, during which Humboldt corrected the longitude of Mexico, our travellers visited the celebrated mines of Moran and Real del Monte, and examined the obsidious Oyamel, which lie embedded in the layers of pearlstone and porphyry, and served the former inhabitants for knives. The basaltic columns are as remarkable for their regularity as those of Staffa: some are horizontal, and others have various degrees of inclination, but they are for the most part perpendicular. After visiting other parts of the kingdom, they set out for Guanaxuato, a large city, placed in a narrow defile, and celebrated for its mines. They were here occupied for two months with measurements and geological investigations, examined the baths of Comagillos, whose temperature is about 25° of Fahrenheit higher than that of those in the Philippine Islands, and then traversed the valley of St Jago to Valladolid, the capital of the former kingdom of Mecoacan. Notwithstanding the continuance of the heavy autumnal rains, they descended by Patzquaro, which is situated on the edge of an extensive lake towards the shores of the Pacific Ocean, to the plains of Jorullo. Here they entered the great crater, making their way over crevices exhaling ignited sulphuretted hydrogen, and experiencing much danger from the brittleness of the lava. The formation of this volcano is one of the most extraordinary phenomena which have been observed in nature. The plain of Malpais, covered with small cones from six to ten feet high, is part of an elevated table-land, bounded by hills of volcanic and other rocks. From the time of Columbus's discovery till 1759, the surface of the country had experienced no remarkable vicissitude. In June of the above year, however, hollow sounds were heard to issue from the earth, and these were followed by a series of earthquakes which continued for two months. From the beginning of September, every thing seemed to announce the re-establishment of tranquillity; but on the night of the 28th, the subterranean thunder again began to peal in the ears of the affrighted inhabitants, who fled for refuge to the neighbouring mountains. A tract not less than from three to four square miles rose up in the shape of a dome; and flames were also said to issue from a space of above six square miles, while fragments of red-hot rocks were hurled to an immense height, and the earth, convulsed far and wide, reeled like a sinking ship. Thousands of the small cones noticed above suddenly appeared; and in the midst of them six great masses, called hornitos or ovens, sprung up from a gulf. The most elevated of these, which is about 1640 feet above the original level of the plain, is the great volcano of Jorullo, which burns continually. At the time when Humboldt visited this place, he was informed by the natives that the heat of these ovens had formerly been much greater. The thermometer rose to 203° when placed in the fissures exhaling aqueous vapour. All the cones emitted a dense smoke, and from some of them subterranean sounds were heard to issue. The Indians of this province are represented as being the most industrious of New Spain. They have considerable talent for cutting out images in wood, and dressing them in clothes made of the pith of an aquatic plant, which, being very porous, imbibes the most vivid colours. At Tolucca, our travellers visited the wonderful hand-tree, the *cheiran-thostæmon* of Cervantes, of which at one time there was supposed to exist but a single specimen. After their arrival at Mexico, they spent some time in arranging their botanical and geological collections, and in making philosophical observations. In January 1804, they quitted Mexico, with the intention of examining the eastern declivity of the Cordillera of New Spain. They also measured the great pyramid of Cholula, an extraordinary monument of the Tolteck race. It is composed of bricks, apparently sun-dried, alternating with layers of clay. Our travellers now descended to the port of Vera Cruz, where they embarked for Havannah, from whence they went to Philadelphia, spending here and at Washington two months, and then set sail for Europe.

The results of this expedition, conducted with so much talent and zeal, have been of the very highest importance. Previous to Humboldt's visit to New Spain, our information regarding that interesting and extensive territory was meagre and inaccurate. From various causes, none of the least of which was the narrow policy of the government there established, it lay for centuries in dim obscurity of "darkness visible," which the eye of research was unable to penetrate. The maps were very inaccurate, and even the latitude and longitude of the capital remained unfixed. This gave rise to a curious circumstance: A total eclipse of the sun took place on the 21st of February 1803, and threw the inhabitants into a state of great consternation; for the almanacks, calculating from a false indication of the meridian, had, in predicting the event, announced that it would be scarcely visible. To Humboldt belongs the honour of having dispelled in some measure the darkness in which we remained regarding that country. It would be impossible almost to give an idea of the vast mass of intelligence contained in his great work upon the subject. Never traveller returned to his native land so richly fraught with all that could interest and instruct. With respect to natural history, the information already laid before the public eye, obtained from the observation of six years, exceeds any thing that had been presented by the most successful cultivators of the same field during a whole lifetime. The rich collections which the travellers brought with them are unique in their kinds, and of inestimable value. They contain, amongst other things, 6300 kinds of plants. The account of their travels was published by Humboldt in the splendid work which appeared at Paris, Hamburgh, and London, in 1810 and following years. The whole series, which consists of twelve volumes quarto, and three volumes folio, with two collections of maps and one of picturesque engravings, has been justly called, by a competent judge, "a work of gigantic extent and richness, to which the modern literature of Europe can hardly offer a parallel." The first division is devoted to general physics, and to an account of their journey. The first part of this account is contained in the numbers already published, under the separate title of "Vues des Cordilléres et Monumens des Peuples de l'Amerique," and is adorned with about sixty engravings: the second division relates to zoology and comparative anatomy: the third contains a political essay on New Spain: the fourth is devoted to astronomy: the fifth to mineralogy and magnetism: and the sixth to botany.

The labour required for reducing the observations of our travellers to a state fit for the public eye, must have been very great. The mind of Humboldt, however, is as much characterised by its activity as by the vastness of its acquirements. He engaged himself besides in various investigations, part of which were published in the foreign journals. In concert with M. Gay Lussac, with whom he lived in the most intimate friendship, he has made numerous magnetic experiments, and verified Biot's theory respecting the position of the magnetic equator. They have found that the great mountain chains, and even the active volcanos, have no appreciable influence on magnetic power, and have established the fact that it gradually diminishes as we recede from the equator. On the return of the philosophers from America, Bonpland was appointed by Bonaparte to the office of superintending the gardens at Malmaison, where the Empress Josephine had formed a splendid collection of exotics. In 1818, he went to Buenos Ayres, as professor of natural history. In 1820, he made an excursion into the interior of Paraguay; but when he arrived at St Anne, on the eastern bank of the Parana, where he had established a colony of Indians, he was unexpectedly surrounded by a large body of soldiers, who destroyed the plantation, and carried him off a prisoner. He was confined chiefly in Santa Martha, but was allowed to practise as a physician. Humboldt applied in vain for the liberty of his friend, for whom he cherished a sincere affection. According to a late report, he has obtained his liberty. In October 1818, Humboldt visited London, where it is said the allied powers requested him to sketch a plan of the political situation of the South American people. For the execution of his plan to undertake a scientific journey to the East Indies and Thibet, the king of Prussia, at Aix-la-Chapelle, in November 1818, granted him a yearly pension of 12,000 dollars, and the use of the necessary instruments. But this journey was abandoned. Humboldt lived many years in Paris, devoted to the sciences, till, in the winter of 1822, he was called to accompany the king of Prussia on his journey through Italy. His residence at Naples was the cause of his inquiries into the formation of volcanos, the result of which he gave to the public in a small essay. In the latter part of 1826, he returned from Paris to Berlin. In 1827, he made a journey to Northern Asia, as far as the confines of China, in which he was much assisted by the Russian government, which wished to obtain, through him, more correct information respecting the character and contents of the Ural Mountains.

No regular narrative of this journey has yet been published, but the following outline of it we have obtained from an able work by Mr Macgillivray, entitled, "Travels and Researches of Baron Humboldt," which is an abstract of a French work entitled "Fragments of Asiatic Geology and Clemitology, par A. de Humboldt."

Our traveller, accompanied by MM. Ehrenberg and Gustavus Rose, embarked at Nignei-Novgorod, on the Volga, and descended to Kasan and the Tartar ruins of Bolgari; from thence he went by Perm to Jekatherinenburg, on the Asiatic side of the Uralian Mountains—a vast chain, comprising several ranges which run nearly parallel to each other. The highest summits scarcely attain an elevation of 4000 or 5000 feet, but, like the Andes, they follow the direction of a meridian from the neighbourhood of Lake Aral to the vicinity of the Frozen Sea. A month was spent in investigating the central and northern parts of these mountains, malachite mines of Goumescherskoi, the great magnetic ridge of Blagodad, and the celebrated deposits of Mourzinsk, in which topaz and beryl are found. Near Nignei-Tagilsk (a country which has been compared to Choco in South America, in respect of its character and productions), a mass of platina (the heaviest, most durable, and in many respects the most valuable of the metals, not excepting gold), weighing about 21½ lbs. troy, has been found. From Jekatherinenburg the travellers went by Tioumen to Tobolsk on the Jotisch, and from thence by Tara (a desert of Baraba, which is dreaded on account of the torments caused by the multitudes of insects) to Barnaoul on the banks of the Ob, the picturesque lake of Kolyvan, and the rich silver mines of Schlangenberg, Riddersk, and Zyrianovski, situated on the south-western declivity of the Altaic range. They proceeded southward from Riddersk to Oust-Kamenogorsk, and passed through Boukhtarminsk to the frontier of Chinese Zungaria. They even obtained permission to cross the frontier, in order to visit the Mongol post of Bates, or Khonimailakhou, northward of the lake Dzaisang, and returned to Oust-Kamenogorsk. From this place they went along the steppe of the Middle Horde of the Kirghiz, by Semipolatinsk and Ouish, and the lines of the Ichim Cossacks and Tobol, to reach the southern part of the Ural, where, in the vicinity of Miask, in a deposit of very small extent, and at a few inches depth, were found three masses of native gold, one of which weighed about 18, and the other above 28 lbs. troy. They next proceeded along the Southern Ural, to the fine quarries of green jasper at Orsk, where the river Jaik crosses the chain from east to west. From thence they passed by Souberlinsk to Orenburg, which is below the level of the sea, and then visited the famous salt-mine of Ilétzki, situated in the steppe of the Little Kirghiz Horde. They afterwards inspected the principal place of Ouralsk Cossacks; the German colonies of the Saralow government, on the left bank of the Volga; the great salt-lake of Eldon, in the steppe of the Kalmucks; and a fine colony of Moravians at Sarepta; and, finally, arrived at Astracan. The principal objects of this excursion to the Caspian Sea were the chemical analysis of its waters, which Mr Rose intended to make; the observations of the barometrical heights; and the collection of fishes, for the great work of Baron Cuvier and M. Valenciennes. From Astracan the travellers returned to Moscow by the isthmus which separates the Don and the Volga, near Tichanskayu and the country of the Don Cossacks. In the course of seven weeks, Humboldt had passed over the frontiers of Chinese Zungaria, between the forts of Oust-Kamenogorsk and Boukhtarminsk, and Khonimailakhou (a Chinese post to the north of the lake Dzaijang), the Cossack line of the Kirghiz steppe, and the shores of the Caspian Sea. In the important commercial towns of Semipolatinsk, Petropalauska, Troitzkaia, Orenburg, and Astracan, he obtained from the Tartars, Bucharians, and Tachkendis, information respecting the Asiatic regions in the vicinity of their native country. At Orenburg, where caravans of several thousand camels annually arrive, an enlightened individual, M. de Gens, has collected a mass of materials of the highest importance for the geography of Central Asia. It is understood that this illustrious traveller is now engaged in the preparation of these his journeyings into the Asiatic Continent.

A TURKISH SKETCH.

The Mahomedans generally, and the Turks in particular, are a people who place a great deal of blind dependence on Fate, or Providence. Instead of *using the means* to effect a special purpose, they will sit down in apathy, and believe that God will do all that is required for them. This species of folly is well illustrated in the story of "Anastasius," a work which will hardly have been perused by many of our readers. The incident is thus related:—

"I possessed not that even temperature of mind which steers clear of extremes: I could never do any thing in moderation. My soul fired at the recent instances I had witnessed in Mavrocordato and others, of immense fortunes made in trade; and, already in love with wealth on its own account, I doubly reverenced it in view of the power obtainable through its influence: for ambition would never leave me entirely quiet, but, when it was turned out of doors, stole in at the window, and added its persuasions to the other motives which had determined me before to become a first-rate merchant. So fast galloped my imagination, that already I saw myself standing with one leg in Cashmere, and with the other in St Domingo; with the right hand loading hemp at St Petersburg, and with the left gold and negroes on the Guinea coast; and covering with my vessels at once the Atlantic and the Mediterranean, the Euxine and the South Sea. I had genius; I could, if I chose, force perseverance; and the only trifles wanted were capital, credit, and correspondents.

Providence had just kept in store for me the only person ready to hold all these desiderata at my disposal on the shortest notice. I found every thing needful in an old Moslemin, grown enormously rich through nothing but his undeviating perseverance to do all that, by common calculation, ought to have reduced him to beggary. In the true spirit of predestination, Welid maintained that no mode of conduct begot ill-luck so infallibly as caution. 'It manifested mistrust,' he said, 'in the ways of Providence; and one single pious ejaculation at the outset of an enterprise was worth all the calculations of worldly wisdom.' Indeed, Welid might quote his whole life in proof of this doctrine.

But, to go no farther back in the recapitulation than the instances of the last twelvemonth:—The Porte had sent away for riotous behaviour the Sclavonians who do the garden work about Constantinople, just at that period of the spring when the setting fruits require constant irrigation. All Welid's neighbours strained every nerve to supply the deficiency, while Welid alone saw the pining of his oranges, his citrons, and his pumpkins, with perfect apathy, and only exclaimed, 'God is great!' What was the consequence?—The sky, usually of brass in that season, all at once opened its sluices, and made Welid's garden, on the very brink of annihilation, yield a double crop.

Again: the unusual rains, in the hottest month of the year, had produced a dreadful plague. Most of Welid's friends took some precautions against the infection, while Welid alone seemed by preference to go where the malady was rifest, and only repeated, 'God is great!' What ensued?—Not a finger of Welid's ached all the time; but he became heir to every one of his relations who had evinced more prudence.

And again: the dampness of the summer was followed by an autumn so dry, that every night saw Constantinople disturbed by some dreadful conflagration. Several of Welid's acquaintance therefore watched their premises, while Welid heard the cry of fire in his very yard, without saying any thing but 'God is great!' How did the business end?—Welid's house indeed was burnt to the ground: but the falling walls discovered a deposit of gold and jewels sufficient to build a score of palaces.

What, therefore, could be more natural than for Welid to infer, that the more imprudences he committed, the less he could fail to prosper? Nor did he lack examples of the mischiefs arising from a more wary conduct; for—not to mention his own brother, who, with a sincere and heartfelt wish for wealth, had, from the mere apprehension of making a bad hit, never made a good one; nor his nephew, who, grudging a servant's wages, had, in his loneliness, been murdered by a band of robbers; nor his cousin, who, to save his old vessel a scouring, had sold his gold for brass—what but Emin's resorting to medicine in a malady from which he might have recovered, had made him take a deadly poison? What but Talib's fear of a pursuing foe had caused him to fall into a torrent, and be drowned? And what but Nasser's inventing a most ingenious trap for thieves, had kept him confined by the leg in his own fetters, until he died of hunger amidst all his dearly purchased treasure?

The vast fortune which Welid had by his imprudence acquired, I advised him to employ in some grand speculation, and to make me his partner in the concern. Others might not have thought me the fittest person for a commercial associate, but I repeated 'God is great!' until Welid committed all his affairs to my management. We went, he, his son, and myself, to Smyrna; there freighted a vessel with cotton, and resolved to carry our merchandise to Marseilles, where we could not fail to find a good market. As I contributed but little toward the purchase, my portion was to be but small in the profits: this, however, remained a tacit clause between us, too well understood to be expressed. No regular account, no legal vouchers, no written memorandum whatever, was drawn up of our respective shares. Welid was not a man to trouble himself about such formalities. 'Each knew his own,' he said, 'and that was enough.'

In one respect, however, he showed an invincible obstinacy. He had taken it into his head that it would be manifesting his trust in Providence to hire the first vessel he should meet with. This happened to be precisely the oldest and craziest concern in the harbour—a thing on the eve of being broken up as unfit for service. The circumstance, however, so far from deterring, only confirmed Welid in his purpose. He thought it a most fortunate opportunity of signalising his reliance on heaven, and no entreaty or remonstrance could make him desist from freighting this miserable wreck, in preference to a dozen stout vessels disengaged. He would not even insure. It was flying in the face of Providence, and almost as bad as atheism or blasphemy; so that, unable to persuade my partner, I had insurance made in my own name on the whole cargo.

We now set sail. Hardly had we got into the latitude of Chio, when Welid's son—as hale a boy to all appearance as ever was seen—suddenly fell ill, and died. Our crew, chiefly Provençals, doubted not his being a victim to the plague, which had begun to spread in Smyrna, and became almost petrified with terror. Welid himself, though he had appeared fond of his child while alive, shed not a tear on his death, bore his loss with his inherent apathy, and only as usual exclaimed 'God is great!' I felt so angry with him for his insensibility, that I almost longed to see him go to the shades after his boy.

The sailors only wondered that so infirm an old man as Welid—after having sat open-mouthed, as it were, to inhale the contagion which had felled a robust youth—should still continue to breathe, but did nothing to get rid of him, and suffered him to live on unmolested. It is true that scarcely had his son breathed his last, than there arose a storm, of which the very first blast shivered our bark to splinters. It sent twelve fine young sailors and their captain to the bottom, but kindly spared Welid and me; and as the cargo was now lost at all events, I determined to atone for whatever evil thoughts might, without my leave, have risen in my breast, by doing my utmost to save my partner. I lugged him after me on a floating hencoop; and, as it had not required an out of the way rough sea to make an end of our crazy skiff, this vehicle supported its load, until the wind and current carried us ashore on the neighbouring coast of Samos.

Welid, who had only suffered himself to be saved, like one of his bales of cotton or bags of corn, without making a positive resistance, experienced on this rather trying occasion so little extraordinary wear and tear of body or mind, that, weak and old as he was, he still brought ashore strength enough to cry out with great satisfaction on the loss of his cargo, as he had done on that of his child, 'God is great!'—while I, on whom had fallen all the weight of exertion, could scarce articulate from exhaustion.

Our shipwreck close to the land in broad daylight had collected round us a number of fishermen, all impressed with becoming gratitude towards Providence, not so much for having spared our lives, as for having destroyed our vessel on their shore. Too late, however, to push our persons back into the waves from which we had just emerged, they exerted themselves the other way, and helped us on, lest we should witness their proceedings in regard to the wreck. The little money we had in our pockets was employed in getting ourselves conveyed, as soon as the storm subsided, to Kooshadasi on the mainland of Anadoly; but this short voyage completely exhausted our finances, and on our arrival we had not a para left.

Nor were we, for the present, in want of a para. The Turk, where bigotry interferes not with his better feelings, is as charitable as he is confiding. He neither attributes good fortune entirely to man's own sagacity, nor ill-luck solely to his imprudence, and neither is apt to listen with suspicion to the tale of the indigent, nor to cast blame on the conduct of the unfortunate. Looking upon adversity as proceeding from the same high source from whence flows prosperity—feeling as little degraded by the pressure of God's hand upon him, as elated by its support—he confers charity without pride, as he asks it without meanness. We, therefore, who came as supplicants, in need of every thing, found every thing we needed. Every inhabitant vied with the rest in supplying our necessities, and providing for our comforts. Hence Welid, who wanted repose, resolved to avail himself for a few days of the hospitality so handsomely tendered; while I only requested a horse and a guide, to take me on to Smyrna. The two animals soon were found, and I set off.

My first care, on arriving at this place, was to recover the insurance on the shipwrecked cargo. After some delay, occasioned by legal inquiries, affidavits, &c., I got indemnified for every bale of cotton put on board. Welid, who in the meantime had also reappeared, declined to share in the recovery, as he had refused to join in the insurance. It was only by stratagem I could make him accept a small part of the produce. No way cured, however, by his loss, of his blind confidence in his destiny, he continued to commit fresh imprudences, until, from the condition of a wealthy merchant, he became reduced to that of a poor basket-maker; but whenever we met, he still would lay aside his osier twigs to point to heaven, and to cry out, 'God is great!'"

A CHAPTER FOR THE WORKING CLASSES.

There is hardly any thing more odious in our great manufacturing and trading system, than combinations, whether of masters or workmen. Combinations are neither more nor less than conspiracies to secure private and unnatural advantages at the expense of the public, and in their character are essentially opposed to those generous and really profitable principles of free trade which all sound-thinking men are now ready to advocate, and which at least the working classes have been long strenuous in insisting upon as necessary for their welfare. We hold it as an imperishable maxim in our general economy, that every thing vicious will sooner or later find its level. Truth

and justice will survive, though all mankind were to combine to extirpate them. It is one of the imprescriptive just rights of man, that he is entitled to make the most of his labour. He ought to be at liberty to roam over the whole earth to seek out employment suited to his abilities or his taste; in the same degree so should the master be entitled to get his work done where and how he chooses. Both have equal rights and privileges to be respected. And it will be found in the long-run that this species of liberty is the most profitable, as well as the most comfortable for all parties. Combinations to restrict such a freedom, as being adverse to the great principles which secure the rights of individuals, may appear to be advantageous for a while, but they cannot exist beyond a brief period of time. They are founded on a fallacy. The present generation may encourage them; but the next, if more intelligent, which it is likely to be, will look upon them as simply resulting from that species of ignorance which in the dark ages of our history invested bodies of men with the injurious privileges of trading incorporations, and conspired against the welfare of the community.

Mr Babbage, in his admirable work on Machinery and Manufactures, thus illustrates the subject of combinations:—"The effects arising from combinations amongst the workmen, are almost always injurious to the parties themselves. There are numerous instances in which the public suffer by increased price at the moment, but are ultimately gainers from the permanent reduction which results; whilst, on the other hand, the improvements which are often made in machinery in consequence of 'a strike' amongst the workmen, most frequently do an injury, of greater or less duration, to that particular class which gave rise to them. As the injury to the men and to their families is almost always greater than that which affects their employers, it is of the utmost importance to the comfort and happiness of the former class, that sound views should be entertained by them upon this question. For this purpose a few illustrations of the principle which is here maintained, will probably have greater weight than any reasoning of a more general nature, though drawn from admitted principles of political economy. Such instances will, moreover, present the additional advantage of appealing to facts known to many individuals of those classes for whose benefit these reflections are intended.

There is a process in the manufacture of gun-barrels for making what, in the language of the trade, are called *skelps*. The *skelp* is a piece or bar of iron, about three feet long, and four inches wide, but thicker and broader at one end than at the other: and the barrel of a musket is formed by forging out such pieces to the proper dimensions, and then folding or bending them round into a cylindrical form, until the edges overlap, so that they can be welded together.

About twenty years ago, the workmen employed at a very extensive factory in forging these skelps out of bar-iron, 'struck' for an advance of wages, and as their demands were very exorbitant, they were not immediately complied with. In the meantime, the superintendant of the establishment directed his attention to the subject; and it occurred to him, that, if the circumference of the rollers, between which the bar-iron was rolled, were to be made equal to the length of a *skelp*, or of a musket-barrel, and if also the grooves in which the iron was compressed, instead of being equally deep and wide, were cut gradually deeper and wider from a point in the rollers, until it returned to the same point, then the bar-iron passing between such rollers, instead of being uniform in width and thickness, would have the form of a *skelp*. On making the trial, it was found to succeed perfectly, a great reduction of human labour was effected by the process, and the workmen, who had acquired peculiar skill in performing it, ceased to derive any advantage from their dexterity.

It is somewhat singular that another and a still more remarkable instance of the effect of combination amongst workmen should have occurred but a few years since in the very same trade. The process of welding the 'skelps,' so as to convert them into gun-barrels, required much skill, and after the termination of the war, the demand for muskets having greatly diminished, the number of persons employed in that line was very much reduced. This circumstance rendered combination more easy; and upon one occasion, when a contract had been entered into for a considerable supply to be delivered on a fixed day, the men all struck for such an advance of wages as would have caused the completion of the contract to be attended with a very heavy loss. In this difficulty, the contractors resorted to a mode of welding the gun-barrel, according to a plan for which a patent had been taken out by them some years before this event. It had not then succeeded so well as to come into general use in consequence of the cheapness of the usual mode of welding by hand-labour, combined with some other difficulties with which the patentee had had to contend. But the stimulus produced by the combination of the workmen for this advance of wages, induced him to make new trials, and he was enabled to introduce such a facility in welding gun-barrels by rollers, and such perfection in the work itself, that, in all probability, very few will in future be welded by hand-labour.

The process consisted in turning a bar of iron, about a foot long, into the form of a cylinder, with the edges a little overlapping. It was then placed in a furnace, raised to a welding heat, and taken out, when a triblet, or cylinder of iron, being placed in it, it was passed quickly through a pair of rollers. The effect of this was, that the welding was performed at a single heating, and the remainder of the elongation necessary for bringing it to the length of the musket-barrel, was performed in a similar manner, but at a lower temperature. The workmen who had combined were of course no longer wanted, and instead of benefiting themselves by their combination, they were reduced permanently, by this improvement in the art, to a considerably lower rate of wages: for as the process to which they had been habituated required peculiar skill and considerable experience, they had hitherto been in the habit of earning much higher wages than other workmen of their class. On the other hand, the new method of welding was far less injurious to the texture of the iron, which was now exposed only once, instead of three or four times, to the welding heat, so that the public derived advantage from the superiority, as well as from the economy of the process. Another advantage has also arisen from its introduction; for the new process is now applied to the manufacture of iron tubes, which can thus be made at a price which renders their employment very general. They are now to be found in the shops of all our larger ironmongers, in various lengths, and of different diameters, with screws cut at each end, and are in constant use for the conveyance of gas for lighting, or of water for warming our houses.

Similar examples must have presented themselves to those who are familiar with the details of our manufactories, but these are sufficient to illustrate one of the results of combinations."

BRISSON'S CAPTIVITY IN AFRICA.

Shipwreck on the coast of Africa, particularly on the western coast, has been always attended with peculiar circumstances of horror and distress. The unhappy sufferers, on escaping from the raging billows of the ocean, find themselves exposed to unmitigated misery, on a barren and inhospitable coast, abounding not only with wild beasts and noxious reptiles, but also inhabited by men of a most barbarous disposition, exceeding in ferocity even the savage animals of the desert themselves. The country of Morocco, which extends about 600 miles along the shores of the north-western part of Africa, is possessed by a race of men who are characterised as being jealous, deceitful, superstitious, and cruel to a most excessive degree; so that any mariners who have had the misfortune to be wrecked on these coasts, have almost invariably met with immediate death from their hands, or have been condemned to suffer the miseries of a most wretched and hopeless captivity amongst them. There are two sorts of inhabitants in Morocco—the Arabs, who dwell in moveable villages, composed generally of about 100 tents each; and the Berebbers, Barbars, or aborigines, who live in towns and villages. There are also a great number of Christian slaves, and some merchants on the coast, besides a multitude of Jews, who carry on almost all the trade, especially by land, with the negroes, to whom they send large caravans, which travel over vast deserts almost destitute of water. The inhabitants of these western parts of Africa have, therefore, been long a various and mingled race, and, along with the other nations on the African coast as far as the borders of Egypt, are known to Europeans by the general denomination of *Moors*.

On the open plains of Morocco the climate is torrid, yet genial. Its grand chain of mountains, denominated Atlas, from whence the neighbouring ocean has received the name of the *Atlantic*, has its summits often covered with snows; and between these and its bases, there is presented almost every diversity of climate and temperature. Excessive rains sometimes deluge the level districts, to the destruction both of vegetables and animals; there is sometimes a drought, which continues till vegetation is almost wholly withered; and armies of locusts occasionally devour the produce of the most fruitful seasons, before it can be converted to the use of man. Sheep and oxen are the most plentiful among the domesticated animals in these countries; the camel is the common beast of burden; the horse and the mule are employed for riding: fowls, pigeons, and partridges, hares, and, in the northern parts, rabbits, are in sufficient abundance. The wild animals of the forests and mountains, are, deer of different sorts, antelopes, foxes, bears, lions, and tigers.

Monsieur Brisson's account of his shipwreck on these barbarous coasts, attended with all its usual horrors, and of a most distressful captivity in consequence of it, among the savage inhabitants, is possessed of great interest and importance. The interest is almost equal to that which is excited in reading Byron's Narrative; and a great similarity exists between his sufferings and those of Monsieur Brisson, from whose narrative we shall now select a few of the most interesting particulars.

His voyages to Africa, the author says, had already been productive of many hardships and much loss to him, when he received an order from the French government, in the month of June 1785, to embark for the island of St Louis, at Senegal. When he arrived at the Canaries, the vessel on which he was aboard passed between these isles and that of Palma; but the captain, having refused to follow M. Brisson's advice, the ship was soon after driven upon the coast, and cast away. In many particulars, it will be observed that this catastrophe is remarkably similar to that of the Medusa in later times. Immediately after this fatal occurrence, he asked the captain at what distance they might be from Senegal; but the answer he received not proving satisfactory, he informed his companions in misfortune, that he could not flatter them with the hope of being able to conduct them to any village of the tribe of Trargea, where he might perhaps have been known to some Arab, who had relations at the island of St Louis, in which case their captivity would have been shorter and less rigorous. "I am afraid," added he, "of meeting with some hordes of the tribe of Ouadelims and the Labdesseba, a ferocious people, who live like real savages, who always wander through the deserts, and who feed on the milk of their camels."

According to M. Brisson's conjecture, they fell immediately into the hands of the Labdesseba, and these barbarians, after plundering the ship, stripped him and his companions, and then crowded them into a small hut, covered with moss, which was above a league distant from the sea. As M. Brisson's master happened to be a *talbe*—for so these savages name their priests—he thought he should procure some alleviation of his misfortunes, by bestowing upon him the few jewels he had in his possession; namely, two watches with their chains, a ring set with diamonds, and two hundred livres in specie. The *talbe* hereupon made him great promises, but he soon proved to be as deceitful as he was barbarous. To avoid another tribe still more savage, the Arabs made their prisoners proceed, by forced marches, to the interior parts of the country, during which they were so oppressed with thirst, that they could scarcely move their tongues. In this situation they obliged them to climb mountains of a prodigious height, and covered with sharp flints, by which their feet were dreadfully cut and mangled. Their masters made a kind of paste of barley meal, which they mixed with water in the hollow of their hands, and swallowed without chewing it.

"As for us slaves," says M. Brisson, "we had nothing to eat but the same kind of paste. The Arabs threw it to us upon a kind of carpet, which our patron generally spread below his feet when he repeated his prayers, and which he used as a mattress during the night; after having kneaded this leaven a long time, he gave it to me, that I might divide it among my companions. One can hardly conceive how disagreeable this leaven was to the taste. The water with which it was mixed had been procured upon the sea-shore, and had been preserved afterwards in the skin of a goat newly killed. To prevent it from corrupting, they had mixed a kind of pitch with it, which rendered the smell of it doubly nauseous. The same kind of water was given us to drink, and, bad as it was, our allowance of it was extremely small."

Next morning, after a most laborious march over a plain, upon which the rays of the sun fell almost perpendicularly, the prisoners were employed in unloading the camels, and in pulling up roots; a labour which was exceedingly painful, as in that country the root and herbs are mixed with briars and thorns. When the sand was well heated by the fire, the Arabs covered a goat with it, until it was completely baked; and immediately, without giving themselves time to free it from the sand which adhered to it, they devoured it with incredible voracity. After having thoroughly gnawed the bones, they made use of their nails to scrape off the remaining flesh; after which, they threw them to their miserable slaves, bidding them eat quickly, and make haste to reload the camels, that their journey might not be retarded. At length, after a march of sixteen days, during which they were exposed to the greatest hardships and fatigue, they arrived in a most deplorable and extenuated condition, at the habitation of their masters. The reception which they met with from the women was mortifying in the utmost degree. When they had satisfied the first emotions of their curiosity by looking at them for some time, they bestowed the most abusive language upon them, spit in their faces, and even pelted them with stones. The children, copying their example, amused themselves by pinching them, pulling their hair, and scratching them with their nails. The heat was so excessive, that the flocks, half-starved, could find no pasture, and the sheep and goats returned with their dugs almost empty; and yet it was their milk, and that of the camels, which was to supply food for a numerous family. "One may judge after this," says M. Brisson, "how much our portion was diminished; as we were Christians,

the dogs even fared better, and it was in basins destined for their use that we received our allowance!"

Their situation became every day more wretched. The end of October was approaching, and a single drop of rain had not fallen for three years. The plains and vallies were entirely burnt up, and nothing remained for the nourishment of the cattle. The desolation was universal, when an Arab from a distant part of the country came to inform them that refreshing showers had covered those parts where he resided with abundance of vegetation. Joy then succeeded to fear and distress. Every one struck his tent, and all set out together. This was the thirtieth time they had changed their habitation, and that their fatigues had been renewed, for these hordes never remain above twelve or fifteen days in the same encampment. At length they arrived at the wished-for spot, where the sand was so impregnated with moisture, that the least pressure of the body made the water spout up in great abundance. Here the prisoners would have thought themselves very happy, could they have procured a hurdle made of osier twigs to repose upon, and a coarse-napped carpet of wool to cover them; but amongst the Arabs none but those who are rich use such pieces of furniture. To add to their misfortunes, their portion of food was increased, but only with water, so that in a little time they had nothing to eat but water whitened with meal, which weakened them to such a degree as can hardly be conceived. Wild plants and raw snails were then almost the whole of their aliment.

M. Brisson's master had promised to send him to Mogador, and to furnish him with the means of procuring his liberty; but he soon put an end to his dissimulation, and this unfortunate man lost every hope. He no longer met in the fields his miserable companions, and he regretted above all the loss of the captain. One evening he found him stretched out on the sand, and in such a condition that he scarcely knew him but by the colour of his body. In his mouth he held one of his hands, which only his extreme weakness prevented him from devouring. Hunger had so much changed his figure, that his appearance was horrid and disgusting. A few days after, the second captain, exhausted by want, fell down under a tree, where he remained exposed to the attacks of a monstrous serpent. Some hungry crows frightened the venomous reptile by their cries, and, perching upon the dying man, began to tear him to pieces; while four savage monsters, still more cruel than the furious snake, beheld this scene, and suffered the unhappy wretch to make vain efforts without deigning to lend him the least assistance. M. Brisson endeavoured to save him if possible, but he was prevented by the Arabs, who ill used and insulted him. Not knowing which way to bend his steps, he hastened away from this scene of horror.

Almost all the prisoners sunk under their misfortunes in succession, and no one was left to comfort Brisson under his sufferings; he became frantic through excess of thirst, and even the Arabs themselves died from the same cause. They preserved with the greatest care the water which they found in the stomachs of their camels, and boiled their flesh in it. At length his master's brother-in-law purchased him for five camels; and this man having occasion to go to the court of the emperor of Morocco upon business, he carried M. Brisson along with him. The French consul at that time was luckily in great favour with the emperor, on account of some presents which he had made him; for this reason the emperor set all the prisoners at liberty, and amongst the rest M. Brisson, who then found his way, once more, home to his native country.

ANECDOTES OF ANIMALS.

[From Jesse's Gleanings in Natural History.]

A SENTIMENTAL PIGEON.

A man, set to watch a field of peas which had been much preyed upon by pigeons, shot an old cock pigeon who had long been an inhabitant of the farm. His mate, around whom he had for many a year cooed, and nourished from his own crop, and assisted in rearing numerous young ones, immediately settled on the ground by his side, and showed her grief in the most expressive manner. The labourer took up the dead bird, and tied it to a short stake, thinking that it would frighten away the other depredators. In this situation, however, his partner did not forsake him, but continued, day after day, walking slowly round the stick. The kind-hearted wife of the bailiff of the farm at last heard of the circumstance, and immediately went to afford what relief she could to the poor bird. She told me that, on arriving at the spot, she found the hen bird much exhausted, and that she had made a circular beaten track round the dead pigeon, making now and then a little spring towards him. On the removal of the dead bird, the hen returned to the dove-cot.

INGENUITY OF BEES.

A large brown slug made its way into a glass hive, where the operations of the bees could be distinctly seen. Having killed the slug, and finding that they were unable to get it out of the hive, they covered it over with the thick resinous substance called propolis, and thus prevented its becoming a nuisance to the colony. Into the same hive, one of the common brown-shelled snails also gained admittance. Instead of embedding it in propolis, the bees contented themselves with fixing it to the bottom of the hive, by plastering the edge with that substance. I have now in my possession a regular fortification made of propolis, which one of my stocks of bees placed at the entrance of their hive, to enable them the better to protect themselves from the attacks of wasps. By means of this fortification, a few bees could effectually guard the entrance, by lessening the space of admission, which I had neglected to do for them.

INSTANCE OF SAGACITY IN A DOG.

He informed me that a friend of his, an officer in the forty-fourth regiment, who had occasion, when in Paris, to pass one of the bridges across the Seine, had his boots, which had been previously well polished, dirted by a poodle-dog rubbing against them. He in consequence went to a man who was stationed on the bridge, and had them cleaned. The same circumstance having occurred more than once, his curiosity was excited, and he watched the dog. He saw him roll himself in the mud of the river, and then watch for a person with well-polished boots, against which he contrived to rub himself. Finding that the shoeblack was the owner of the dog, he taxed him with the artifice; and after a little hesitation he confessed that he had taught the dog the trick, in order to procure customers for himself. The officer being much struck with the dog's sagacity, purchased him at a high price, and brought him to England. He kept him tied up in London some time, and then released him. The dog remained with him a day or two, and then made his escape. A fortnight afterwards he was found with his former master, pursuing his old trade of dirtying gentlemen's boots on the bridge.

A POODLE DOG.

A friend of mine had a poodle dog possessed of more than ordinary sagacity, but he was, however, under little command. In order to keep him in better order, my friend purchased a small whip, with which he corrected the dog once or twice during a walk. On his return, the whip was put on a table in the hall, and the next morning it was missing. It was soon afterwards found concealed in an outbuilding, and again made use of in correcting the dog. It was, however, again lost, but found hidden in another place. On watching the dog, who was suspected of being the culprit, he was seen to take the whip from the hall-table, and run away with it, in order again to hide it. The late James Cumming, Esq., was the owner of the dog, and related this anecdote to me.

PROPER PRIDE IN A DOG.

A gentleman, a good shot, lent a favourite old pointer to a friend, who had not much to accuse himself of in the slaughter of partridges, however much he might have frightened them. After ineffectually firing at some birds which the old pointer had found for him, the dog turned away in apparent disgust, went home, and never could be persuaded to accompany the same person afterwards.

THE ANTIPATHY OF THE HEN TO WATER

Is well known, yet the following is a curious instance of habit overcoming nature:—A hen, who had reared three broods of ducks in three successive years, became habituated to their taking to the water, and would fly to a large stone in the middle of the pond, and patiently and quietly watch her brood as they swam about it. The fourth year she hatched her own eggs; and finding that her chickens did not take to the water as the ducklings had done, she flew to the stone in the pond, and called them to her with the utmost eagerness. This recollection of the habits of her former charge, though it had taken place a year before, is not a little curious.

THE TREASURES OF THE DEEP.

What hid'st thou in thy treasure-caves and cells,
Thou hollow-sounding and mysterious main?—
Pale glistening pearls, and rainbow-colour'd shells,
Bright things which gleam unreck'd of, and in vain.
Keep, keep thy riches, melancholy Sea,
We ask not such from thee!

Yet more—the depths have more. What wealth untold
Far down, and shining through their stillness, lies!
Thou hast the starry gems, the burning gold,
Won from ten thousand royal argosies.
Sweep o'er thy spoils, thou wild and wrathful Main,
Earth claims not these again!

Yet more—the depths have more. Thy waves have roll'd
Above the cities of a world gone by.
Sand hath fill'd up the palaces of old—
Seaweed o'ergrown the halls of revelry.
Dash o'er them, Ocean, in thy scornful play,
Man yields them to decay!

Yet more—the billows and the depths have more
High hearts and brave are gather'd to thy breast—
They hear not now the booming waters roar—
The battle-thunders will not break their rest.
Keep thy red gold and gems, thou stormy grave—
Give back the true and brave!

Give back the lost and lovely—those for whom
The place was kept at board and hearth so long—
The prayer went up through midnight's breathless gloom,
And the vain yearning woke 'midst festal song.
Hold fast thy buried isles, thy towers o'erthrown—
But all is not thine own!

To thee the love of woman hath gone down—
Dark flow thy tides o'er manhood's noble head,
O'er youth's bright locks and beauty's flowery crown;
Yet must thou hear a voice—Restore the dead.
Earth shall reclaim her precious things from thee—
Restore the dead, thou Sea!

—*New Monthly Magazine.*

ENGLISH JOCKEYS.

THE present Samuel Chifney presents the beau ideal of a jockey; elegance of seat, perfection of hand, judgment of pace, all united, and power in his saddle beyond any man of his weight that ever yet sat on one. It is scarcely necessary to add, that he is son of the late celebrated jockey of his name, by the daughter of a training groom, consequently well bred for his profession, to which he is a first rate ornament. Such a rider as James Robinson may slip him, but no man can struggle with him at the end, and his efforts in his saddle, during the last few strides of his horse, are quite without example. There are, however, peculiarities in his riding. Excellent judge as he is of what his own horse and others are doing in a race, and in a crowded one too, he is averse to making running, sometimes even to a fault. Let whatever number of horses start, Chifney is almost certain to be amongst the last until towards the end of the race, when he creeps up to his brother jockeys in a manner peculiarly his own. But it is in the rush he makes at the finish that he is so pre-eminent, exhibiting, as we said before, powers unexampled by any one. His riding his own horse, Zinganee, for the Claret stakes (Craven meeting, 1829), was a fine specimen of his style, when contending against Buckle and James Robinson, and winning, to the astonishment of the field. In height, he is about five feet seven inches, rather tall for a jockey, and not a good waster. In fact, he is subject to much punishment to get to the Derby weight. Samuel does not ride often, but whenever he does, his horse rises in the market, as was the case with his father before him at one period of his life.

Some anecdotes are related of Chifney, confirming his great coolness in a race, and, among others, the following:—Observing a young jockey (a son of the celebrated Clift) making very much too free with his horse, he addressed him thus—"Where are you going, boy; stay with me, and you'll be second." The boy drew back his horse, and a fine race ensued; but when it came to a struggle, we need not say who won it. Chifney's method of finishing his race is the general theme of admiration on the turf. "Suppose," says he, "a man had been carrying a stone, too heavy to be pleasant, in one hand, would he not find much ease by shifting it into the other? Thus, after a jockey has been riding over his horse's fore-legs for a couple of miles, must it not be a great relief to him when he sits back in his saddle, and, as it were, divides the weight more equally? But caution is required," he adds, "to preserve a due equilibrium, so as not to disturb the action of a tired horse." Without doubt, this celebrated performer imbibed many excellent lessons from his father, but he is considered to be the most powerful jockey of the two.

James Robinson, also the son of a training groom, is a jockey of the highest celebrity, and, as far as the art of horsemanship extends, considered the SAFEST rider of a race of the present day. He may owe much of this celebrity to his having, when a boy, had the advantage of being in the stables of Mr Robson, the chief of the Newmarket trainers, and riding many of the trials of his extensive and prosperous studs. When we state that such a rider as Robinson is considered equal to the allowance of three pounds weight to his horse, we can account for his having been employed by the first sportsmen of the day. It is supposed that he has ridden the winners of more great races than any jockey of his time. In 1823, he won the Derby and the St Leger, receiving one thousand pounds from a Scotch gentleman (a great winner) as a reward for the latter; and in the following year he went a step beyond this. He won the Derby, Oaks, and was married, all in the same week; fulfilling, as some asserted, a prediction—according to other authorities, a bet. We may also notice his kindness towards his family, which we have reason to believe is most creditable to him. As a jockey, he is perfect.

William Clift is next entitled to notice, as one of the oldest, the steadiest, and best of the Newmarket jockeys, and famed for riding trials, but he has taken leave of the saddle. William Arnull, who has ridden for most of the great sportsmen of the day, has long been in esteem at Newmarket, and considered particularly to excel in matches. He has been much afflicted with gout, but when well, is a fine rider, and steady and honest, as his father was before him. Being occasionally called upon to waste, he feels the inconvenience of his disorder, and the following anecdote is related of him:—Meeting an itinerant piper towards the end of a long and painful walk, "Well, old boy," said he, "I have heard that music cheers the weary soldier; why should it not enliven the wasting jockey? Come, play a tune, and walk before me to Newmarket." Perhaps he had been reading the Mourning Bride.—*Quarterly Review.*

EDINBURGH: Published by WILLIAM and ROBERT CHAMBERS, Booksellers, No. 19, Waterloo Place; and sold by all Booksellers in Edinburgh and every other town in Scotland.—Agent for Glasgow, JOHN MACLEOD, 20, Argyle Street.

☞ Subscribers in town may have the Paper left at their houses every Saturday morning, by giving their addresses at 19, Waterloo Place. Price of a quarter of twelve weeks, 1s. 6d.; of a half year of twenty-four weeks, 3s.; and of a year, 6s. 6d. In every case payable in advance.

In LONDON, an Edition is published, with the permission of the Proprietors, by SMITH & ORR, Paternoster-row, for circulation throughout England and Wales.

Typography executed by W. and R. CHAMBERS; stereotyped by A. KIRKWOOD; and printed by BALLANTYNE and COMPANY, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER," AND "INFORMATION FOR THE PEOPLE."

No. 88. SATURDAY, OCTOBER 5, 1833. PRICE THREE HALFPENCE.

MAKERS AND SPENDERS.

THIRD ARTICLE.

THERE is a common remark, that, while some persons are blamed and punished for the least transgression, others, who seem as if they were favourites with society, may err as widely as they please, and the world will think of nothing but how it may most plausibly excuse them. This is in a great measure a false, as it unquestionably is a dangerous, supposition; but there are certainly some peculiarities of character of so valuable a kind, that individuals who bear them, are, for their sake, apt to be excused for many trivial offences.

There are some cases of insolvency where this is highly observable. The most of men who fall into this misfortune sink under a sense of mortification and disgrace, from which even conscious rectitude may not redeem them. Fearing they can never regain the respect and confidence of the world, they lose all respect for themselves, all confidence in their own energies, and, falling perhaps into bad habits, soon become objects of pity to all their former acquaintances. There are, however, some cases of insolvency, where, even with less conscious rectitude, the individuals are in a great measure safe from this declension, being floated up by certain circumstances in their situation and general conduct, certain specious and external virtues, which, however unattended by real merit, the world is under some necessity of respecting.

Should the insolvent, for instance, be a decent family man—one who has long maintained what is considered a respectable place in society—who has sat at good men's feasts, and given good feasts himself—who has fulfilled all the regular duties which the world thinks requisite, and committed no glaring error or offence—in short, a good citizen and neighbour:—in that case, so useful are such qualities, and so necessary is it to honour them, that he will be excused by the world for a delinquency, the tenth part of which would have brought execrations upon the head of another man, whose business habits were perhaps better, whose intentions were purer, and whose misfortunes were far less of his own procuring, but whose domestic reputation was not perhaps so good. In the one case, people recollect the exemplary appearance of the man in the midst of his family, and, regretting that a scene so decent and laudable should be broken up, do much perhaps for the restoration of his former circumstances: in the other, there is no such appeal to their moral feelings, and they permit the individual to go down the wind without even a desire that he should be restrained. In some cases, the unfortunate individual has far more anchorages in the good will and respect of the community than others. For instance, he may act as an elder or office-bearer in a place of worship, and thus be identified, in the eyes of many persons, with all that is venerable and good. In such a case—so great are the advantages which a bad man may take of a decent position—he may break and break and break, over and over again, seriously injuring hundreds of his neighbours, and, in fact, living by a mere system of spoliation; and yet he will still be excused—still find friends to set him once more into credit. It is indeed a remarkable proof of the determination of the world at large, to encourage the external ordinances of virtue, that men who pay the proper respect to these, are thus safe from even the most deserved censure for occasional trespasses. And it should be a lesson of great force to all who are entering the world—showing that, without a regard for what society has agreed to consider the decencies of life, no man, let his other merits be what they may, has a fair chance in competition with his fellows. The philosophy of the question is simply this: the external decencies alluded to are above all things necessary; without them, nothing could be right—with them, there can only be partial wrong: hence, for the sake of encouraging them, a premium is held out, offering to those who will rigidly practise them, a lenient consideration for many venial errors that would otherwise be sharply rebuked. There is a great deal, moreover, in establishing a general reputation. The world has not time to try every offence by particular evidence: it refers such things in a great measure to general character. If that be good, few things are severely punished; if it be evil, the individual is in danger of having every movement, even the most innocent, interpreted into a crime. Indeed, without the habitual practice of religion and virtue, there is no respect, no advantage of any kind, *not even common safety*.

Of all the ways of spending what others gain, that which we have just indicated is perhaps the most promising to those who may be disposed to practise it. In most of the other modes, the spender depends in some measure upon the bounty of Pity—a passion which has never been found regularly liberal in its disbursements. *Here* he depends upon the credulity and facility of commercial men, whom he has wheedled with his good general character, and the respectability of his domestic circumstances. Be it observed, men will sometimes give away scores of pounds on credit, while they would grudge the most trifling sum to an honester mendicant, who makes no profession of a design to return the money. One of these plausible men will thus sometimes continue, during a long course of life, to defraud the public every year of the sum which he requires for his household expenses, besides something infinitely greater to support his imprudences in business: and though a balance to a large amount is struck against society every third or fourth year, still, somehow or other, it is all excused to him—still he keeps up the same house—still he and his family retain their usual acquaintances, and his eldest daughter is spoken of as an agreeable woman; every thing goes on as usual; nothing will depress him into the victimhood which overtakes so many better men; they will not banish him or his black coat from the post of decency which they occupy every Sunday: whatever should happen, he must still be what he has ever been—he must still have about three hundred pounds a-year.

We have adverted to the idea of a black coat, and must here say a little more upon that particular branch of the subject. A black coat, to many of our readers, will appear a thing of no particular virtue, if the person wearing it be not otherwise entitled to respect. But this is a most mistaken notion. A black coat, upon whatever back it may appear, is a thing of immense importance and effect. It is the principal outward symbol and sign of respectability; and no sensible man, whatever be his circumstances, will ever be without so essential a necessary of life. Want a black coat, and, whatever be your prospects in the world, whatever your talent, knowledge, or virtue, you are viler than sea-weed: have one, and, even though you failed in business only yesterday, you are in a condition to command the obeisance of mankind. We speak with the more confidence on this subject, from having once known a ruined tradesman—a man destitute of all the extrinsic advantages already described—who kept himself afloat for about fifteen years by means of a black coat alone. How this man got his black coats, we cannot tell; but certain it is, that, come from what quarter they might, he always had one. His brother was also an outcast like himself; but there lay between them this mighty difference, that the one always kept up a good black coat, while the other did not. It was curious to mark the various fortunes which resulted from these various circumstances. Thomas, who kept up the black coat, was able, every now and then, to push himself into some humble kind of business—to take a shop, to get one or two visionary barrels erected upon shelves, and obtain credit for perhaps a gallon or two of spirits, and a few dozens of strong ale. No matter that he sunk again before the next rent-day; it was always meat and drink to him in the meantime; and his obscuration at Fountainbridge did not prevent his rising again next month, by virtue of the eternal black coat, at the Abbeyhill. Thomas, in short, carried on a war of this kind for the length of time we have stated; and, low as his expedients might be, he always had the appearance of a respectable man. Dick, on the other hand, who had not the same philosophical views respecting the efficacy of a black coat, sunk into utter wretchedness and want; or, if he had any resource at all, it was in the somewhat less extreme wretchedness of his brother. It might thus be said that both depended upon one coat: that single useful *investment*, though in the eye of the world exclusively belonging to Thomas, also served Dick. It did not serve him, indeed, as a garment: Tom had too much regard for it to trust it for a moment off his own back. But it served him indirectly as a means of getting those occasional morsels upon which he lived. Society, it must be confessed, proved at last too many for both of these gentlemen, and their black coat into the bargain—as it always does sooner or later with those who violate its great rule of honest labour; but still it was proved that one man could in a manner half live, and another exist to the extent of perhaps a still larger fraction, for fifteen years, upon the garment we have alluded to. It was not that the coat was less powerful, but society more, that it at last failed in its grand end of enabling its proprietor and his dependent to use what they did not make.

In a family of the kind described at the beginning of this article—supposing it to have fully got into the habit of living upon the substance of others—it is curious to observe how characteristic is every circumstance connected with it. If either a son or a daughter marries, it is sure to be some person equally unsubstantial with themselves—some denizen of a similar house of misery and vain show—and accumulated wretchedness is the only result. All the outgoings and incomings of the family—every transaction of any of its members—its eating, its drinking, its dressing, its washing—betoken a shabby and unprincipled system, the result of long-continued dependence upon the labour of others. The acquaintances of the family gradually cease to be of a respectable stamp, and are at last found to be either young and inexperienced persons who have *something*, or individuals of a maturer age who have *nothing*. The falling of a person who has any thing into a society such as this—which sometimes does happen—is like the falling of a drop of water upon dry sand: his whole substance is almost immediately evaporated away, and he speedily becomes as arid and unproductive as themselves. Of course, no full-grown person who at once possesses sense and pence will trust himself for a moment in the company of such a fraternity. There are some persons, however, who have pence without sense, or at least are entrusted with the administration of pence by other

people; and these occasionally fall into the hands of the ungaining spenders, by whom they are generally made a glorious prey. The result is like that which attends the thrusting of a small dead animal into an ant's nest: if you come back in a day or two, you find it as clean a skeleton as if it had been bleached for centuries by the sun and wind.

POPULAR INFORMATION ON SCIENCE.

ATMOSPHERICAL ELECTRICITY.—PART I.

As we proceed in our inquiries, even through the most popular departments of natural history, we shall occasionally meet with phenomena that appear to be veiled in impenetrable mystery; but the progress that has been already achieved by the toils of science, and the wonderful discoveries that have been effected, encourage us to most earnest perseverance, and warrant the most sanguine expectations that light will be yet thrown on the paths that are now so obscured. The astronomer has discovered the laws which regulate the motions and courses of the distant heavenly bodies; the geologist has penetrated into the bosom, and exposed the internal structure of the loftiest mountains and the deepest vallies; the chemist has broken down, tried in his crucible, and analysed every tangible substance; but there are yet agents of infinite importance which minister to the great economy of nature, and which are of so subtile a description as to escape being tested by the most delicate modes of investigation. Ages passed away, during which the most zealous and accomplished philosophers had no conception of the existence of that universally pervading fluid, which still flashed round them in the lightning, and shone in the fiery prodigies, which, from time to time, swept athwart the disturbed aspect of the heavens. It had been known that amber, when rubbed, possessed the property of attracting light bodies to it; it had been observed that by similar means some other substances would display the same power; but the genius of discovery yet moved only slowly onwards, and it remained for the illustrious Dr Franklin to apply what he had seen on a small scale from electrical batteries, to the phenomena which are observed during thunder-storms. It occurred to him, that by means of a common kite he should have a ready access to the regions of thunder, and, by attaching a proper conductor to the kite, he expected to succeed in drawing down the electric fluid. His experiment was completely successful. Subsequently, the method of performing the experiment with the kite was materially improved, and philosophers now became convinced of the fact, that, under particular circumstances, clouds become highly charged with electrical matter, which in such storms flashes from cloud to cloud, or down to the earth, which may be regarded as the proper reservoir of this mysterious and subtile agent.

Having now, then, established the fact that this invisible fluid exists, and indeed pervades all bodies, we must next understand, that, when accumulated beyond its natural quantity in any body, it will discharge itself to the nearest and readiest conductor that may come within what may be called the "striking distance." This electric fluid, however, does not pass so readily along some as along other bodies: thus, through glass, sulphur, silks, atmospheric air, &c., it passes very slowly, if at all; and these are, therefore, called BAD or NON-CONDUCTORS, while, through metals, charcoal, melted wax, water, &c., it passes very readily, whence they are termed GOOD CONDUCTORS. Its passage through some metals is incredibly rapid; it is truly "swift as the lightning which doth cease to be ere one can *say* 'It lightens.'" Through a wire extending a length of more than two miles, Dr Watson and several of the members of the Royal Society passed an electrical charge, and the gentlemen at each extremity of the wire felt the shock at the same instant. In another of Dr Watson's experiments, the circuit through which the electricity passed was nearly six miles in length, yet no sensible interval elapsed during the passage of the fluid from one extremity to the other. We have stated that the air is a bad conductor; but when it is removed —that is, when a body is placed in an exhausted air-pump, or in a vacuum—its electricity escapes rapidly. How, then, does it happen that the air becomes at times so highly charged with electricity? The reason is this, that water is a good conductor, and it is the aqueous vapour in the atmosphere that becomes thus impregnated. Instances are recorded, on the best authority, of the atmosphere having been surcharged to a remarkable degree with electric matter. Cæsar informs us in his Commentaries, that, in the African war, after a tremendous storm, the points of the darts of the soldiers shone with a spontaneous light. "In the month of February," says he, "about the second watch, there suddenly arose a great cloud, followed by a dreadful storm of hail, and in the same night the points of the darts of the fifth legion appeared on fire." During the night before the battle which Posthumius gained over the Sabines, the Roman javelins emitted a light like torches; and a similar exhibition occurred during the war which Belisarius waged against the Vandals. In all these instances, the atmosphere was, in the manner we have described, highly impregnated with electric fluid, and the metal of the spears and javelins being good conductors, attracted it visibly. Owing to the same cause, the hair of the head has appeared as if on fire, an instance of which Pliny states that he himself witnessed. The manes of horses and the tips of their ears have on such occasions appeared luminous.

The electric matter, or some peculiar modification of it, occasionally collects, as in balls or masses of fire, which, without doing any harm, alight on or descend round the masts of ships. They are by seamen called the FIRES OF ST ELMO; and when only two appear, one on each mast-head, they have been called CASTOR and POLLUX, because such a light appeared on the caps of each of those heroes when they sailed in the Argonautic expedition. We shall here pause to describe this phenomenon, before proceeding to others connected with atmospherical electricity.

ST ELMO'S FIRE—CASTOR AND POLLUX.

When a ship, bearing a bold and intrepid crew, is sailing beneath a sky that may be said to be pregnant with lightning and other fiery meteors, her position is truly fearful and sublime. The sea that bears her along becomes agitated—the thunder moans in the distance—

> "High on the mast, with pale and livid rays,
> Amidst the gloom, portentous meteors blaze."

"In the month of June 1808," says an observer, "passing from the Island of Ivica to that of Majorca, on board a Spanish Malacca ship, fitted as a cartel, and manned by about thirty Russians, Genoese, Valencians, and Catalonians, a fine southerly gale, by seven in the evening, brought us within six or seven leagues of the anchorage in Palma Bay. About this time, the sea-breeze failing us astern, was shortly succeeded by light and baffling breezes off the land. No sooner had the setting sun withdrawn his golden beams from the tops of the lofty hills which rise to the westward of the town, than a thick and impenetrable cloud, gathering on the summit of Mount Galatzo, spread gradual darkness on the hills below, and extended at length a premature obscurity along the very surface of the shore. About nine, the ship became becalmed. The darkness was intense, and rendered still more sensible by the yellow fire that gleamed upon the horizon to the south, and aggravated by the deep-toned thunder which rolled at intervals on the mountain, accompanied by the quick rapidity of that forked lightning whose eccentric course and dire effects set all description at defiance. By half-past nine, the hands were sent aloft to furl top-gallant-sails and reef the topsails, in preparation for the threatening storm. When retiring to rest, a sudden cry of ST ELMO and ST ANN was heard from those aloft, and fore and aft the deck. An interpreter called lustily down the hatchway that St Elmo was on board, and desired me to come up. A few steps were sufficient, and to my great surprise I found the topsail-yards deserted, the sails loose, and beating in the inconstant breeze, the awe-struck and religious mariners bareheaded, on their knees, with hands uplifted, in voice and attitude of prayer, in earnest and muttering devotion to St Elmo and St Anne. On observing the appearance of the masts, the maintop-gallant-mast-head, from the truck, for three feet down, was perfectly enveloped in a cold blaze of pale phosphorus-looking light, completely embracing the circumference of the mast, and attended with a flitting or creeping motion. This curious illumination continued with undiminished intensity for the space of eight or ten minutes, when, becoming gradually fainter and less extensive, it finally disappeared, after a duration of above half an hour. The seamen, in the meantime, having finished their devotions, and observing the lights to remain stationary, returned promptly to the yards, and, under favour of this "spirit of the storm," now performed that duty which on a critical juncture had been abandoned, under the influence of their superstitious apprehensions. During the prevalence of the lights, as well as through the remaining hours of the night, the wind, with the exception of occasional puffs, continued light and variable, and the morning returned with a clear sky, a hot sun, and a light southerly breeze, which in due time brought us safe to our anchorage at Palermo."*

The author of the Memoirs of Count de Forbin, in describing a storm at sea, also observes, "We saw upon different parts of the ship above thirty of St Elmo's fires, and among the rest there was one upon the top of the vane of the mainmast more than a foot in height. I ordered one of the soldiers to take it down. When he was on the top, he heard the fire, and stated that its noise resembled that of fired wet gunpowder. I ordered him to lower the vane and come down; but scarcely had he taken the vane from its place, when the fire fixed itself upon the top of the mainmast, from which it was impossible to remove it."† Sailors superstitiously believe, that so long as this light glows stationary on the mast-head, the vessel is under the friendly guidance of this aërial demigod; but if it descend, they prognosticate a gale of wind, or some other disaster, the severity of which they consider indicated by the depth of its descent.

On all these occasions, the atmosphere, by means of the moisture it contains, was preternaturally charged with the electric fluid, which, under ordinary circumstances, remains invisible, and produces no sensial phenomenon. It is only when its equilibrium is disturbed that it becomes perceptible to us. If we charge a body with more electric matter than it should naturally contain, and bring it near to one which contains less than it should naturally possess, the fluid from the former flashes immediately to the latter, and, in so doing, light, heat, and sound, are emitted. When the electric light is examined by means of a *prism*, it is found to be composed of the same seven coloured rays as the solar light; but the proportion of the rays and colour of the sparks varies according to circumstances. "A short spark," says Dr Thomson, "is always white; a long spark is usually reddish, or rather purplish." When the spark is feeble, the most refrangible of the primary rays appear; but when strong, it is of dazzling whiteness. As the late Sir John Leslie however observed, the species of the light emitted depends very much on the peculiar nature of the substance affected. A lump of sugar glows with a green light when electrified. A ball of wood or ivory emits a crimson, and a body of powdered charcoal throws out a yellow gleam. The heat evolved is best exemplified by the effects of lightning, which has been repeatedly known to melt iron; nay, even it has been observed to vitrify, or convert into a glassy substance, the sand which it has struck; in confirmation of which curious fact, we may cite the following from the London Literary Gazette:*—"It is well known, that, on the highest mountains, tubes of vitrified matter have been found, the exact mode of the production of which has been hitherto undiscovered, but which natural philosophers have in general ascribed to the effects of lightning falling on a sandy soil, and melting or vitrifying the sand to a greater or less depth. All doubt on the subject is now removed by similar tubes having been seen instantly formed in places where lightning has fallen. M. Fiedler, a young German philosopher, has collected several in Germany, which he has presented, through M. Arago, to the French Academy. They are remarkably large: one is about nineteen feet long. It is difficult to conceive how the discharge of an electrical cloud can melt and vitrify a mass of sand so dense. A similar effect could scarcely be produced by the most intense furnaces." The loudness of the sound will depend on the intensity and rapidity of the shock, and the extent of the surface of the body whence the discharge takes place. If the ball which terminates the discharging rod be tapered to a point, the sound becomes dull and obscure, and the more so, as the point is rendered more acute. When the vibrations succeed each other very quickly, their impressions are confounded on the ear into one sound. But this will be further considered, when we proceed to examine the causes of, and phenomena attending, thunder-storms.

PERILS OF A DUTCH CREW WINTERING AT NOVA ZEMBLA.

TOWARDS the close of the sixteenth century, the spirit for commercial adventure made rapid progress in Holland, and various companies were formed to promote the interests of traffic. Sensible of the great advantages that would result from shortening the voyage from Europe to the distant climates of the East, the Dutch were at an early period occupied in searching for a passage by the north, which, according to the geographical opinions prevailing in that age, would conduct their fleets to China, Japan, and other places, in half the usual time. Though their attempts in this respect ultimately proved abortive, they were not void of utility, and led to some interesting incidents, which are partly contained in the following narrative.

Three ships sailed from the Texel in 1594, accompanied by a fishing bark, for the purpose of discovering the northern passage, and reached as far as 77° 45′ of north latitude, when a vast surface of ice, extending to the utmost limits of the horizon, obstructed their progress. Their commanders, after betaking themselves to the boats, and examining those creeks and shores which they were able to gain, considered it impracticable to proceed, and returned to Holland in about fourteen weeks from their departure.

Notwithstanding this disappointment, another voyage was resolved upon, and its success so confidently anticipated, that no less than seven vessels, six of which were laden with commodities for eastern traffic, sailed on the same pursuit, in the course of the following year. These vessels found Russians collecting whale-oil and the teeth of the sea-cow in latitude 72° or 73° north, with whom they interchanged mutual civilities, and saw a race of people, whom they called Samoides, at the entrance of the Waygat's Straits. Soon afterwards, the ice opposed their advancing towards the north-east, into what they supposed the open ocean; thick fogs prevailed, and a continual change of wind. They passed through the Waygat's Straits, however, and landed at Statten Island; thence surveying the surrounding sea, and observing great quantities of ice drifting from the east, they returned through the Straits, and abandoned the passage as impracticable.

Though these successive failures repressed the ardour of the Dutch, they did not lose sight of an object which they had viewed with such predilection; and two vessels were once more fitted out at the charge of

* No. for March 29, 1828.—Art. Natural Vitrifications.

the city of Amsterdam, for resuming the voyage of discovery by the north. One of them was commanded by Jacob Hemskirk, an experienced mariner, with whom was conjoined William Barentz, as pilot, a navigator enjoying equal reputation, and who had, besides, been out in both the preceding voyages. In the same vessel, also, was Gerard de Veer, the author of the only history of all the calamities and adventures which ensued in prosecution of the enterprise. John Cornelius Ryp was master or supercargo of the other.

On the 22d of May 1596, the two ships left Holland, and soon afterwards a strange phenomenon was observed in the heavens, consisting of three suns, all visible at a time, each within a parhelion, and a rainbow traversing the whole: besides which, other two rainbows likewise appeared.

Detached flakes of ice were seen floating on the 5th of June, which the people on board, at first sight, took for a flock of swans swimming in the sea, until a nearer approach proved their error. Sailing through water of a deep green colour, they discovered an island about five miles long, in 74° 30′ north latitude, on which they landed.

The party with Barentz having descried a white bear in the sea, pursued it in the boat, in hopes of being able to cast a noose round its neck. But, on closing with the animal, its size and menacing aspect deterred them, until they obtained a reinforcement of men and arms. Yet during four glasses that a renewed encounter lasted with the bear, all their exertions to destroy it proved unavailing; and it actually swam away with an axe struck into its back. The boat followed, and one of the men at length cleft its head asunder by the blow of a hatchet. The skin of this enormous animal was twelve feet long; but the people did not relish the flesh. The incident induced them to name the land "Bear's Island."

Prosecuting their voyage, they got so far north as 80° 11′, where, after a combat almost equally severe, another bear, whose skin was thirteen feet long, was killed; and they found vast numbers of wild geese hatching their eggs on land in that high latitude. Ranging along the coast, they found a good haven, but could get no farther north on account of fields of ice. The navigation was therefore pursued in somewhat lower latitudes, wherever the ice gave access, until the 1st of July, when Barentz and John Cornelius Ryp, disagreeing about the course to be followed, parted while in sight of Bear's Island.

On the 17th of July, Barentz saw the coast of Nova Zembla, near Lom's Bay, and three days afterwards, being obstructed by the ice, anchored at Cross Isle. Here eight men, having gone ashore unarmed, had a narrow escape from the pursuit of two bears.

The vessel was now amidst extensive fields of ice, and huge masses, to which she was occasionally secured in her progress, appeared floating, or had run aground. One of these was calculated to be sixteen fathoms above the water, and thirty-six under it, that is, more than three hundred feet from the summit to the base. The great fields of ice began to break up, with a noise like thunder, on the 10th of August, and the ship being fast to a huge piece aground, not less than four hundred, of smaller size, were driven past her by a current. Lest she should be carried away by the ice, she was brought nearer the coast, into a more sheltered station; but it was soon necessary to shift her anchorage, according as circumstances required.

Climbing to the top of a lofty mountain in Nova Zembla, the mariners were encouraged with the prospect of an open sea towards the south-east, and concluded that they should thence be able to accomplish the voyage. But after repeated difficulties, losing a boat and also the ship's rudder, they were completely surrounded by ice on the 27th of August. Temporary intervals, wherein the ice separated, succeeded; but at last the ship was enclosed and frozen in on all sides, so that the people were obliged to have recourse to the shore.

There they found a fresh-water river about two miles inland, and saw the traces of animals, which they conceived to be deer: great store of wood likewise lay near the river, consisting of entire trees with the roots, drifted from other countries. Thus having no alternative, the Dutch resolved to winter in this desolate region.

Meantime, the ice accumulated greatly round the vessel: her prow was raised far above its surface, while the stern, sunk behind, was crushed together in such a manner, that the cracking of the timbers rendered the mariners apprehensive she would be utterly destroyed. They had dragged their boat over the ice to the land, and in the next place got out a quantity of arms, ammunition, and provisions, wherewithal to fortify themselves against wild beasts and hunger during their dreary abode.

On the 14th of September, they began to collect the drift wood for building a hut, and prepared sledges, with which it was with great labour drawn over the ice and snow, near to the place where the vessel lay. Thirteen men were employed in dragging the sledges, and three in preparing each ladening of wood; but they could make no more than two trips a-day, from fatigue and the approaching darkness.

Whilst thus industriously occupied, the carpenter unfortunately died on the 23d of September, and was next day interred by his surviving comrades, in the cleft of a hill, as the ground was too hard for them to dig a grave. There were now sixteen persons in all, but some of the number frequently indisposed.

The rafters of the hut were laid, though, on account of excessive cold, the people were scarce able to work; and if any of them chanced to put a nail in their mouths, as workmen are wont to do, it stuck to the skin, and blood followed its removal. Nothing but urgent necessity could have induced them to continue their operations. A great fire was kindled all around the hut, to thaw the earth, that they might bring it up, and make the under part a little closer: the ground, however, was frozen so very hard and deep, that it would not yield on that occasion, and there would have been too great a waste of wood in trying it again.

The people having shot a bear, took out its entrails, and set it upright on its four legs to freeze, in which state they meant, if possible, to carry it to Holland. Some time afterwards, a seaman being suddenly surprised and pursued by another bear, hastily ran towards the ship, with the bear following him, until it reached the first, now frozen over, and totally covered, except one of the paws: here the animal made a stop, and allowed the man time to save his life.

At length the hut was finished on the 12th of October 1596, when half the crew left the ship, to sleep that night ashore: but they suffered severely from the cold, owing to scarcity of bed-clothes; and as the chimney was not completed, the smoke in the hut was intolerable.

In the next place, the launch was dragged ashore with incredible difficulty; and as the absence of the sun was about to leave the seamen in perpetual night, they made all possible haste to land the remainder of the provisions required. They had no hopes of the vessel floating, on which account the rudder was also carried away for preservation, until the ice might thaw in the succeeding year.

The preparations for wintering in Nova Zembla were completed, while the sun was still visible from the surface of the earth. On the 30th of October, a lamp was fitted to burn all night, and supplied with melted fat of bears which had been killed for oil. On the 2d of November, only part of the sun was seen in the horizon; and on the 4th he had sunk entirely under it.

At this time the surgeon contrived a bath for the people in a cask, which was found extremely salutary and beneficial, from their confinement. Setting traps in the neighbourhood, they caught white foxes, which began to be quite common, whereas the bears had entirely left them as the sun disappeared; and their flesh, resembling that of a rabbit, was much relished by the people. A device was soon adopted of placing the traps, so that the captured animal could immediately be drawn into the hut.

On distributing the bread, each man's allowance was restricted to four pounds five ounces in eight days; and as the strength of the beer brought ashore had been destroyed by successive freezing and thawing, each had two small cups of wine daily. A large Dutch cheese was ate by the whole company, and sixteen remaining delivered to the people, each being left to his own economy.

Repeated storms of snow, at this period, began to block up the hut without; and within, the cold was almost insupportable. While the people washed their linen, it froze immediately when taken out of warm water: nay, one side froze while the other was next the fire. They were almost suffocated from the closeness of the hut not allowing proper vent to the smoke; but the fire falling rather lower than usual for some days, ice formed two inches thick on the floor, and the beds were even covered with it. Except when cooking their provisions, the people lay constantly in bed, and then they heard such explosions among the ice at sea, as could only be occasioned by huge mountains bursting asunder, and tumbling down into a confused heap of fragments. Intense cold having stopped their clock, though additional weights were hung to it, they prepared a twelve hour sand-glass, to enable them to ascertain how the time passed.

The cold was so intense on the 6th of December, that they scarce expected to be able to survive it. Nothing could keep them in heat: their wine froze, and they were obliged to melt it every two days, when half a pint was served out to each man. It was their only liquid except snow water; a beverage not very suitable to their condition.

Before this time, the day was so dark, that the mariners could not distinguish it from night: so that on one occasion, when perplexed by the stopping of the clock, they continued in bed, believing it was still night; and on another occasion they only knew that it was night by the moon shining bright, and remaining constantly above the horizon.

On the 7th of December, they considered it necessary to repair to the vessel for some coal that had been left in her, and with this made a good fire in the evening, which revived them greatly. To enjoy its comfort as much as possible, they sat up late, and closed all the apertures of their hut to keep in the heat. But a seaman, already indisposed, who could bear the effect of the fire less than the others, began to complain, and all soon found themselves attacked with giddiness; whence they could scarce stand until opening the door. In fact, he who first reached it, swooning away, fell out on the snow. Gerard de Veer, however, recovered him by sprinkling vinegar in his face, and the admission of the fresh air removed the sensations overcoming the others. The captain then distributed a glass of wine to the men to strengthen them.

The leather of the seamen's shoes was now frozen to such a degree of hardness, that they could not use them; on which account they made a kind of slippers of skins, and put several pairs of socks over one another to increase the heat. The ice stood an inch thick on the sides of the hut, and when they went out in clear weather, their clothes were whitened with frost and shining icicles. The fire was increased within, taking the precaution of leaving the chimney open, that the smoke might get vent.

Many stars being visible on a clear night, the Dutch, by an observation on the 14th of January 1597, found themselves in 76° of north latitude. About that time the wood brought into the hut being all consumed they began to shovel away the snow on the outside, to come at more, which, on account of the excessive rigour of the weather, was with difficulty accomplished.

Seven of their number next repaired to the ship, and found the ice had risen higher within, and that she was still fast frozen up. In the cabin they caught a fox, which was carried home and ate.

Several successive days of stormy weather confined the mariners to their hut. There they heard the foxes running over it, and, as their provisions were beginning to decline, regretted that they could not catch them. But the intense cold almost absorbed all other sensations, and they had recourse to hot stones laid on their feet and bodies, to keep them warm. However, they comforted themselves, that, as the sun was now at the lowest, he would not be long of returning to gladden them with his view. While sitting before the fire, their backs would be quite white with the frost, and, on stretching their feet towards it for warmth, their stockings would be burnt before they began to feel its influence. A cloth hoisted on a pole, thrust up through the chimney, to show the direction of the wind, immediately became stiff and inflexible.

In this way did the year 1596 terminate, and 1597 begin.

Though it proved necessary to diminish the allowance of wine, when twelfth night arrived the seamen requested the captain to permit them all to make merry, with some savings of the wine, which several, instead of consuming, had stored up. Therefore, they made pancakes with meal and oil, and, soaking biscuit among wine, were as jovial as if they had been at home in their own houses in Holland.

Again visiting the ship, it was evident to them that bears of different sizes had been there, and on striking a light, and going below, they found the ice a foot higher than formerly. Almost despairing that the vessel would ever float again, they thought it prudent to spare the remaining coals, lest they might find themselves obliged to attempt navigating homewards in the open launch.

The foxes, in the next place, beginning to disappear, indicated the return of bears; for so long as the latter retreated, the former came out, and were but little seen when the bears were numerous.

On the 24th of January, the day being clear, with a west wind, Gerard de Veer, Jacob Hemskirk, and another, went down to the sea-side, towards the south of Nova Zembla, from whence they unexpectedly saw the edge of the sun above the horizon. They hastened to impart the welcome tidings to Barentz and their other companions; but their report was discredited; for Barentz affirmed that it was too early for his return by fourteen days. The two following days being dark and cloudy, doubts of the fact were still farther entertained, and many of the people positively affirmed that it was impossible. On the 26th, a man died who had been some time sick, and next morning his comrades, with great difficulty, owing to the excessive cold, dug a grave for him in the snow, seven feet deep. Having performed the last offices to him, attended by such funeral service as circumstances would admit, they returned within the hut to breakfast. Then discoursing concerning the prodigious quantity of snow which unremittingly fell in the place, they said among themselves, that, if again blocked up by it, they should find a way of climbing out through the chimney; accordingly, the captain tried the experiment, while another going out of the hut to ascertain whether he succeeded, saw the complete orb of the sun above the horizon.

The weather still remained uncertain, though the people, relieved from the tedium of perpetual night, took exercise to strengthen them. But their hut was repeatedly blocked up by snow, and to avoid the labour of always clearing it away from the door, they on those occasions found an exit by the chimney.

Bears began to return along with the sun, and one which was killed afforded at least a hundred pounds of grease, which the seamen melted for their lamp, But a number of foxes coming to devour the carcase, the apprehension of other bears being attracted hither induced them to bury it deep under the snow. They considered it expedient to collect more wood for fuel, dragging it on a sledge as before: however, their strength being much reduced, their task was accomplished with far greater labour. Though the cold moderated for a time towards the end of February, its rigour increased about the middle of March, and on the 24th of that month the hut was totally blocked up.

At last the sea began to open, though the mariners despaired of disengaging the ship, or of rendering her serviceable for a voyage. Still she was hemmed in by

ice, sometimes heaped in mountains around her: and their anxiety was increased by observing that, about the middle of March, the sea was so open, that the vessel was within seventy-five paces of it; whereas, a new frost increased the distance on the 4th of May to five hundred paces.

Thus the only means of quitting Nova Zembla seemed to consist in the launch and boat; but the 29th of May arrived before the people attempted to dig either out of the snow. However willing, their reduced strength rendered their progress slow; and after they had laboured hard, compelled them to desist: on another trial they were put to flight by a bear. Six days' work at length enabled them to put the launch in a condition to be dragged over the hard ice and snow to the ship. There they sawed off the stern, which was narrow, and built one broader and higher, so that it might be better adapted to stand the sea.

The boat was in the same way got out of the snow, and dragged to the ship, as also several sledges laden with articles from the hut. These operations occupied a long time; they were frequently interrupted, and ultimately accomplished with great difficulty, from the state of the weather and repeated dangers. Nevertheless, on the 12th of June, nothing remained but to smooth the way for the launch and boat, down to the water's edge, and drag them along on the 13th.

This being done, William Barentz, the pilot, wrote a brief recital of what had happened: that he and his companions had left Holland for the purpose of sailing to China by the north; but their ship being frozen up by ice, they were compelled, amidst many hardships, to winter ashore. The narrative he put into a musket barrel, hung up in the chimney of the hut, lest any mariners in future might experience a like adventure. The captain also thought it proper to obtain the subscription of his company to a narrative of their dangers and distresses, and of the necessity to which they were at last reduced, of hazarding a voyage homewards in two open boats.

Eleven loads of goods were in the next place dragged to the water's edge, and then William Barentz and Claes Andrisz, who had long been sick, were drawn on a sledge from the hut to the boats. The whole company was equally divided, and one of the sick attached to each, and, on the 14th of June 1597, after ten months' dreary residence, the mariners set sail with a westerly wind from Nova Zembla.

After undergoing innumerable hardships, the twelve surviving mariners reached Holland, and, to the admiration of the citizens of Amsterdam, appeared in their Nova Zembla apparel. The fame of their adventures was soon disseminated, and they were carried from thence, to entertain the foreign ambassadors at the Hague with a recital of what had befallen them.

SCOTTISH STREAMS.

THE CLYDE.

This large and beautiful river may be called the Thames of Scotland, being the most valuable to the country for commercial purposes, and bringing wealth from all quarters of the globe, to be diffused over a rich and populous territory on its banks. It is the only large stream which pours its waters into the sea on the west coast. It is usually understood that this fine river rises from the same hill, at the southern point of Lanarkshire, from whence also flow in different directions the Annan and the Tweed; but this is only partly correct. The common notions regarding the sources of rivers are frequently altogether fanciful, almost every stream having a number of heads, often not one of which can be justly selected as the chief. Such is the case with the Clyde. It is formed by a concentration of a variety of straggling burns and rivulets, rising amidst the mountains and wastes which separate Lanarkshire from the counties of Peebles and Dumfries. The chief of these tributaries are the Powtrail Water, the Crook Burn, the Evan and Elvan Waters, which coalescing, form a stream, which, after flowing about two miles, receives an accession first from Glengonar Water, and next from Duneaton Water, which constitute it properly the River Clyde, at a distance of upwards of twelve miles from the highest springs of its fountains.

Pursuing a northerly course from its origin to the mouth of Duneaton Water, it continues in the same direction, with a slight tendency to the east as far as Biggar, by which time it has received some more rivulets from the adjacent uplands, when it at once alters its course to the north-west by north. It keeps this direction in almost a straight line to its estuary, except when it makes a considerable semicircular bend to the right a little way below Biggar, till it is joined by Douglas Water on the left. The Douglas Water nearly doubles it in size. It afterwards receives a number of other streams, generally on the left or westerly bank. The Mouse, the Nethan, the Aven, the Calder, the North Calder, the Kelvin, the White and Black Cart, the Forth and Clyde Canal, and the Leven, are its principal tributaries on either side from Lanark to Dumbarton.

The impetus of the waters of the Clyde is very variable. In the upper parts it is rapid, but it soon becomes almost stagnant; winding its path amidst broad rich meadows, in a manner intimately resembling some of the sleepy-looking dull rivers in England. On approaching Lanark, it begins to hasten on its way, in an expanded stream, over a stony bottom, till it approaches the falls, when it proceeds with great deliberation. Of these celebrated falls, two are above and one below Lanark. The uppermost is Bonniton Linn, a cascade of about thirty feet. The next below is Cora Linn, where the water takes three distinct leaps, each apparently as high as that of Bonniton. Between these two falls the course of the water is prodigiously rapid and perturbed. Its channel is contracted, among rocks and precipices, and in some places it struggles through a chasm of not more than four feet in width. Its sides consist of walls of rock, equidistant and wonderfully regular, the jutting points of which are covered with natural shrubbery, and in whose crevices nestle numerous flocks of birds. Upon a rock above Cora Linn, on the southern bank of the river, stands a ruined castle, behind which is a middle-aged mansion, and behind which, again, there is a still more modern and splendid mansion-house. This seat is called Corehouse, and is the seat of George Cranston, Esq., to whom it gives a senatorial title. Corehouse is embowered in the trees and shrubbery which add such grace to the whole of this wild scene. A pavilion, erected above a century ago, stands on the opposite bank of the stream, as a station for observing the fall.

About a mile down the stream from Cora Linn, at New Lanark mills, there is a fall of about four feet in height called Dundaff Linn. Four miles below Cora Linn, and two below Lanark, is Stonebyres Fall, which, like that of Cora, consists of three distinct falls succeeding each other, altogether measuring about seventy feet in height. This is not less romantic than the other falls: wild rugged rocks are equally visible here, and they are equally fringed with wood; but the trees in the neighbourhood are not so tall and stately. There are foot-paths for the use of tourists, along the river at these falls. After a confinement of six miles, in a deep and rocky, but wooded glen, the course through which the Clyde flows gradually opens, the river expands, and instead of being agitated among rude and steep rocks, it flows over a pebbled bed, through alternate tracts of sloping banks and fertile valleys, adorned in some places with a mixture of orchard and coppice wood, and at others with tufts of forest trees.

Thus it proceeds for twelve miles, through the lower part of the parish of Cambusnethan, and the parishes of Dalyell, West Monkland, and Bothwell, on the north side; and those of Dalserf, Hamilton, and Blantyre, on the south. Here, along the banks of the river, the lands ascend gently on both sides, exhibiting sloping banks and a pleasing well cultivated territory. The appearance of its vicinity alters in the parishes of Blantyre and Bothwell, where the banks are bold and richly wooded. From thence they expand and contract alternately to the extremity of the county. Numerous villages, hamlets, orchards embosomed in woods, gentlemen's seats, and the remains of rude magnificent castles and religious fabrics, contribute to enrich the scenery on the Clyde, and the presence of a number of mills of different kinds attests the trading and agricultural wealth of this beautiful district of Scotland.

As soon as the river reaches Glasgow, its character is at once altered from that of a rural simple stream, to that of a natural canal, suited to the purposes of navigation. At and beneath this city it has been in many places hemmed in and deepened, and for about twelve miles, it flows through beautifully wooded meadow land. As it approaches Dumbarton it gradually widens into the character of a firth, from a mile to two miles in width. Below Greenock, it continues to be about two miles in breadth, with a hilly region on both banks, but especially on the Argyleshire side. It shortly takes a sharp turn to the south, and after flowing through the pass betwixt Bute, the Cumbray islands, and the coast of Ayrshire at the Largs, it is emitted into the broad expanse of the sea, between the west coast of Scotland and Ireland, and which partly obtains the title of the Firth of Clyde.

Of late years, the Clyde has been greatly deepened and improved in its navigation betwixt Glasgow and Greenock, and by means similar to those employed on the Thames. Large vessels can therefore now approach the quay at Glasgow at particular states of the tide, and here the view of the various kinds of vessels lying at their appropriate station, at the place called the Broomielaw, is particularly animated. Steam-vessels of all dimensions crowd the channel, and hourly depart for Liverpool, Dublin, Belfast, and innumerable places on the river, as well as the West Highlands and islands. By means of the Caledonian Canal, they even keep up a ready communication with Inverness, on the east coast of the Highlands.

Salmon ascend the Clyde as far as the fall of Stonebyres, and the lower bridge of Glasgow is the first obstacle to the sailing of boats or vessels. From its sources to Bute, its length is fully one hundred miles. In conclusion, we add a recent calculation regarding the waters of this imporant river. The breadth of the Clyde at the New Bridge, Glasgow, is 410 feet, and its mean depth 3½ feet. The velocity of the water at the surface is 1.23 inch, and the mean velocity of the whole water is 0.558,132 inch per second. From these data it may be inferred, that the quantity of water discharged per second is 76⅝ cubic feet. This amounts to 2,417,760 cubic feet, or 473,017,448 imperial gallons, or 1,877,053 tuns. The river Clyde drains about 1-30th of Scotland, or about 1-83d part of Great Britain.

The vale through which the river Clyde flows, from its sources to its mouth, is called Clydesdale; the designation is merely popular, but supplies a secondary title to the Duke of Hamilton.

RAILWAY EXCURSIONS.

It is little more than a year since the coal-proprietors in the southern neighbourhood of Edinburgh completed a short railway for the transportation of their coal to the capital, whereby they might be enabled to compete, on equal terms, with their western rivals, who, though at a much greater actual distance, had been virtually brought nearer by means of a canal. This railway extends from the southern suburbs to a spot some miles beyond Dalkeith, sending off one branch to Musselburgh, while another is in preparation for a connection with Leith—the four towns of Mid-Lothian being thus brought into the closest kind of contact, and the interior of the country connected immediately with the sea-coast.

The proprietors of this useful public work had at first no intention of throwing it open to passengers. The idea of putting their property to that use was started by an enterprising individual connected with their establishment, and, being put to trial, was soon found so highly advantageous as to occasion some considerable changes in their system. From May 1832, when passengers were first admitted, to the same period in 1833, one hundred and fifty thousand persons were carried (an average of about five hundred a-day), producing in all a sum little short of L.4000, one-half of which was appropriated by the shareholders of the railway, to whom it must have been in a great measure a clear profit. During summer, there are about six departures in the day, from all the different extremities of the railway; and it has not been uncommon, on these occasions, to see above a hundred persons moving off at once. This frequentation, to those conversant with the wonders of the Liverpool and Manchester railway, will appear by no means remarkable; but, comparatively, it is quite as much so—quite as triumphant an exemplification of the utility of a railway, and of its power of reproducing work for itself—as that more extensive line has ever presented. Be it remembered, that the existing extremities of this road, opposite to the starting point, are only towns of six or eight thousand inhabitants, presenting no scenes of manufacturing energy worth speaking of, and, though the centres of an agricultural and coal district, yet of one by no means extensive. That such a district should attract and send out about one thousand persons a-day (which has been the average during the summer), is very remarkable, even allowing that many must go for no other object than amusement. It proves, moreover, how effectually the cheapness of a thing tends to promote its prosperity, and how indispensable it now is that all ordinary things should be cheap, in order that the public may avail themselves of their use. The charge for travelling by the railway is so extremely moderate (only sixpence), that many can not only afford it when necessary on business, but also for pleasure, and on these latter occasions not only go themselves, but take a few of their children too. Thousands of persons must thus travel, who would not otherwise travel; thousands enjoy the country air now and then, who otherwise would spend their whole lives in the desert of the city. The good which it does in this way, and in promoting amiable and domestic pleasures among the industrious portions of the community, is altogether beyond calculation.

It is delightful, on a sunshiny Saturday morning to see the well-dressed family groups which flock to the depôt at St Leonard's, in order to depart by the ten o'clock coaches. The honest-looking husband, permitting himself to be amused—the decent mother, with her face of quiet happiness—the children clamorous with expectation and curiosity, are all there—along with many other persons not falling under any such classification. Above all, there is no failing to distinguish the Dalkeith shopkeeper, who has just descended from one of the incoming coaches, being bent on some business in town. His pepper and mustard second-cloth trousers—his grey woollen stockings disclosed at the ankles—his roomy coat of Galashiels blue—his broad unbrushed hat—his unpolished stick cut by himself—his acre-breadth of beard glistering through the ruddy cheek—are marks which cannot be mistaken in this specimen of provincial substantiality. He has either to see a victual-dealer in Clerk Street, respecting some bran and shellings, or to buy a hogshead of whisky in the Grassmarket. The railway depôt is in a somewhat remarkable situation. It

is pitched exactly about the place where the author of the Heart of Mid-Lothian planted the family of Douce David Deans, and immediately under the lofty heights of Salisbury Crags and Arthur's Seat, which form so singular a contrast, in their primitive wildness, to the large city now pressing in at their feet. The spot was lately as suburban and sequestered as could be conceived: but its solitude has been effectually broken in upon; and with its spruce new buildings, starting up in all directions amidst the remains of its former meanness, it might be likened to a sluggard taken by surprise, and who hastily endeavours, by a few ill-put-on and inappropriate accoutrements, to fit himself for appearing before company.

From the depôt, the railway proceeds down an inclined plane of considerable declivity, and at the same time through a tunnel about the fifth of a mile in length, perforated under a slightly elevated part of the King's Park. The carriages descend by their own weight, subject, however, to the control of friction levers, by which the guide can moderate their speed, or altogether interrupt it, by a very slight movement. As you enter the upper end of the tunnel, you perceive the country lying like a picture through the opposite extremity; and the apparent smallness of that aperture, compared with the one by which you are entering, affords perhaps one of the most striking illustrations of the principles of prospective that could be in any way obtained: the further end must be many hundred times less in apparent size than the other. The passage through the tunnel gives an equally forcible illustration of the security which is to be derived from science. For a minute, a horrible darkness prevails, and the whole circumstances are such as generally impress the mind with a sense of danger and terror. You know, however, that you are entrusted to a combination of scientific principles, of unerring accuracy and fidelity, and you accordingly rest as tranquilly in your carriage as if you were moving along an open way in daylight. In returning to the depôt, when you of course ascend through the tunnel, a very striking sight is presented. Suddenly, in the midst of the deep twilight of the scene, a line of carriages rushes past you with the speed of a downward thunderbolt, being simply a train of return waggons, which are employed to take down the opposite end of the rope by which you are ascending. Commonplace as the actual nature and use of this object may be, it strikes the eye in that uncertain light as something supernaturally grand and wild. A dim human figure is seen erect in one of the waggons, who, as he rushes past, appears like a diabolic spirit sailing down the gulfs of Tartarus. The whole pageant is truly terrific.

The lower end of the tunnel is immediately under that lofty basaltic precipice in Arthur's Seat, which bears the popular name of Sampson's Ribs—a piece of scenery as magnificently rude as if it were in the centre of the Highlands. You soon leave this sternly alpine scene, and pass between Duddingstone Loch on the left, and Prestonfield House on the right. This seat belongs to Sir R. Keith Dick, Bart., a family tracing its descent from a rich Edinburgh merchant of the seventeenth century, who distinguished himself by lending large sums to the nation during its covenanting struggles with Charles the First, and, never recovering them, eventually died in great poverty during the protectorate of Cromwell. A succeeding representative of the family held the highest office in the magistracy during the brief reign of James the Second (Seventh of Scotland), and had his house burnt, as was suspected, on account of his obsequiousness to the measures of that unpopular sovereign. It is alleged, however, that this gentleman did not lose by his office. He had the address to make a bargain with the city corporatian, entitling him to all the refuse of the town for a certain number of years, on the simple condition that he would oblige the citizens by carting it away. It is generally believed that this fortunate paction had a great share in restoring the fortunes of the family.

Duddingstone, on the other hand, is a pleasant secluded village, formerly noted among the citizens of Edinburgh as a place for enjoying sheep-head dinners. The polished skulls of the animals were placed, it seems, as stepping-stones across the domestic pools which [illegible] in the street of a Scotch village; and hence some wag took occasion to represent it in England as a city boasting of several hundred ivory bridges. During the reign of Charles the First, the [illegible] of Duddingstone was [illegible], an extraordinary person [illegible], who [illegible] went to France, and assumed the sonorous title of Monteath of Salmonet, a name formed out of his own brain, in covert allusion to the fact of his father having been a fisherman near Stirling. This strange pretender to rank, wrote, in French, a history of the Religious Troubles in Scotland, which has been translated into English, and bears his name as "Robert Monteath of Salmonet" on the title-page. It may be worth remarking, that, in the church-yard wall at Duddingstone, near the gateway, is still to be seen a pair of jougs [from Latin *jugum*, a yoke], an instrument fitted to confine a man by the neck, and formerly used universally for the class of offences now punished in England by the stocks, but which has long been obsolete.

On clearing the high walls which shut out the view of Prestonfield Park, the ground on the right ascends to an eminence rendered picturesque and conspicuous by the ruins of Craigmillar Castle. This was a favourite out-of-town residence of the Scottish sovereigns, between the time of James the Third and that of James the Sixth. Here Queen Mary was residing when her ministers suggested her separation from Lord Darnley, which, however, was found impracticable: a few months after, he was blown into the air at the Kirk of Field. Her son, King James the Sixth, was living here when he projected the notion of his matrimonial voyage to Denmark. On the left are the beautiful groves surrounding Duddingstone House, a seat of the Marquis of Abercorn, designed by the celebrated Sir William Chambers.

A little farther forward, the country opens finely up in front, and the railway proceeds through level and highly-cultivated fields, the view being terminated by the hills of Fife and East Lothian, and the Firth of Forth. On the right, the ancient village of Niddry is seen up to the eyes in shrubbery, and surrounded by trees. On the left, at the distance of a quarter of a mile, is a cottage once occupied by the factor of the Marquis of Abercorn—an exceedingly handsome place. Some thirty years ago this house was the residence of Mr Thomas Scott, then the factor on this estate, the brother of Sir Walter, and who, in the estimation of that person, possessed abilities fit to have distinguished him in the walk of Scottish fiction. Here, in early life, Sir Walter himself often resided. To the eastward, the Leith branch of the railway parts off. Still farther to the east, is Brunstain House, an old-fashioned manor-house, embowered amidst aged trees. It was the seat of Crichton of Brunstain, who distinguished himself as one of the very first of the Scottish gentry who embraced the principles of the Reformation, and here used to afford shelter to John Knox. It has since been the fate of this house to be occupied by men of almost viceregal authority in Scotland—namely, the Duke of Lauderdale in the reign of Charles the Second, and Andrew Fletcher, Lord Milton, in that of the second George. On approaching Brunstain, the Dalkeith and Musselburgh branches are found to divide. The latter proceeds about a mile and a half down an inclined plane (descending one foot in forty) to the coast. The other stretches on towards Dalkeith, which it leaves on the left, at the distance of half a mile.—We shall, in our next article, give an account of Dalkeith Palace, which is often visited by the individuals who make pleasure-trips along the railway.

DAVIE.

It is now about a twelvemonth since the family of Mr Hope of Kelbank, in Perthshire, had occasion to pay a visit to the Continent. Of this family it is unnecessary to say more than that it consisted, while settled in Scotland, of Mr and Mrs Hope, with one son and two daughters, all grown up. On the present occasion, the son, Mr George, was entrusted with the charge of the family, as the old gentleman was obliged by business to remain at home for a time, with the intention, however, of speedily joining the rest at Rome. Mr George was an elegant and dashing young man, had spent two fashionable winters in Edinburgh, and in particular had formed an intimate acquaintance with the Baron Damas, an official in the court of Charles the Tenth, at Holyrcodhouse.

When Mrs Hope had determined upon the jaunt, she engaged a favourite female servant, by name Margaret, to accompany her abroad; and till a few days before the time appointed for setting out, nothing occurred to mar this arrangement. It was found, however, almost at the last, that Margaret had a "lad," from whom she could on no account part: good wages and foreign sights were no doubt tempting, and a bargain was a thing not to be lightly broken: but what were all these to plighted love? Margaret, in short, could not go. Mrs Hope found it impossible, in the very brief time which now remained, to engage another female servant. It occurred to her, however, as a last resource, that a certain clever little stable-boy, whom they had had for two or three years about the house, and who usually went by the familiar name of Davie, might be brushed up into a tolerably good footboy, provided he would consent to go. No sooner thought of than acted on. Davie was instantly called into the presence of his master and mistress, and asked if he had any objections to going abroad as a waiting-man, instead of remaining at home as only an attendant upon horses. The little fellow brightened at the very mention of such a thing. Objection!—Davie would go to the end of the world with his mistress—if his father and mother would only let him. Mr Hope dismissed the boy with commendations at once for his readiness, and his deference to the will of his parents, and immediately riding over the country to the place where Davie's friends resided, easily prevailed upon them to allow their son to go abroad.

Behold the family party, then, squired by Davie, setting out on their tour to the Continent.

In order that the remainder of our story should have its proper force, we must premise that Davie was essentially a Scotch village boy. He was one of those little Flibbertigibbets—to use one of Sir Walter's ideas—who are always to be seen flying about small towns in Scotland, with bare feet and fluttering attire, working all kinds of mischief against cats and poultry, fishing for eels, and tying their skins by way of trophy round their ankles, darkened by the sun to the tint of a filbert, and unconscious of any evil on earth except the Shorter Catechism. Such only, however, was Davie, previous to his being reduced to servitude under Mr Hope. He had since then been put into proper externals—had learned to do a little in the way of serving a table—could whistle the hunting-song in Der Freischutz, and even already had manifested a tendency to that jockeyish coxcombry which consists in turning the row of knee-buttons towards the front. In former times, Davie's sun-bleached hair was arranged above the brow in a curious radiating fashion, which bears in Scotland an equally curious vaccine name; but now he had learned to train it neatly forwards, after a manner approved of by various persons of his own rank and station in life—and, upon the whole, he was a fair good-looking boy, though as yet in no respect superior in natural or acquired gifts to the humble duties which it was his lot to perform.

At the French ambassador's office in London, the family obtained a general passport, which expressed that they were going to Rome on business, and in which the redoubtable Davie was of course included as their servant. Nothing particular occurred till they arrived at a hotel in Paris, when, as they were about to sit down to take some refreshment, Miss Hope happened to cast a glance through the window, and saw a troop of *gens d'armes* ranked up in front of the house. "Surely," said she, "there must be some unusually distinguished person in this hotel—see what a fine guard of honour he has at the door!" At that moment two of the said gens d'armes entered the room, with a low bow; and while one stood as erect as a poker, the other, who appeared to be the commanding-officer of the party, said very politely in French, "Sir and ladies, I am sorry to be under the necessity of informing you, that you must consider yourselves under arrest."

The astonishment of our honest Scotch friends may be conceived at this unexpected and unaccountable turn of affairs. "Under arrest!" exclaimed young Mr Hope; "for what?" "I beg your pardon, sir," answered the Frenchman; "it is suspected by the French government that you have brought the Duc de Bourdeaux in your party from Holyroodhouse. I can but do my duty, by putting you all under arrest. I think, sir, you are not all here; one of the individuals described in your passport seems to be wanting. *He* must be immediately had."

The mystery all at once flashed upon the mind of the younger Miss Hope, who exclaimed, in a transport in which mirth struggled with wonder, "George, I declare it's Davie!" "Davie!" said her brother, "what of Davie?"—for the idea was so far beyond all natural likelihood and feasibility, that he could not yet comprehend it. "Why, Davie," replied Miss Hope, "Davie is supposed to be the Duc de Bourdeaux in disguise." At this explanation, the whole party, excepting the Frenchmen, and Davie himself, who at that moment came in with a tray, burst into a fit of laughter, which hardly experienced any check even from the fear of a little temporary trouble. Davie taken for the Duc de Bourdeaux! Davie a legitimate but disinherited sovereign! Davie, who, but yesterday, was stable-boy at Kelbank, and is even at this moment, all unconscious of his honours, engaged in the humble duty of marshalling vinegar and mustard cruets! The idea was too ludicrous. It was more than the risible faculties of man could well bear; and we verily believe, that though the party had seen the muskets of the national guard levelled at them, they must still have laughed. After their merriment had passed the first burst, Mr Hope went up to the commandant, who was looking always graver and graver, and politely begged his pardon for what might appear to him as scarcely the conduct appropriate to the occasion. "I must really say, however, that the notion which the French government has formed as to our poor little waiting-boy, is so outré—so bizarre—that some little mirth is hardly avoidable."

"Pardonnez moi," said the Frenchman; "the description in the passport answers exactly to the Duc de Bourdeaux; it is known also to the French government that you, Monsieur Hope, was a visitor at Holyroodhouse. When these circumstances are taken in connection with the known intention of the ex-king to remove immediately from Scotland, it appears to me as if the probability were pretty strong."

"Well, sir," rejoined Mr Hope, "here is the boy himself; take a good look at him; examine him by question, or otherwise; show him to any person who may have seen the Duc de Bourdeaux before he left France. And if this be the illustrious personage you suspect him to be, I will be happy to submit to the consequences, however disagreeable."

Davie, who had stood for some time in a state of complete bewilderment, with a bread-knife arrested in his surprised hand, and his eye fixed alarmfully on his master (though his sensations referred rather to the gestures than the language), was now brought forward by Mr Hope, and subjected to the scrutiny of the soldiers, none of whom, however, were able to identify him.

"Comment s'appellez vous?" said the commandant, with an evident mixture of involuntary respect in what would have otherwise been the blunt question of a person in authority.

Davie only stared, for the very good reason, that he did not understand the question. His master, however, having explained to him that the gentleman

wished to know his name, the supposed duke answered, in a strong Scotch accent, "Davie Fairbairn, if it please ye, sir."

"Ah, bien," said the Frenchman, in the same tone; "et qui sont votres parens?"

This being likewise interpreted, Davie answered in all simplicity, "My father is the sutor at Collace, and my mother keeps the public."

When this was explained to the interrogator, he elevated his eyebrows with an incredulous expression, and asked if he had been long in the service of his present master.

"Ou, sir, I've been three year 'gain Martinmas wi' auld Mr Hope—I was the groom's right-hand man, sir; but now I'm promoted to wait on the leddies, and I'm gaun wi' them to Eetaly."

"Mon prince," said the commandant, with a mock obeisance, "vous avez employé bien votre temps en Ecosse. J'aperçois que vous avez appris á la perfection la langue." [My prince, you have employed your time well in Scotland—I perceive you have learned the language to perfection.]

The gravity of the family was here once more fairly overthrown, and they laughed long and loud, notwithstanding the evidently rising wrath of the two soldiers.

At length, mastering his mirth, Mr Hope proposed to go with the supposed pretender to the throne of France, otherwise called Davie Fairbairn, under a guard, to the residence of the intendant of police, where he conceived they would be sure to find some one qualified to decide the matter in question. To this the commandant consented, and they accordingly departed in a coach—Davie sitting as proud as a peacock in the back seat, between two of the soldiers, while a detachment was left to guard the ladies in the hotel. They were speedily introduced to the intendant—a very dignified looking person—who, having been informed of the case, set it at once to rest by declaring (what he had every reason to be sure of) that Davie *was not the duke.*

Mr Hope and his man were then liberated, with many polite expressions of regret, and conducted back to the hotel, under every mark of respect. The former was advised, however, when he called next day at the British ambassador's, to get a separate passport for Davie, for the rest of their journey, as the circumstances which had already marked him out for suspicion might operate elsewhere, and be productive of serious inconvenience to the family. Mr Hope obeyed this counsel; but it was found unnecessary. The story of the mistake at Paris had taken wind, and was known wherever they halted. Davie was, accordingly, treated all through France as a sort of lion—people seeming to feel a kind of interest in one who *might have turned out to be* Henry the Fifth.

A STATE OF NATURE.

While labouring under the restraints that a state of civilization imposes, we are but too apt to find fault with our condition, and, if wrought to a pitch of excitement, perhaps wish that we were well out of the trammels of society, and dwelling in peace in some remote corner of the world, where law and government were alike unknown. Feelings of this description are frequently very chimerical, and, while indulging in them, we forget that the slight troubles that affect us are the penalties paid for a state of social freedom more happy than is enjoyed by almost any people. There are few countries in the world, besides Great Britain, in which a virtuous family can sit down securely at their own cheerful fireside, with their door shut and bolted, and no dread upon their minds of disturbance or personal molestation. And who would not, to enjoy this great boon, give up a little of his individual pretensions for the good of the whole? Man is a gregarious animal; he necessarily prefers society, with all its trammelling conditions, to a life of solitude. The natural independence enjoyed by Alexander Selkirk has its charms, and captivates many a young and ardent mind; but if put to trial, it would soon lose all its zest. The dismal quietness that would prevail, the difficulties of gaining a rude subsistence, the fear of wild beasts or venomous reptiles, the frightful idea of lying in a helpless state of disease, if not dying unheeded and uncared for, form no species of allurements, and would make us exclaim, in the words of Cowper,

> "Better dwell in the midst of alarms,
> Than reign in this horrible place."

A state of natural independence among fellow-men would be much more irksome and fatal, for the strong would overpower the weak, and the artful, with impunity, would circumvent the unsuspecting. There must be order—there must be law. "A state of nature (says Doctor Wade, in his excellent History of the Middle and Working Classes), is a state of great inequality; as much so as men's abilities and physical power. It follows that it is civil, not natural liberty, which introduces equity among mankind, by making the law, not force, the shield and arbiter of right.

The natural right of a man to do as he desires, and can, supposes the same right in every other person: but the exertion of so many independent rights would often cause them to clash and destroy each other. A law that would restrain all, might be beneficial to all; because each might gain more by the limitation of the freedom of others, than he lost by the curtailment of his own. Natural liberty is the right of every one to go where he lists, without regard to his neighbour; civil liberty compels him to go on the public road, which is most convenient to himself, consistently with the enjoyment of the same convenience by other persons. The establishment of civil liberty is the enclosure of the waste, by which each surrenders his right of common, for the quiet possession and culture of a separate allotment.

The transition from the natural to the civil state, subjects man to responsibilities to which he was not before liable. In the former, he indulges his appetites, solely with reference to himself; in the latter, he can only indulge them, with reference to the society of which he is a member: and this he is bound to do, first, by the criminal restraint which the law imposes on actions of importance; and, secondly, by the moral restraint, which public opinion imposes on those of lesser degree.

As the natural was the first state of man, it may be inferred that this state would have continued, had not a persuasion arisen that social order would be more conducive to happiness. As the public good was the motive, so it must continue the end of civil society; and for this reason, that there is no obligation imposed on mankind, save their advantage, to maintain the social in preference to the individual state of existence. And upon this principle the laws of a free people are founded, namely, that they shall impose no restraints on the acts of individuals, which do not conduce in a greater degree to the general good.

Whether man has benefited by the introduction of civil society, is a moral problem, which, like other problems not mathematical, can only be solved by inferential testimony. Two reasons make strongly, and, I think, decisively in favour of the affirmative conclusion. First, mankind had their *choice*, and it is contrary to human nature to suppose that they would voluntarily have left the natural state, had not experience shown them that the social was better. Secondly, by the surrender of a portion of his natural freedom, man appears to have been well compensated by civil enjoyment. Civilization only divests man of a fraction, not the whole of his primitive liberty: all those acts that are personal to himself, he may continue to indulge in as freely as the savage, subject to no other control than public opinion, which he may defy if he pleases. The law restrains public deeds, and this it does because they are hurtful to others, not to the perpetrator only. Such restraint is civil liberty, and he who seeks greater licence, can neither be just nor rational; he can scarcely be a man, but something worse.

The establishment of civil rights entirely supersedes the operation of the natural rights, which previously governed the relation of individuals. The right of revenge, of the strong to oppress the weak, and of all those powers which are supposed to appertain to the wild justice of nature, are abrogated by the institution of society. The law is then supreme arbiter: it may be a bad law, but while it continues unrepealed, it is the sole rule, the only tribunal of resort to establish a claim, or redress an injury.

It is unnecessary to illustrate further the distinction between natural and civil liberty. The first is a chimera, like the points and lines of mathematicians; but, like them, it serves as a basis for reasoning, and enables us to deduce the real from the abstract. Alexander Selkirk might possess his natural rights in Juan Fernandez, but nobody else. Two men could not live a day on a desolate island—they could not meet at the fountain for a pitcher of water, without settling the question whether age, strength, or first comer, should have precedency; and the termination of the dispute would be the establishment of civil order between them."

THE SMUGGLERS.

> Belay there, my hearties, and ease off your crack,
> Come, heave up your anchor, make sail on your tack
> And tip us a yarn of peril and spree,
> While the grog round the table in oceans flows free,
> Brave boys!

"Och hone agra, Denis, mavourneen, is it kilt ye are? Spake to the poor ould mother that bore ye. Och, confound the villain that fetcht ye that wipe athwart yer brow; and if I catch the murtherin' thafe, I'll set my tin commands on 'im, that I will. Alas! alas! yer gon from me intirely now! Ye'll never more grasp the tiller, or rin out another reef in this world; but it's ye that shan't want a mass t' help ye in the next, tho' I should never whiff another caubeen for it; yer sowl to glory, amin. Dry your eyes, Rose, ma-colleen. Weepin' 'll do 'im no good, that lies there dead and gon." "Oh, Nancy, I can't help it when I see him stretched so, and when I think that he'll never more smile on his poor Rose, never again; but hasn't Ned gone for the doctor?" "True for ye, a cushla ma chree, he maybe's there by this, tho' I'm mightily 'fraid his life-lines are cut away, and he must be stowed under the boord like his father afore 'im. Och whirra sthrew, my poor boy! Och the blessings on yer face, docthur, avourneen, it's me that aint glad to see ye mayhap," said the old woman to the doctor, as he entered the room of the hut in which they were; and while he's doing his best to bring his patient to, we'll say a few words to our readers in explanation of the above.

The small town or fishing village of Fowlham, on the south-east part of England, was at the time of our story one of the chief and most noted haunts of the smugglers of that wild coast. The whole of the population, from their infancy up, were taught, both by precept and example, to consider the free trade as the chief and most glorious end of their lives. The house of each person was, in some manner, adapted for escape or concealment. Steps for the feet, and holds for the hands, were cut in several of the chimneys, and on the roofs several planks were always kept in readiness, to be placed from the ledge of one house to another, in order to facilitate escape, which was the more easily managed, as the streets were narrow, and the top story of each domicile jutted out in the old-fashioned style of the architecture of the time in which they were built. The floors likewise of the rooms could all be taken up, discovering large spaces, capable of holding many a bale of silk and tobacco. Among so many hardy and reckless men, there was always some one who held a kind of tacit authority over the rest, won by many a deed of skill and daring. For many years, Matthew or Big Mat Smith, as he was generally called, had been their leader. To a frame of iron, he added a mind fearless and unshrinking, and fertile in every expedient necessary to ensure success in their undertakings. He was now sinking into the "sere and yellow leaf," and the only prop of his declining days was his fair-haired, blue-eyed daughter Rose. Of five stalwart sons, not one now remained to him. Two perished in the storm—the rest fell fighting by his side. Success full often awaited on the smuggler's undertakings, and many a whisper of hoarded shot in his locker was rife in the town. 'Twas no wonder that the doctor and the apothecary thrived, for hardly a Saturday night passed without numerous broken heads; for Rose, to no small share of beauty, added more substantial charms of wealth; and this, combined with the almost certainty, that whoever was the favoured one, would in all probability succeed to the skippership of the place, caused such a flow of blood to the fingers of the free traders, that, when not busy otherwise, they were fully employed in toasting the pretty Rose, and giving each other *striking* proofs of their admiration of the "pride of Fowlham."

After much drinking, dancing, and fighting, Denis M'Carthy at last opened a pretty clear road for himself, by beating all his opponents, and lighting a little bit of a spark in Rose's breast, which he was not the boy to let go out for want of fanning; and old Mat himself saw with pleasure his child fixing on Denis for her future pilot through life—for the young Irishman had always borne himself spiritedly and well, both afloat and ashore, and had once even saved the old man's life, by flinging himself before him, and receiving the stroke of a man-of-war's cutlass intended for Mat. Denis, being young and of a hardy constitution, soon recovered, and became prime favourite with his Rose's father. "'Tis mighty odd intirely," said his mother to him, one night as they sat croonin' over their bright fire and clean wiped hearth, "what confidence that same thafe, love, puts into the most fearful little colleen of us all. Faix, not more nor a month agon', there was that same Rose couldn't lift up her eyes from the grund, and ax a crathur, 'How d'ye do?' but now she'll go hangin' on yer oxter the whole day, an' look into your face, too, as bold as brass. The blessin's on her! Och, but ye're the boy for 'em, Deny alanna!"

Nancy and her husband had left Ireland soon after they were married, and after being tossed here and there, at last came to anchor for good at Fowlham. M'Carthy soon joined the smugglers, and plied his dangerous and illegal vocation with the greatest assiduity. Working away thus, he managed to get on pretty well for about three years, when, one fine moonlight night, as he was pacing the deck of the "Speed," which was going at a glorious rate before the wind, with the spray dashing like falling snow over her bows, he was met by a leaden messenger from a cruizer, which ran across their bows, and which just gave him time to exclaim, "Very unjontlemanly behaver this," when death stept in, and cut his soliloquy short. Nancy was now left "a poor lone widy on the wide world, wid a poor faderless bit of a gossoon to provide for;" and nobly she did her duty towards her orphan boy. Many a cruise did Nancy take "wid the boys," and many a run did she lend a by no means useless hand in, till at last "ould Nancy was well to do, plase God, and thrivin'." Such was the state of affairs on the morning of the day on which our story commences.

The pier, the harbour, the town, and all the manifold objects therein, had just begun to emerge from the dim obscurity of night, and to stand broad out in the rays of the rising moon, which, kissing the crests of the dancing waves, glanced on and illumined with one blaze of purple light the eternal cliffs, and gradually faded away into the distant sea, showing, in one *coup d'œil*, the grand superiority of nature over the works of the sojourners of earth. From every house, street, and alley, the people now began to issue, hurrying fast to the pier. Mat Smith's beautiful new schooner, the "Rose," was that morning to make her first trip. All was ready on board for sailing, and nought delayed her but the absence of Denis and the skipper. On all sides cries of approbation and delight arose. "What a tight little hooker! What a clean run along the bends; and then her yards and spars so all a taunto! If she don't take the conceit out

o' the king's men, why, I'm mistaken, that's all. Here they come! here they come!—Good luck attend you, Mat, 'tis you that's the glory of us! Ah, Denis, I give you joy; here's success to you, my lad." Many more uproarious congratulations of the same sort followed the Rose, even till she was far out of the harbour. Night came on, and found her about eleven knots to the southward of Fowlham. The opposite coast had been made, and the run as yet had been quite successful. Mass after mass of fleecy clouds flitted across the moon, their edges rendered luminous as they came within the influence of her rays. The wind was fast lulling, and the gentle undulating motion of the water scarce rippled against the sides of the schooner as she lay in the bight of a small bay about three hundred yards from the shore, casting her huge shadow to the foot of the hoary cliffs themselves. The stillness of the scene added greatly to its beauty. On her starboard side stretched the sea in its broad expanse to the gay shores of France. One sheet of radiance tapering from the extreme verge of the horizon, and gradually extending itself into one broad mellow light, fell across it, till it was stopped by the schooner, looking as she lay, her sides all silvered with the glowing beams, "the forest queen of the deep." On the larboard rose a high range of cliffs, which girt in almost the whole of the coast. Here and there some twinkling lights shone in the distance, marking the place where stood some lowly hamlet, or more lordly tower. "I say, Denis, my hearty," began Mat, soon after the schooner took up the berth we have described, "I can't say as how I feel particularly pleasant this 'ere night, like as if somethin' had ta'en me quite aback, and almost, as it were, cut my life-lines adrift. Some harm 'll lay us aboard, I'm thinkin'. I wish those lubberly shore haulers would bear in sight, and we'd this cargo safe stowed, and us alongside o' Rose snug moored by a blazer, with a prime in our mauleys—eh, boy?" "Can't say as how, Mat, but that 'ere prime wouldn't be after being mighty agraable, or I'm thunderstruck—But what a't keeping them shore-goin' spalpeens? Thunder an' turf, no one han't turned the snitch, an' peached—eh, Mat?" "Hope not, boy; but there's the signal! Stir about, every mother's son of ye!"

The signal had been made from the shore that the party there were ready for the cargo, and for starting, and in a few moments they were all standing on the edge of the shore, prepared for their share of the business. A number of strong roadsters stood by, ready to be off to the interior as soon as they were loaded. Most of the group were armed with some weapon or another, chiefly of a rustic kind. "Here, Neptune, here," shouted one who acted as leader of the land party; and a fine large Newfoundland dog, with a rope attached to his collar, bounded into the water, and swam straight for the schooner. A number of kegs and bales, well fastened and tarred to prevent the water getting in, were fastened to it, and immediately drawn ashore. The dog made two or three trips, and a great quantity of goods were thus landed. The ship's boats in the meantime were not idle, and, in an incredibly short time, the whole of the cargo, and Mat and Denis, were safely landed, and the schooner then stood out to sea. Six of the best armed men mounted, and took up their position in front, as the avant-guard. Mat, Denis, and four more, formed the rear. The rest, with the cargo, were in the centre. The word was given to advance, and the party were just in motion, when the look-out, who was stationed up the glen, through which they had to pass, came running in at the top of his speed, roaring out, "The officers are on us, and the soldiers with 'em!" No time was to be lost. "Away with ye, every one!" exclaimed Mat and Denis together, "away!" And in a moment the whole were flying in every direction, still, however, retaining a hold of their loads, with the exception of our two friends, and the ten men with them, all bold and resolute fellows, and determined to the last to cover the retreat of their goods. In cases like this, when the free traders were met by the officers of the preventive service, they were accustomed to separate, and by the thousand cross roads and hill-paths, to make the appointed place of rendezvous, which was always previously agreed upon. Thus, though a few might be taken, still the greater part escaped with the share of the run assigned to them. As the flying party disappeared one by one, in different directions, the picked, or head men, moved steadily onward. On reaching the mouth of the glen, they were stopped by about twenty man-of-war's men, ranged in line, and commanding the passage. "On, my lads, on for your own sakes!" cried Mat, putting spurs to his horse, and galloping forwards, followed close by his men. On they went, and the pistols of the king's men were discharged in a volley, but, owing to the moon that instant having veiled her light behind a dark cloud, the shots passed harmlessly over their heads, and before the smoke could clear away, horse and men were mixed together in the *melée*. Wild shouts, and execrations in every shape, now flew fast and furious. The smugglers seldom, if they could help it, used their fire-arms, and consequently they were always at it hand to hand, tooth and nail. The kicking and plunging of the horses soon bore fright and dismay among the officers of the law. They began to waver, and Denis, that moment rising in his stirrups to make a cut, sung out with the whole force of his Stentorian lungs, "Give it 'em, my jewels! At 'em, my Roses!" He said no more, for a back-handed stroke of one of his antagonists that instant brought him to the ground.

When the dawning light of sense and perception returned and resumed her wonted seat, Denis found himself in the house of Smith, with Rose holding one hand, and his mother kissing and crying over the other. "Och, hubbabo! mother, what's the row? What are you afther, keenin' over me that way for, agra?" "Och, Denis, avourneen, a cushla machree, a lanna, hould yer tongue, and don't spake, for the docthur says ye'll kill yerself if ye do so. Aisy now, dear, and Rose, the darlin', 'll till ye all about it; eternal blessin's rest on her and hers, for it wasn't her maybe that watched ye all alongst!" The free traders had been triumphant. Denis was carefully raised up, the cutlass-cut across his brow bound up, and he was then carried to Mat's house in a state of insensibility. The operation for trephine was performed upon him, and for a month he was delirious. He then recovered, and, to use his own expression, "bore up from the lee-shore of sickness, with every sail he could crowd, for the port of health and matrimony." A short time after, Rose and Denis became one. And it is gratifying to state, that Rose had sufficient influence over her husband and father to prevail on them not again to attempt the perils of the smuggling profession, which, independent of its dangers and degrading character, in general, sooner or later, brings ruin on its followers.*

STORY OF THE COUNTESS OF STAIR.

[From Reekiana, by Robert Chambers.]

In a mean and narrow alley leading from the head of the Earthen Mound to the Lawnmarket, Edinburgh, is an ancient house, once inhabited by the dowager of the celebrated general and statesman, John, second Earl of Stair, who died in 1747. Her ladyship, after long exercising a sway over the *haut ton* of the Scottish capital, died here, November 21, 1759, at a very advanced age. The late Mr Mackenzie, author of the "Man of Feeling," informed the author that he recollected her ladyship living in this house. The close takes its name from her ladyship. Some remarkable circumstances in the early life of this lady formed the groundwork of a tale by the author of Waverley, under the title of "Aunt Margaret's Mirror." They are now related here in a more ample form. She was the youngest daughter of James, second Earl of Loudon, and consequently was granddaughter to that stern old earl who acted so important a part in the affairs of the covenant, and who was Lord Chancellor of Scotland during the troublous times of the civil war. While very young (about the beginning of the eighteenth century), she was married to James, first Viscount Primrose, a nobleman of extremely bad temper, and, what was worse, of very dissolute character. Her ladyship, who had a great deal of her grandfather in her, could have managed most men with great ease, by dint of superior intellect and force of character; but the cruelty of Lord Primrose was too much for her. He treated her so barbarously, that she had even occasion to apprehend that he would some day put an end to her life. One morning, during the time she was labouring under this dreadful anticipation, she was dressing herself in her chamber, near an open window, when his lordship entered the room behind her with a sword drawn in his hand. He had opened the door softly, and although his face indicated a resolution of the most horrible nature, he still had the presence of mind to approach her with the utmost caution. Had she not caught a glimpse of his face and figure in her glass, he would in all probability have approached her near enough to execute his bloody purpose, before she was aware, or could have taken any measures to save herself. Fortunately, she perceived him in time to leap out of the open window into the street. Half dressed as she was, she immediately, by a very laudable exertion of her natural good sense, went to the house of Lord Primrose's mother, where she told her story, and demanded protection. That protection was at once extended; and it being now thought vain to attempt a reconciliation, they never afterwards lived together. Lord Primrose soon afterwards went abroad. During his absence, a foreign conjuror or fortune-teller came to Edinburgh, professing, among many other wonderful accomplishments, to be able to inform any person of the present condition or situation of any other person, at whatever distance, in whom the applicant might be interested. Lady Primrose, who had lost all trace of her husband, was incited by curiosity to go, with a female friend, to the lodgings of this person in the Canongate, for the purpose of inquiring regarding his motions. It was at night; and the two ladies went, with the tartan screens or plaids of their servants drawn over their faces by way of disguise. Lady Primrose having described the individual in whose fate she was interested, and having expressed a desire to know what he was at present doing, the conjuror led her to a large mirror, in which she distinctly perceived the appearance of the inside of a church, with a marriage party arranged near the altar. To her infinite astonishment, she recognised in the shadowy bridegroom no other than her husband Lord Primrose. The magical scene thus so strangely displayed was not exactly like a picture; or if so, it was rather like the live pictures of the stage, than the dead and immovable delineations of the pencil. It admitted of additions to the persons represented, and of a progress of action. As the lady gazed on it, the ceremonial of the marriage seemed to proceed. The necessary arrangements had, at last, been all made; the priest seemed to have pronounced the preliminary service; he was just on the point of bidding the bride and bridegroom join hands; when suddenly a gentleman, for whom the rest seemed to have waited a considerable time, and in whom Lady Primrose thought she recognised a brother of her own then abroad, entered the church, and made hurriedly towards the party. The aspect of this person was at first only that of a friend, who had been invited to attend the ceremony, and who had come too late; but as he advanced to the party, the expression of his countenance and figure was altered very considerably. He stopped short; his face assumed a wrathful expression; he drew his sword, and rushed up to the bridegroom, who also drew his weapon. The whole scene then became quite tumultuous and indistinct, and almost immediately after vanished entirely away. When Lady Primrose got home, she wrote a minute narrative of the whole transaction, to which she appended the day of the month on which she had seen the mysterious vision. This narrative she sealed up in the presence of a witness, and then deposited it in one of her drawers. Soon afterwards, her brother returned from his travels, and came to visit her. She asked if, in the course of his wanderings, he happened to see or hear any thing of Lord Primrose. The young man only answered by saying, that he wished he might never again hear the name of that detested personage mentioned. Lady Primrose, however, questioned him so closely, that he at last confessed having met his lordship, and that under very strange circumstances. Having spent some time at one of the Dutch cities—it was either Amsterdam or Rotterdam—he had become acquainted with a rich merchant, who had a very beautiful daughter, his only child, and the heiress of his enormous fortune. One day his friend, the merchant, informed him that his daughter was about to be married to a Scottish gentleman, who had lately come to reside there. The nuptials were to take place in the course of a few days; and as he was a countryman of the bridegroom, he was invited to the wedding. He went accordingly, was a little too late for the commencement of the ceremony, but, fortunately, came in time to prevent the union of an amiable young lady to the greatest monster alive in human shape, his own brother-in-law, Lord Primrose! Although Lady Primrose had proved her willingness to believe in the magical delineations of the mirror by writing down an account of them, yet she was so much surprised and confounded by discovering them to be consistent with fact, that she almost fainted away. Something, however, yet remained to be ascertained. Did Lord Primrose's attempted marriage take place exactly at the same time with her visit to the conjuror? To certify this, she asked her brother on what day the circumstance which he related took place. Having been informed, she took out her key, and requested him to go to her chamber, to open a drawer which she described, and to bring her a sealed packet which he would find in that drawer. He did as he was desired, when, the packet being opened, it was discovered that Lady Primrose had seen the shadowy representation of her husband's abortive nuptials on the very evening they were transacted in reality.*

Lord Primrose died in 1706, leaving a widow, who could scarcely be expected to mourn for him. She was still a young and beautiful woman, and might have procured her choice among twenty better matches. Such, however, was the idea she had formed of the married state from her first husband, that she made a resolution never again to become a wife. She kept her resolution for many years, and probably would have done so till the day of her death, but for a very singular circumstance. The celebrated Earl of Stair, who resided in Edinburgh during the greater part of twenty years, which he spent in retirement from all official employments, fell deeply in love with her ladyship, and earnestly sued for her hand. If she could have relented in favour of any man, it would have been in favour of one who had acquired so much public honour, and who possessed so much private worth. But she declared to him also her resolution of remaining unmarried. In his desperation, he resolved upon an expedient by which he might obviate her scruples, but which certainly marks the age as one of little delicacy. By dint of bribes to her domestics, he got himself insinuated, over night, into a small room in her ladyship's house, where she used to say her prayers every morning, and the window of which looked out upon the principal street of the city. At this window, when the morning was a little advanced, he showed himself, *en déshabillé*, to the people passing along the street; an exhibition which threatened to have such a fatal effect upon her ladyship's reputation, that she saw fit to accept of him for a husband.

She was more happy as Countess of Stair than she had been as Lady Primrose. Yet her new husband had one failing, which occasioned her much and frequent uneasiness. Like all other gentlemen at that period, he sometimes indulged too much in the bottle.

* From the East Lothian Journal.

* This story is given as it is said to have occurred: yet tradition may have lent it a colouring favourable to the idea of supernatural agency; and something must likewise be allowed for the excited feelings of the lady, as well as the artifices generally practised by pretended conjurors.—*Ed.*

When elevated with liquor, his temper, contrary to the general case, was by no means improved. Thus, on his reaching home, after any little debauch, he generally had a quarrel with his wife, and sometimes even treated her person with violence. On one particular occasion, when quite transported beyond the bounds of reason, he gave her so severe a blow upon the upper part of the face, as to occasion the effusion of blood. He immediately after fell asleep, altogether unconscious of what he had done. Lady Stair was so completely overwhelmed by a tumult of bitter and poignant feeling, that she made no attempt to bind up her wound. She sat down on a sofa near her torpid husband, and wept and bled till morning. When his lordship awoke, and perceived her dishevelled and bloody figure, he was surprised to the last degree, and eagerly inquired how she came to be in such an unusual condition? She answered by detailing to him the whole history of his conduct on the preceding evening, which stung him so deeply with regret—for he was a nobleman of the most generous feelings—that he instantly vowed to his wife never afterwards to take any species of drink, except what was first passed through her hands. This vow he kept most scrupulously till the day of his death. He never afterwards sat in any convivial company where his lady could not attend to sanction his potations with her permission. Whenever he gave any entertainment, she always sat next him and filled his wine, till it was necessary for her to retire; after which, he drank only from a certain quantity which she had first laid aside.

The Earl of Stair died in the year 1747 (at Queensberry House, in the Canongate, Edinburgh), leaving her ladyship again a widow.

DRAUGHTS AND DEATHS.

Many old people, as well as persons in middle life, in this country, are subject to rheumatism, a species of pain or disease, which, like the toothach, meets with little general sympathy, because it is not frequently immediately fatal in its attacks. In the case of many who belong to professions where exposure to atmospheric changes from heat to cold, and dry to wet, necessarily takes place, it is almost impossible to prevent rheumatism occasionally taking effect; but in not a few instances this painful malady might be avoided, simply by being a little more careful of our persons. There are some people, who, because they are stout and healthy, and have good appetites, and have hardly ever been ill all their days, think that they may do any thing with themselves, and therefore cherish the dangerous idea, that "they will not kill." Whenever we see people of this description, we are afraid of them. We know, from experience, that it is they who have the chance of being cut off first among our acquaintances, and so look upon them as persons, who, braving death at every corner, will some day soon be numbered with the dead. On the other hand, we have never any fears for the man who is always complaining of something trifling being the matter with him; for we know that he takes good care of himself, and, like a creaking hinge, he will endure a great deal before he parts with existence. People of this sort are dreadfully jealous of an open window, or a broken pane of glass, or a door standing ajar, and well they may, for it is at these holes that rheumatisms, colds, coughs, consumptions, and deaths, get admittance, and surprise the inmates. There may be often something ludicrous in the fears excited by seeing the openings in windows and doors which we mention; but we would advise all who prefer good to bad health, and a warm bed to a place in the churchyard, to submit to any kind of ridicule, rather than sit down in a room, a church, a coach, or any other place in which there is a draught of air playing about, and seeking whom it may devour. If they be wise, they will either see the opening which causes the said draught, closed, or at once make good their retreat. Better to leave the company, and all its fascinations, sound in lith and limb, than have the chance of retiring with at least a rheumatic pain in the shoulder, which sticks to you for years, and seems as if you were perpetually enduring the cut of an axe or the boring of an awl in your flesh and bones.

We are convinced that many young persons literally kill themselves out of mere carelessness and bravado. We have a distinct remembrance of a fine, tall, stout, gentlemanly man of our acquaintance, thus committing a suicide. He measured six feet three inches in height, was well built in body; and when he shook any one by the hand, it was like the grip of a vice. He was a true Hercules in frame; and on looking at him as he paced along the pavement with graceful ease and stateliness, you would have been inclined to say, there goes a man who will live many years: death will find it no easy matter to bring him down. Such a fallacy! We saw him one fine sunshiny day walking on Prince's Street, and none could be compared with him in point of appearance; people turned about and looked at him as he passed. Six days elapsed, and he was lying in his grave. Some business or pleasure had called him a short distance into the country. In coming back, he had missed the stage which he expected would convey him back to town. But this was no disappointment; he was fond of a journey on foot; what was a few miles to him? So he walked home, and overheated himself; took off his shoes, and sat for a few minutes in a draught before an open window. In an instant of time he caught his death. A short cough: a creeping cold all over the body: inflammation in the breast, or lungs—it is all one: the doctor: bleeding: high fever: death: the undertaker: funeral letters: and the churchyard. Such was the routine of destruction in the case of perhaps the handsomest man that ever walked on the streets of Edinburgh. Will his example serve as a warning?

We are ever complaining of being affected with colds, and coughs, and rheumatisms, and other diseases; yet we seem to take little care in preventing their intrusion. One-half of the deaths which occur are brought about by our own follies, or our own carelessness. Because we are well, we think we shall never be ill. We go out to evening parties without greatcoats, or cloaks, or something warm to wrap round our mouths and necks in coming home. We come out of theatres heated to the suffocating height of eighty and ninety degrees, and plunge into an atmosphere almost at the freezing point, and that without a fear of the consequences. We are also criminally careless about the state of our feet. We walk about in wet weather, and come home with damp shoes or boots—will not be at the least pains to change them for others which are dry and comfortable. Of course, colds and coughs ensue; perhaps, also, we procure ourselves some smart twinges in the stomach, and administering a dram by way of antidote, probably hasten an incipient inflammation to its crisis. There is not one of our readers who cannot recal instances of deaths among his acquaintances, caused in this or a similar manner.

TO THE LILY OF THE VALLEY.

Fair flow'r, that lipt in lowly glade
Dost hide beneath the green'wood shade,
Than whom the vernal gale
None fairer wakes on bank or spray,
Our England's lily of the May,
Our lily of the vale.

Art thou that "Lily of the field,"
Which, when the Saviour sought to shield
The heart from blank despair,
He show'd to our mistrustful kind,
An emblem to the thoughtful mind
Of God's paternal care?

Not thus I trow: for brighter shine
To the warm skies of Palestine
Those children of the east.—
There, when mild autumn's early rain
Descends on parched Esdrelon's plain,
And Tabor's oak-girt crest—

More frequent than the host of night,
Those earth-born stars, as sages write,
Their brilliant disks unfold;
Fit symbol of imperial state
Their sceptre-seeming forms elate,
And crowns of burnish'd gold.

But not the less, sweet springtide's flower,
Dost thou display the Maker's power,
His skill and handy work,
Our western valley's humbler child;
Where in green nook of woodland wild
Thy modest blossoms lurk.

What though nor care nor art be thine,
The loom to ply, the thread to twine;
Yet, born to bloom and fade,
Thee, too, a lovelier robe arrays,
Than e'er in Israel's brightest days
Her wealthiest king array'd.

Of thy twin leaves th' embowered screen
Which wraps thee in thy shroud of green;
Thy Eden-breathing smell;
Thy arch'd and purple-vested stem,
Whence pendant many a pearly gem,
Displays a milk-white bell;

Instinct with life thy fibrous root,
Which sends from earth th' ascending shoot,
As rising from the dead,
And fills thy veins with verdant juice,
Charg'd thy fair blossoms to produce,
And berries scarlet red;

The triple cell, the twofold seed,
A ceaseless treasure-house decreed,
Whence aye thy race may grow,
As from creation they have grown,
While spring shall weave her flowery crown,
Or vernal breezes blow:—

Who forms thee thus with unseen hand
Who at creation gave command,
And will'd thee thus to be,
And keeps thee still in being thro'
Age after age revolving, who
But the Great God is He?

Omnipotent to work his will;
Wise, who contrives each part to fill
The post to each assign'd;
Still provident, with sleepless care
To keep; to make the sweet and fair
For man's enjoyment, kind!

"There is no God," the senseless say:—
"O God, why cast'st thou us away?"
Of feeble faith and frail
The mourner breathes his anxious thought—
By thee a better lesson taught,
Sweet lily of the vale.

Yes! He who made and fosters thee,
In reason's eye perforce must be
Of majesty divine;
Nor deems she that his guardian care
Will He in man's support forbear,
Who thus provides for thine.

MOUNT CARMEL.

No part of the promised land creates a deeper interest in the traveller than the rich and extensive bosom of Mount Carmel; while barrenness spreads on every side, and the curse of the withered soil is felt on hill, valley, and shore, this beautiful mountain seems to retain its ancient "excellency" of flowers, trees, and a perpetual verdure. The scenes in its interior are often bold and romantic in the highest degree; deep and verdant precipices descending into lonely glens, through which a rivulet is seen dashing wildly: the shepherd and his flock on the long grassy slopes, that afford at present as rich pasture ground as in the days when Nabal fed his numerous herds in Carmel. There is indeed a character peculiarly pastoral about the scenery; few grey and naked rocks, or sublime but useless cliffs, are here, as in the mountain of the Temptation, or on Pisgah. And this fertility and vivid verdure, on so sultry a soil, is deeply welcome and refreshing; more especially so the woods that wave over the summit and sides. It is beautiful to stand beneath their shelter on the brink of the mount, and look far on every side, where nought but a forsaken and shadowless land meets the eye. On the banks of the "ancient river," on which "the strength of the mighty" was broken, and the power of Sisera swept away, no solitary tree spreads its shade; the stream rolls between its green and naked shores; these are so low that the river overflows to some extent on each side during the rainy season, and is so deep and rapid as not to be fordable. It was most probably during this season that the army of Sisera, in its flight, was in part destroyed by the waters, for in its usual narrow course the stream is not of sufficient width and power to be dangerous. Just above, on the side of Carmel, is the spot pointed out by tradition as having been the scene of Elijah's slaying the prophets of Baal. There is much of the picturesque about the place; the soil is strewed with several masses of grey stone, around which are many fine trees. It is a pleasing and lonely spot, such as the imagination would hardly have selected for so ruthless yet necessary a deed. But if tradition should err here, there can be no illusion with respect to the scene of the memorable descent of the fire from heaven. When "all Israel was gathered together unto Carmel," it was clearly on this side the mountain, where it descends gradually into the noble plain beneath. The spot was finely chosen by the prophet for the spectacle of his sacrifice: since the multitude of people, coming from the regions of Samaria, might stand with perfect convenience in the splendid and open area of Esdraelon, which is here terminated at the foot of Carmel. The declivity of the mountain, its brink dark with woods, and its sides covered with the richest pasture, looks over a vast extent of country on every side. What a noble subject would this be for a painter! It was an impressive spot, from which we turned with regret, as the fading light warned us to depart.—*Carne's Travels*

WAGES AND PRICES IN CANADA

In a letter from a young man, an emigrant, at Kingston, Upper Canada, to his friends in this country, and partly printed in the *Inverness Courier*, the following observations occur on the wages of tradesmen:—"Tradesmen of all descriptions, if steady, do remarkably well here. Joiners have 5s. a-day; masons rather more; shoes are to be had at about the same price as at home, but are of inferior quality. The leather is manufactured in the province, and the shoemaker charges from 5s. to 6s. per pair for his workmanship. Blacksmiths are much in request, and may do well. Coopers are also much wanted, owing to the number of casks used in exporting flour, potash, &c. Tailors charge from 20s. to 30s. for making a good coat, and 6s. 3d. for a common pair of trousers. In harvest, labourers' wages are high; the harvest comes on very rapid, and it is difficult to procure hands. Nearly all the tradesmen, however, are slothful, and addicted to drinking, so that they derive but little good from the excellence of their wages.—The merchants of Canada are a busy, bustling race. They buy all kinds of grain, and pay the farmer partly in commodities. The lumber trade is a speculative business; it is truly astonishing to see the quantity of timber that is floated down the river, even from York to Quebec, a distance of nearly 600 miles. Some of the rafts would cover an acre of ground, being three or four logs in height, and each perhaps two feet square. Hardwood sells at Quebec at a shilling the cubic foot. This is a money-making trade when the rafts arrive safe and speedy; but in cases of accident and long detention, total ruin frequently ensues. On commodities imported from Britain, such as linens, cottons cloths, prints, cambrics, &c., the retailers have at least 50 per cent. profit—a pretty fair allowance in all conscience."

MAKERS AND SPENDERS.

FOURTH ARTICLE.

THERE is yet another class of spenders worthy of our attention. It is composed of those individuals, who, on an unforeseen reduction of their circumstances, prefer picking up a miserable subsistence by a dependence on friends and acquaintances, to earning the means of honest living, by engaging in employment below what they imagine to be the standard of gentility.

Undeserved reduction of circumstances is one of the most respectable of all things, and it will always gain respect in the local circle where it is known. Many misfortunes, however, which are called undeserved, are only called so by the sufferers themselves, through a principle of self-love blinding them to the real causes, or by persons who fear they may, deservedly or undeservedly, come to the same pass, and thus, in pleading for pity to others, only ask it by anticipation for themselves. Even where a reduction of circumstances takes place through guiltless misfortune, it is the first duty of the individuals to adapt themselves at once to their new position—to lay themselves out for the best employment, *however humble*, which they have a feasible chance of reaching, or of managing successfully—and to reduce their wants, whatever may be the immediate hardship, to the standard of that new employment. Those who, after their misfortunes, continue to live as well as ever, if they only can obtain the means through credit, are guilty of a great crime, the punishment of which will sooner or later overtake them: they will then find that the original misfortune was nothing to the new ones which their imprudence has permitted to follow. Notwithstanding, however, all the evils threatened to him who will not labour, there are many persons who do not seem accessible to a sense of what reduced circumstances demand of them. With a meanness beyond all expression, they will keep up the *appearance of their former rank* at the expense of all its *real dignity*—will borrow, beg, and incur undischargeable debt in all directions, and thus lay themselves open to the contempt and execration of thousands of individuals, rather than, by taking up the next best course of honest industry, make an open confession of their decayed circumstances, which, after all, it is ten chances to one the world is already acquainted with. Families thus sometimes live for years, in what appears a genteel manner—that is to say, occupy a good house, and generally wear decent clothes—and yet are maintained chiefly by the charity of their own original acquaintances, or by debt incurred without the least prospect or intention of payment; educating their children, too, for learned professions! which they can only accomplish by working upon the pity of all kinds of instructors; a system of mendicancy only differing from the most common that is practised, in so far as it is carried on under the respectable appearance of a desire of knowledge and of advancement in the world. In reality, all bounties that we accept from persons upon whom we have no claim, are of a mean character; for if it were established that the child of a poor person is entitled to gratuitous instruction, why not to any other of the advantages usually bought with money—and why are the honest and independent poor left without these advantages? No, no; there is no right or certain principle in the world, but that every one must labour for himself in the way his faculties and capital best admit of, taking of course all the chances of the particular walk of life which he thus assumes. If he do not thus labour, and accommodate himself to his reduced circumstances, then he and his family—no matter how they are connected, no matter how fashionable they were, and would still wish to be—are a drag upon society, and liable to be ranked among the most contemptible classes of spenders.

We sincerely wish that we could, by these observations, give a new turn to the minds of those persons who are reduced by misfortunes, yet who will not accommodate themselves to their reduced circumstances. Abstractly, there is nothing disgraceful in poverty. It may be, as it frequently has been, the lot of the most wealthy as well as the most dignified. And how noble is it for a man to combat such a misfortune!—how worthy of admiration is the spectacle of an honest and unfortunate individual bearing up under his griefs, and by his own manful exertions relieving himself from the difficulties which surround him!—how far superior, in the estimation of the right-thinking part of mankind, is such conduct to that of him who, coward-like, falls behind in the onward march of society, and suffers himself to be fed by the hand of charity, and trampled at last under foot! It behoves every one, more especially every head of a family, to bear these things in remembrance. As soon as misfortune and poverty overtake him, and when every creditable effort he has made to restore himself to his original situation has failed, let him lose no time in endeavouring to gain a subsistence by an employment below the standard he has been accustomed to. If the exercise of his genius fail, what hinders him from resorting to his physical capacities for support? It is no disparagement for the man who has all his days wielded a palette or a pen, to take up a pick-axe or a shovel: it is at least more respectable than to assume the tone and character of a "gentle beggar." At the same time, he will take care that his family act a part becoming their altered circumstances. Those who were born to be served must now serve others, for in servitude there is nothing degrading to right principle, and the rags of decayed gentility will be well exchanged for the substantial garments congenial to a lowly situation.

It is astonishing how soon a family reduced in circumstances will triumph over their misfortunes, and regain something like their former footing, by pursuing the course we point out. The industry they exert, when governed by intelligence, will in general gain a superiority over that kind of stolid labour which is alike destitute of ambition and genius. Besides, a previous good name has advantages which cannot be overlooked; many will most likely strive to assist those who seem so willing to help themselves, while they would neglect, or hold in contempt, those who wanted both the heart and the hand for exertion.

Our heart glows with no small degree of pride when we reflect on the conduct of many individuals, particularly mothers of families in Scotland, who, on a reduction of their circumstances by the death of their husbands, or otherwise, submit with resignation to their humiliated condition, and enter upon occupations more suited to their necessities than either their birth or their feelings. The virtuous struggles which many poor widowed gentlewomen thus make to rear their families, and render them useful members of society, are an honour not only to themselves, but to human nature. They are assuredly entitled to a place in the honoured ranks of *Makers*, and may be permitted to look down with pity on the widely-ramified, and frequently vicious, class of *Spenders*. And who will say that a blessing is withheld from the endeavours of all such meritorious individuals? Their names do not perish off the earth, but are held in esteem by all who know them; and their families, if endowed with the principles of integrity, self-denial, and industry, are almost sure of at length reaching that exalted station in society, which, without having been purified by their trials, they would in all likelihood never have attained.

SCOTTISH STREAMS.

THE TWEED.

What beauties does Flora disclose!
How sweet are her smiles upon Tweed!

CRAWFORD.

THE vale through which the Tweed flows, and its accessory glens, comprehending four counties, form by far the most interesting portion of Scotland, in respect of poetical, if not also of historical association. This delightful region, which has been from time immemorial the subject and the birth-place of song, and almost every foot of which may be termed classic ground, is indeed the very Arcadia of Scotland. It is the land of Learmont and Thomson, of Leyden and Scott.

The Vale of Tweed, forming the south-eastern limit of the kingdom, comprises the greater part of the district called the Border, so justly celebrated for the martial character of its people. Ever forming, in the language of their most illustrious minstrel, "the first wave of the torrent" poured by our sovereigns into England, and kept perpetually in arms by the corresponding aggressions of their enemies, the inhabitants of this district necessarily exhibited in former times all the features of chivalry. The country at this latter day contains innumerable relics of military antiquities; and, the times of war having been here, as elsewhere, succeeded by "*piping* times of peace," it abounds no less in the remains of a romantic description of poetry, commemorating the marvellous events and deeds of noble daring, peculiar to that period of warlike glory.

Two centuries of domestic tranquillity have now permitted the plough-share of the husbandman and the pipe of the shepherd to take the place of sword and trumpet. The Vale of Tweed has in that time obtained as great distinction by the arts of peace, as it won of old in those of war. The culture of its plains has afforded an example of skill and success to the rest of Scotland; while the gentle lyrics of Cowdenknowes and Traquair, breathing the pure quiet spirit of pastoral love, have acquired a fame as good as the savage ballads of Otterbourne and Yarrow.

The Tweed is held as the fourth of Scottish rivers, ranking after the Tay, the Forth, and the Clyde. It is a river of greater fame than perhaps any of its brethren, on account of its dividing, at the lower part of its course, the two sections of the island. It performs this office for a space of only about twenty out of a hundred miles; but as this is the principal point of communication between the two kingdoms, and the boundary is nowhere else so distinct, it has been assumed by a licence of common speech as indicating the separation in general, so that "both sides of the Tweed" is a phrase equivalent to the names of the two kingdoms.

The upper sources of this beautiful and classic stream are found in the parish of Tweedsmuir, Peeblesshire, and in the lofty range of hilly territory, from the opposite side of which flow the slender rivulets which form the commencement of the rivers Annan and Clyde. A small fountain, usually considered "the head of Tweed," at the base of a hill called Tweed's Cross, and named *Tweed's Well*, gives forth a small rivulet, which flows in a north-easterly direction through the parish of Tweedsmuir, receiving on each side various tributary streams. Leaving this district, the Tweed proceeds as a boundary betwixt the parish of Glenholm and Drummelzier, and, after intersecting

Stobo parish at its north-eastern corner, joins its waters with the Lyne—a stream, by the way, equally entitled to be considered "the head of Tweed"—which rises on the borders of Edinburghshire, and is increased in its course by the Tarth, a sluggish little water, from the confines of Lanarkshire. From a north-easterly direction, the river, now greatly enlarged, bends to an easterly course, which it afterwards, with few exceptions, maintains.

Four miles below its junction with the Lyne, the Tweed receives the Manor water, from a minor pastoral vale on its south bank. Here the banks of the stream become romantic and full of interest. The grounds rise with a rapid acclivity on either side, forming one of the chief passes betwixt the upper and lower country; and the ancient baronial fortlet, Nidpath Castle, once the residence of Simon Frazer, the distinguished Scottish patriot during the wars of Bruce, rises on the summit of a rocky knoll on the left bank of the stream. Sweeping round the base of this grey and romantic ruin, the Tweed, at the distance of a mile eastward, passes the neat little burgh town of Peebles, which is most agreeably situated on its north bank, in the midst of an amphitheatre of wild brown hills.

At Peebles, the Tweed receives the Eddleston water, and, at the distance of six miles farther to the east, is increased by the waters of the Leithen on its left, and those of the Quair on its right bank, both pretty sparkling rivulets, and proceeding out of vales consecrated by the Scottish muse. The Tweed soon after enters Selkirkshire, and for some miles is lost amidst a wild hilly district, from which it emerges at the Yair, whose banks have been sung by Thomson. Leaving the inclosures of Yair, the Tweed approaches the vale of Melrose, a rich and flat piece of territory, lying like a luxuriant garden in the midst of a wilderness, ornamented with the venerable ruins of Melrose Abbey, and on the south overhung by the dark towering peaks of the Eildons—the *Trimontium* of Roman history.

In entering the vale of Melrose, the Tweed is joined on the right by the Ettrick (previously augmented by the Yarrow), and next, on the left, by Gala Water, a river likewise famed in Scottish song, and now giving its name to Galashiels, a modern town on its banks, and the seat of an industrious and intelligent population. A short way above the confluence of the Gala with the Tweed, stands Abbotsford, half shrouded in the dark masses of plantations which surround it. Before leaving the pleasant and sunny vale of Melrose, the Tweed receives the Leader, from the Vale of Lauderdale, on its left bank. The country here becomes exquisitely beautiful, and the river passing on the left the deep shades of Dryburgh, amidst which repose the ashes of the great northern minstrel and novelist, proceeds for several miles without receiving any tributary of note till it approaches Kelso. Here, on passing on the right the ruins of the ancient castle of Roxburgh, famed in legend and history, the Tweed receives the waters of the Teviot, the largest of all its tributaries, and which almost doubles it in size.

Passing Kelso—one of the very handsomest Scottish inland towns, and situated on the left bank of the stream, which is crossed here by a bridge of noble proportions—the Tweed flows majestically onwards, receiving, on its left bank, the small river Eden, and soon after enters the beautiful district of the Merse, or lower division of Berwickshire, which it separates from Northumberland on the south. At Coldstream it receives the Leet on the Scottish side; and two or three miles farther down, on the English side, it is increased by the torpid waters of the Till, a riveret adjacent to the fatal field of Flodden, which may be now reached from the Scottish side of Tweed, by means of the stone bridge at Coldstream. Some miles farther on, it receives the Whitadder, a large stream, previously augmented by the Blackadder; and shortly afterwards, passing the ancient town of Berwick on its left, its waters are emitted into the German Ocean.

It is computed that the Tweed, from its sources to the ocean, a distance of ninety miles, drains a superficies of 1870 square miles; but in no part of its course, from the quick flow of its current, is it fit for purposes of navigation. It is, however, ferried in many places by boats, and affords, for considerable distances, a sufficiency of water for the sailing of *trows*, or small flat vessels, used in salmon fishing. Being thus undisturbed by traffic on its surface, and unadulterated by the liquid refuse of manufactories, as well as possessing, in general, a clean gravelly bottom, its waters are remarkably clear and sparkling in appearance. For a long period of time, the Tweed was crossed by only two bridges, the one at Berwick and the other at Peebles; but it has now several stone bridges, besides one of wood at Innerleithen, and three of the chain construction, all of which are of great service to the district, and serve to make the union of the two countries on the banks of the river more complete

The lengthened district through which the Tweed flows in its course to the ocean, is for the greater part of a pleasing sylvan character, the hills being never far from its banks, and the eminences and lower grounds frequently clothed by woods and plantations, sometimes exhibiting the stunted remains of "the forest," dedicated to the chase by the Scottish monarchs, and at other times showing grassy swelling hills, devoted to the pasturing of thousands of sheep. The Tweed and its tributaries have been long the resort of the trout and salmon fisher, every streamlet abounding in these objects of sport to the angler. We believe, however, that in recent times the waters have been fished to such an extent, and not by the most legitimate means of capture, as to be in a great measure harried of its finny tribes. An excellent road, at any rate, pursues the whole line of the river on its left bank, and the angler will find every species of accommodation for his comfort.

The Vale of Tweed being essentially of a pastoral and agricultural character, there are nowhere, of course, any of those overgrown masses of population, which, however suitable to the views of the political economist, are generally supposed to be so little conducive to the promotion of private virtue. The district makes up in the quality of its population what it wants in number. Its inhabitants are alike distinguished by a primeval simplicity of manners, and by an attention to the decencies of domestic life, which we shall hardly find so exquisitely combined in districts where superior natural advantages have given occasion to greater industry and wealth. The Merse, the principal division of country on the river, is universally allowed to be the most fertile and the best cultivated part of Scotland; the place where nature has been kindest, and the husbandman most inclined to cultivate her good graces. To the eye of a traveller, it seems rather a portion of rich and lovely England than of this "land of mountain and flood." It is tinged, as it were, with the geniality of the country to which it adjoins. It possesses the glorious hedgerows of England in the fullest perfection, with the lines of trees between; making each field resemble a splendid picture deeply and doubly framed. Here also are to be seen houses built with less regard to the harsh climate of Scotland, than those farther north. The honeysuckle and eglantine luxuriate around slim cottages and villas, whose large bow-windows, presented towards "the sweet south"—a thing to be seen nowhere else in Scotland—give assurance that there is here a greater sum total of summer delights than of winter discomfort. The sight of such beautiful and well-appointed residences fully justifies the honeymoon taste of the Scottish poet, who says to his mistress,

"We'll lodge in some village on Tweed."

But the general aspect of the Merse is worth a thousand of its details, pleasing and admirable as they are; and I do not know a finer sight in Scotland than that which is to be obtained of this luxuriant region, from some point on the Lammermuir or Eildon hills; especially on a fine July day, when the vast umbrageous plain is covered by a flood of glowing light, and the living spirit of repose seems to breathe throughout the far green retreats in the dazzling incense of the summer glim.

NATURAL HISTORY.

THE LION.

THE usual length of the lion, from the nose to the tail, is about six feet, and the tail itself upwards of three feet, ending in a tuft of blackish hair, and his height at the shoulders upwards of three feet. The general colour of the fur is tawny, paler below the belly. The legs are thick, short, and very strong; the feet large and spreading; the claws are capable of being drawn back, and are not contained in sheaths, but in the hollows between the toes, which are provided by nature for their reception, by the particular articulation of the last joint. The lion may at once be distinguished from all his congeners, by having a long and flowing mane, which rises in the middle of the forehead, and extends backwards over the shoulders, descending on each side of his neck and face. Except in youth, the skin of the lion never exhibits the least appearance of spots or stripes.

When we analyze the moral and intellectual faculties of the lion, it will be found that he manifests the same deceitful and vindictive passions as the whole of his congeners. The generosity and grandeur of his character, which has been handed down to us from remote ages, and which the fascinating pens of Buffon and other writers have depicted in such glowing and powerful language, may be looked upon as a series of beautiful and figurative fictions. His magnanimous forbearance and noble generosity have been greatly over-coloured. His personal history and disposition will be best gathered from the following anecdotes:—

The courage of the lion is proverbial, which alone can be attributed to elevation of sentiment, and the consciousness of his own physical powers, finding that there is no other animal of the forest who singly can overcome him. Attached by nature to the arid plains of Africa and Asia, he ranges uncontrolled, making the timid and defenceless antelope, and all the other beasts of the forest, an easy prey. "His pliable, agile, and sinewy frame, together with the resistless and impetuous fury of his attacks, enable him to overcome even the massive bulk of the elephant, rhinoceros, and buffalo. Roving in the boundless desert, the extensive plains, or in the shade of the vast jungles of his native country, he holds despotic sway, and is well deserving the title of the king of beasts But contrast him in the neighbourhood of large towns and populous districts, and it will be seen that his fortitude and conscious superiority are greatly modified; for in these situations he yields to the power of man, skulking only in the deepest recesses of extensive jungles, or in the impenetrable depths of mighty forests, seeking to overcome his unwary prey, by lying in ambush, and seizing them when they little expect his attacks. To the consciousness of a want of capacity to overcome the lords of creation, must in a great measure be attributed his docility under captivity; and to his native dignity of aspect he is indebted for the general impression mankind have formed of his nobleness of character and amiability of disposition."

The lion is destined by nature to subsist on animal food alone, and has been invested with physical energies, constructed on principles which give him, in an astonishing degree, the power of destroying animal life. His head is particularly large; his jaws have immense strength, and his shoulders and chest have a depth far exceeding all other animals of his size.

When in captivity, the lion is fed but once a-day and is generally allowed from eight to nine pounds of beef at a meal, exclusive of bones. He generally seized his food with avidity, instantly tears it to pieces with his claws, and voraciously devours it, contrary to the practice of those in a state of nature.

Africa seems to be the primitive country of the lion, for there he arrives at greatest strength and magnitude. He differs from the Asiatic lion, principally in being of a larger size, more graceful in his form, and in being darker in the colour, and the mane much less. But in Africa there are two varieties of this quadruped, which the settlers have long distinguished by the appellation of the black lion, having a somewhat darker colour, and the mane blackish, in contradistinction to the one which is of a pale colour all over. The black lion is considered the more ferocious of the two if he is pressed by hunger, and is said to be less scrupulous in attacking man than the other. This animal is sometimes of the astonishing size of nearly eight feet from the nose to the insertion of the tail, and the tail itself measuring four feet.

Like all his congeners, the lion sets out on his predatory excursions during the night; and his eyes are so formed, that nature seems to have designed him for a nocturnal animal, being constructed similar to those of the cat, so that the full glare of the vertical sun must be not only troublesome, but even painful to him: it is a knowledge of this which prompts travellers during the night to light fires, and keep them blazing, in order to scare away these dangerous intruders.

Frejus, in his "Relation of a Voyage made into Muritiana," gives a singular anecdote of a lion, which, he says, was related to him in that country by very credible persons. About the years 1614 or 1615, two Christian slaves at Morocco made their escape, travelling by night, and hiding themselves in the tops of trees during the day, their Arab pursuers frequently passing by them. One night, while pursuing their journey, they were much astonished and alarmed to see a great lion close behind them, who walked when they walked, and stood still when they stood. Thinking this a safe conduct sent them by Providence, they took courage, and travelled in the day-time in company with the lion. The horsemen who had been sent in pursuit, came up, and would have seized upon them, but the lion interposed, and they were suffered to pass on. Every day these poor fugitives met with some of the human race, who wanted to seize them, but the lion was their protector until they reached the sea-coast in safety, when he left them.

There was in the menagerie at Brussels a large lion, called Danco, whose den happened to require some repairs. The keeper brought a carpenter to mend it; but when the workman saw the lion, he started back with terror. The keeper entered the animal's cage, and led him to the upper part of it, while the lower part was refitting. The keeper then amused himself for some time playing with the lion; and being wearied, he soon fell into a sound sleep. The carpenter having full reliance on the vigilance of the keeper, pursued his work with rapidity; and when he had finished, he called him to see that the repair was to his mind. The keeper made no answer. Having repeatedly called in vain, he began to feel alarm for his situation, and he resolved to go to the upper part of the cage, where, looking through the railing, he saw the lion and the keeper sleeping side by side. From the impulse of the moment, the astonished carpenter uttered a loud cry; the lion, awakened and surprised by the sudden yell, started on his feet, and stared at the mechanic with an eye of fury, and then, placing his paw on the breast of his keeper, lay down to repose again. At length the keeper was awakened by some of the attendants, but did not appear the least apprehensive for his own safety, but shook the lion by the paw, and then quietly led him to his former residence.

A lion, which the French at Fort St Louis in Africa were about to send to Paris, on account of his great beauty, having fallen sick before the departure of the vessel which was to convey him to Europe, was loosed from his chain, and carried into an open area. M. Compagnon, author of "An Account of a Journey

to Bambuk," having returned home from hunting, found this animal in a very exhausted state, and out of compassion poured a small quantity of milk down his throat, whereby the lion was greatly refreshed, and soon after recovered his perfect health. From that time, the lion was so tame, and acquired so great an attachment for his benefactor, that he ate from his hand, and followed him about every where like a dog, with nothing to confine him but a slender string tied round his neck.

M. Felix, the keeper of the animals at Paris, in the year 1808, brought two lions, a male and female, to the Jardin des Plantes. About the beginning of the following June, he was taken ill, and was unable to attend the lions; another person, therefore, was under the necessity of performing this duty. The male, sad and solitary, remained from that moment constantly seated at the end of his cage, and refused to receive food from the stranger, whose presence was hateful to him, and whom he often menaced by bellowing. The company even of the female seemed now to displease him, and he paid no attention to her. The uneasiness of the animal afforded a belief that he was really ill; but he was so irritable, that no one dared to approach him. At length Felix recovered, and, with the intention to surprise the lion, he crawled softly to the cage, and showed only his face between the bars. The lion in a moment made a bound, leaped against the bars, patted him with its paws, licked his hands and face, and trembled with pleasure. The female also ran to him, but the lion drove her back, and seemed angry, and a quarrel was about to take place; but Felix entered the cage to pacify them. He caressed them by turns, and was afterwards frequently seen between them. He had so great a command over these animals, that, whenever he wished them to separate and retire to their cages, he had only to give the order. When he had a desire that they should lie down and show strangers their paws or throats, on the least sign they would lie on their backs, hold up their paws one after another, and open their throats.

The appearance of the lion has become well known in this country, by the public exhibition of various admirable specimens in a living state.

A STORY OF JAMAICA.

For more than a fortnight after my arrival in Jamaica, my energies, mental as well as corporeal, were literally prostrated by the relaxing effect of the climate. After having, with great exertion, got myself apparelled in the morning, in my light garments of linen and gingham, my occupation for the remainder of the day consisted in dragging myself, at intervals, from the sofa in the outer hall, across the slippery polished wooden floor (there are no carpets in Jamaica), to where the water-jar stood in the draught of the open verandah, in order to refresh myself with its contents.

It was not until a few weeks after landing that I was able to look about me. The place of my residence was high up in the interior, near the ridge of the Blue Mountains. My host, a countryman of my own, was proprietor of a thriving coffee plantation, and a gang (to suit my language to the subject) of fifty stout negroes, exclusive of women and children. After I had gathered strength enough, my host, in order to inure me somewhat to the climate, was wont, almost daily, to lead me short excursions on foot to the neighbouring estates and plantations (by which names the sugar and coffee farms are distinguished), with the proprietors or overseers of which we generally remained until the cool of the evening. Afterwards, we made shorter excursions on horseback. On one occasion, in pursuance of an arrangement made overnight, we started at the very first glimpse of day-light, for the purpose of riding about fifteen miles across the country to the property of a gentleman with whom we intended to remain for a few days. We were on horseback, and attended by an active young negro, my friend's body servant, seated on a mule, with our portmanteau before him. It was the coolest morning I had yet felt in Jamaica. The land-breeze was blowing strong and gusty, and showered down on us the heavy night-dews from the prickly lime-trees under which we rode, and not unfrequently we got a buffet from some of the over-ripe golden and perfumed fruit itself. Far down in the precipitous gullies, along the dizzy edge of which our road for the most part lay, and where the shades of night still rested, the yet unextinguished lamps of the fire-flies were still to be seen; whilst, in the more open parts of the pathway, the speckled lizards were frisking about in thousands.

It was indeed a delightful morning, and the only drawback to my enjoyment of it arose from the frightful nature of the roads during our journey, in regard to which, I suspect the denizens of Great Britain to be for the most part in a lamentable state of ignorance—supposing, as they seem to do, that Jamaica is one level expanse of fertile plains; whereas it is in truth from one end to the other little else than a succession of precipitous mountains, and glens of immense depth, fully rivalling in many places, if not surpassing, the most rugged and sublime scenery which characterises our own Scotch Highlands. It thus happens that the traveller's place of destination, which, were it possible to take a straightforward or bird's-flight path to it, would not exceed three or four miles' distance, is, by the process of winding down and re-ascending the gorges of the mountains, often protracted to above twenty. The roads themselves, cut out of the sides of the hills, are seldom broad enough to admit of more than one wayfarer passing along at a time; so that when two, coming from opposite directions, happen to meet, one must draw close in to the side of the bank, and stand stock-still, while the other passes forward; the almost inevitable consequence of any dispute as to the point of precedence on these occasions (and such quarrels repeatedly happen betwixt the negroes), being, that the horse or mule of one or other of the parties, and sometimes the riders or drivers themselves, are hurled into the gulf below. These narrow tracks, too, are frequently entirely washed away in many places, by the violent rains that rush down from the hills, so that travelling is often attended with no small degree of danger. This happened to be the case on the morning I now speak of; and constitutionally nervous as I was, and still am—a disease then much heightened by the relaxed state of my system—I must confess that, during my various excursions in the interior, I was repeatedly betrayed into an apparent timorousness of character, which gained me but little credit with the fearless planters, whom practice had rendered callous to all such qualms. On approaching such precipitous passes, my practice—a dangerous one, no doubt, but which I felt it absolutely necessary to adopt—was, instead of checking my horse, like my companions, to his most cautious and slowest pace, to get before them, and ride on as quickly as I could, until, by arriving at the next patch of level ground, I experienced some relief from my giddy sensations.

It was after accomplishing a feat of this kind, and when I had come to a fine level verdant bank, that sloped gradually down to a stream of some magnitude, that, with an ejaculation of thankfulness, I laid the reins on my horse's neck, and, lifting my panama from my head, wiped the perspiration from my neck and face. The wearied animal stopped of his own accord, and began feeding on the long guinea-grass that grew rank and wild about the road; and as my friend was some distance behind me, I had leisure for observation. The natural features of the place, indeed, were sufficient to excite interest and attention. High up the bank, the projecting hill, round the side of which I had just passed, came to an abrupt termination, presenting a flat, unbroken, perpendicular surface of solid rock. At a considerable distance below it, and nearer to where I was, lay an immense block of the same kind of stone, and which, but for its enormous size and the distance at which it lay from it, I would have supposed to have been at one time part of the mountain itself. Before and around it were all the appearances of there having been at one time a habitation of some consequence near the spot, although there was now no vestige of a human dwelling to be seen. Between the isolated rock and the end of the mountain appeared the remains of an orchard of tamarind and mango-trees, the latter bearing that superior kind of fruit denominated by the natives No. 11; whilst, from the rock almost down to the road where I was standing, thousands of shaddocks and oranges were hanging ripe and untouched upon the loaded branches. Around the whole ran a double row of cocoa-nut trees, forming three sides of a square, the fourth towards myself being open, whose great size betokened them ancient tenants of the soil. From the contour of the whole place, indeed, the idea at once suggested itself to me, that, where the huge piece of rock lay, a human abode ought to have been smiling, with the vines and pomegranates clustering around the green verandahs. I was still engaged in this speculative rumination, when my friend, with his attendant Phillidore, rode up; but instead of greeting me with his usual hearty laugh at my cowardice, as he used to term it, he requested me, with an unusal degree of seriousness, to "ride on."

"Oh, for any sake," I replied, "let us roost a while ere we commence another mid-air flight, and while we are on something *like* a road!"

"Move on, however, a little way—you will oblige me."

The tone in which he spoke this made me turn round and inquire anxiously if he were well.

"Perfectly—perfectly; but (here he lowered his voice) I never can pass this place without shuddering. Ride on—I will tell you the cause."

I rode forward, accordingly, as he desired me, until, after turning an angle of the hill, where the road became broader, he came up abreast of me, and said,

"I saw you were looking at that great piece of rock lying by itself on the slope of the bank. Did you observe any appearance of a human abode about it?"

"None," I answered, "unless its eligible site for one, and the convenient arrangement of the trees and fences about it; and I was just thinking, if the property were mine, I would soon set about blowing the rock to pieces, and constructing a domicile in its stead."

"I believe you would do no such thing," observed my friend, "did you know all about that place. Will you believe it, that, on the spot where that huge piece of stone now lies, a fine house once stood, and that it, with all its inmates, about a dozen in number, were in one moment buried under the mass?"

"Can it be possible! When or how did this happen?"

"I can tell you little about it, further than what I have gathered from the disjointed traditionary stories in the neighbourhood concerning the catastrophe. People are unwilling to talk of it hereabouts, notwithstanding its having happened so many years ago."

"The particulars, if you please," said I.

"Why, the story runs thus:—The house and property formerly belonged to a countryman of our own, who had amassed great wealth. His family consisted of only one daughter, a fine accomplished young woman, who had been educated in England. When he began to get old and infirm, he took a young Portuguese lad of vicious propensities into his employment, as bookkeeper, or negro attendant on his property, who, it is said, basely contrived to insinuate himself into the affections of the old man's daughter. The grief and rage of the father on discovering this were, of course, excessive, and he turned the Portuguese out of doors. The wretch, however, lingered about the property, and at last succeeded in bribing one of the negroes in the house to give his master poison, which soon carried the old man off. The daughter, little suspecting the cause of her father's death, and still retaining her affection for her betrayer, no sooner became her own mistress than she married him. An accidental circumstance, however, soon after discovered to her the murderous transaction, whereupon she ordered him to leave her presence for ever, threatening, if he did not do so, to give him up to punishment. The consequence was, that the ruffian, without scruple, took the same means of ridding himself of the daughter which he had done with the father, and thus became sole proprietor of the property. By his unfortunate wife he had a son; and after her death, he took a woman of his own nation to be his housekeeper, by whom he had a large family of sons and daughters. As they grew up, each seemed to strive to excel the other in all sorts of vice and villany; but as the parent had the precedence in years, he likewise kept the precedence in crime.

The deeds which I have heard narrated as having been transacted in that family, are beyond every thing horrible and revolting. Amongst many other acts of unheard-of cruelty, it is said, that, either from motives of fear or revenge, he lashed the poor ignorant negro whom he had formerly instigated to poison his old master, until he literally tore the flesh from his bones, and in that state tied him up to a tree near his house until the ants devoured him! At last," continued my friend, "a quarrel broke out between the criminal parent and his scarcely less criminal son—the eldest—and the latter was compelled to flee from the house to escape his father's vengeance. He went over to Carthagena, whence he contrived to open a correspondence with his stepmother, who was now experiencing all manner of brutal treatment from her lord and master, whose death it was at length concerted between them to perpetrate. The precautions of the old man, however, against the usual and more convenient mode of *poisoning*, precluded the possibility of their accomplishing it in that manner; and as they were afraid, in case of discovery, to seek the assistance of any of the negroes to execute it in a more violent way, it was ultimately agreed on between them that the son should murder the father with his own hand. He accordingly returned to Jamaica with an accomplice to whom he communicated his fell purpose; and having procured horses at Montego Bay, rode across the country until within a mile or two of his father's house. He then waited in the bush until it was dark, when, directing his companion to remain with the horses in readiness until his return, he proceeded on his diabolical errand. Whether he actually accomplished it, could not be ascertained, though it is almost certain that he must have gained admission to the house, from the circumstance of his never being more seen or heard of. About midnight, the inhabitants of the neighbouring properties were startled by a frightful shock, not at all resembling that of an earthquake; and the howling and screaming of the negroes soon told that some dreadful calamity had happened. On proceeding to the spot we have just passed, you may conceive their feelings of awe and horror on finding the place where that den of crime and infamy formerly stood, occupied only by a huge limb of the mountain, which had buried beneath it in a moment, and for ever, every vestige of the house and its guilty inmates. As the character of that family of crime had been long notorious, it appeared as if the Almighty had been provoked to extinguish them at once from the face of creation, and the rock, on that account, was thereafter appropriately denominated 'JUDGMENT CLIFF.'"

"It was certainly a singular and striking incident," I observed, after my friend had concluded his narrative; "but there is another circumstance much less preternatural, which seems rather remarkable: how could such crimes as you have stated to have been perpetrated by this family, be allowed to pass unpunished by the arm of the law?"

"You must recollect," was the reply, "that our criminal code was neither so comprehensive nor so strictly enforced then as now; besides, the stories circulated about these wretches could only have been

proved by the testimony of the negroes, whose evidence, were we to admit in their present ignorant and darkened condition, no *white* man's life would be safe."*

"Might not education," I rejoined, "render them in time worthy of freedom?"

"For mercy's sake do not broach that interminable topic now! Ride on—see, the thunder cloud is creeping down Portland-gap; we'll get a ducking if we don't make haste;" and so terminated our conversation.

* It will be observed, that the above conversation took place before slave evidence was rendered admissible in the colonies.

FAVOURITISM IN FAMILIES.

PARENTAL affection, with all its amiableness, and its high utility, is liable to some unhappy weaknesses, which often lead to fatal and distressing results. When indulged to an extravagant degree, without being tempered by that judicious severity which is required to keep in check the wayward and imperfect understandings of children, it completely mars their education, or, to use a common and expressive phrase, *spoils* them. When indulged partially among the various members of a family, its effects are hardly less fatal, while its criminality is seldom attended with the same excuse.

The first of these faults is fortunately rare; otherwise the native wickedness of the human heart would not be nearly so much repressed in grown society as it is. But the more guilty, though less fatal weakness, of showing an undue favour to a part of a family, to the exclusion of the rest, is much more common, if indeed it may not be said to pervade, more or less, the bosom of every existing parent. It requires little effort to show that this is one of the most cruel and unreasonable of all vices—though, seated as it is amidst the unapproachable mysteries of the heart, there may be more difficulty in administering to it even a slight degree of correction. External individuals are generally surprised to find that the preference of the parents, where it exists, is not occasioned by any superior merit or more engaging appearance in its objects, but more frequently seems to arise from the very absence of those qualifications. There may, it is true, be cause for the preference, where its object or objects are less favoured by nature than the rest; nay, humanity demands, in such cases, that the affections of the parents should be called forth in larger measure, to compensate, as far as possible, for the deficiencies of nature. But the preference often exists where there is inferior temper and character, without any peculiarity of organization to render it excusable. Love is expended where there is no love in return—where the disposition, on the contrary, is so harsh and cold, that Love, like the bird sent out by Noah, cannot find in it whereon to place his foot—while, on the other hand, children of docile and affectionate character, who might amply repay the fondness and care of a parent, are neglected. There is something so irrational, as well as so unjust, in all this, that observers are lost in astonishment at the blindness which may accompany a passion, in general the most praiseworthy, and beautiful to look upon, of all which animate our nature.

There would be little use in thus adverting to a weakness so well known, and so generally reprehended where it occurs, if we had not some hope of awakening the consciences of many who have no chance of otherwise being informed of their error. We recollect a simple but touching anecdote, which we encountered many years ago in the course of our juvenile reading, and which may perhaps, by being revived here, stir the souls of a few, to whom reasoning on such a subject might be useless. A lady of rank had two sons, from six to eight years of age, named John and Frederick, the former of whom she doated on with an extravagant degree of fondness, while she carried her neglect and contempt to as great an extreme towards his brother. John she was in the habit of calling exclusively "My son," as if she had deemed him alone entitled to that endearing appellation. As for Frederick, though he was a child of the best dispositions, and every way worthy of her affection, she held him in such contempt and detestation, as sometimes to scream when he came into her presence, and desire "that odious thing" to be taken out of her sight. All this was the more strange, as John did not seem to regard her with any remarkable degree of affection, but, on the contrary, would sometimes repel her caresses, as more troublesome than agreeable to him, and, in general, rather shunned than sought her company. One day, when she was in bed very seriously indisposed, she heard the door opened, and a young foot enter the apartment. Having longed exceedingly all the morning to see her favourite child, who, instead of inquiring for her, had been amusing himself out of doors, she now supposed that this must be he, and accordingly exclaimed, in a voice of passionate tenderness and delight, "My son, is it you?" "No, mamma," was the timid answer returned to her inquiry, "it is only Frederick." The poor child had crept, with the longings of undeserved affection, to his mother's chamber, expecting to meet some one who could inform him how she was; and, now, terror-struck lest her disappointment at finding *him* where she expected his more beloved brother, would draw forth her anger, and perhaps increase her illness, he was, after giving the above reply, about to leave the room. The mother, however, was touched by the unconscious accusation contained in her child's words, and, springing from the bed, she clasped him in her arms with an ardour as extreme as her former coldness, assuring him, with tears of penitence and affection, that he too was her son, and never again should be neglected. From that time forward, she was never observed to manifest the least partiality for either of her children.

If this story be true—which it has all the appearance of being—it proves that the reason, when once effectually roused upon this subject, has the power of overcoming the passion which inspires parents with these erroneous attachments. We, therefore, call upon all parents, *at this very moment*, to take themselves to task, and, if they be self-convicted of any undue preference of one child over another, let them exert their understandings to put down the unjust dictates of their feelings, and endeavour to equalise their affections over the whole of those who have a claim upon them. An injustice towards any individual in the little flock of which they have been made the keepers, is one of the most flagrant cruelties, and one of the most dangerous errors, that can be committed. It is the former, because no cruelty can be so shameful as that which is exercised upon a creature which neither provokes nor can resent it. It is the latter, because it is apt to derange all the best objects which we are enjoined to hold in view in the culture of youth, and thus occasion a serious damage to the general interest.

BOWED JOSEPH.*

THE mobs of Edinburgh have ever been celebrated as among the fiercest in Europe. The one which accomplished the death of Porteous, as narrated in the tale of the Heart of Mid-Lothian, was a most surprising instance of popular vengeance, almost surpassing the bounds of belief; though it must sink considerably in our admiration, when we reflect upon the power and ferocity which at all periods have characterised the actions of this monstrous and danger-fraught collective. The time has been when, in the words of the old song, "All Edinburgh" would "rise by thousands three," and present such a strength to the legal authorities that all opposition to their capricious will would be in vain. In the younger days of many now living, even the boys of the High School and of Heriot's Hospital could erect themselves into a formidable body, equally resistless and indomitable. It is a fact, ludicrous enough too, that when the lads of these different schools were engaged in any of those squabbles, formerly so frequent and fatal, between them, they always showed a singular degree of political sagacity when assailed by the town-guard, in immediately joining their strengths, and combining against the common foe, when for the most part they succeeded in driving them from the scene of action. When such was the power of boys and striplings in this ill-protected city, and such the disorderliness of holiday assemblies, there is little left for wonder at the ravages committed by a mob formed of adults, actuated by violent feelings of jealousy, bigotry, and revenge.

Of this uncontrollable omnipotence of the populace, the annals of Edinburgh present many fearful records. At the various periods of the reformation and the revolution, the chapel of Roslin was destroyed by a mob, whose purpose neither cooled nor evaporated in traversing a distance of eight miles. James the Sixth was besieged and threatened in his courts, and in the midst of his parliaments, by a rabble of mechanics, who, but for the stout walls of the Tolbooth, might perhaps have taken his life. The fine chapel of Holyrood House was pillaged of not only its furniture and other valuables, but also of the still more sacred bones which lay within its precincts, by a mob which rose at the revolution, and did such deeds of violence and rapine as fanaticism and ignorance alone could have excited. At the unfortunate issue of the Dover expedition, at the execution of Captain Green, at the Union, and at many other events of less importance, the populace of Edinburgh distinguished themselves by insurrection and acts of outrage, such as have alone found parallels, perhaps, in the various transactions of the French revolution. Even so late as 1812, there happened a foray of a most appalling nature; the sports of an occasion of rejoicing were converted into scenes of frightful riot, unexampled as they were unlooked for. The fatal melancholy catastrophe of this event had, however, the good effect of quenching the spirit of licentiousness and blackguardism in the Edinburgh youth, and finally undermined that *system* of unity and promptitude in action and in council, by which its mobs had so often triumphed in their terrible resolutions.

In this fierce democracy, there once arose a mighty leader, who contrived, by means of great boldness, sagacity, and other personal merits, to subject the rabble to his will, and to elect himself dictator of all its motives and exploits. The person who thus found means to collect all the monstrous heads of the hydra within the grand grasp of his command, was a little decrepit being, about four feet high, almost deprived of legs, and otherwise deformed. His name was JOSEPH SMITH, or more commonly "BOWED JOSEPH;" he lived in Leith Wynd, and his trade as a private citizen was a "*Buff-Belt-Maker*." This singular being, low, miserable, and contemptible as he appeared, might be said to have had at one time the complete command of the metropolis of Scotland. Whenever any transaction took place in the Town Council which Joseph considered to be of very improper tendency; whenever meal rose to whatever Joseph considered to be an improper price; whenever any affair in the city which did not exactly accord with Joseph's idea of right and wrong—in short, "*When they werena gude bairns*," this hero could, in the course of an hour, collect a mob of ten thousand persons, all alike ready to execute his commands, or to disperse at his bidding. For this purpose he is said to have employed a drum; and never surely had "fiery cross" of the Highland chieftain such an effect upon the warlike devotion of his clan, as "Bowed Joseph's drum" had upon the *tinder* spirits of the Edinburgh rabble. The "*lazy corner*" was a lazy corner no longer as he marched along—the *town rats*, as they peeped forth like old cautious snails from their Patmos in the High Street, drew in their horns and shut their door, as he approached—the West Bow ceased to clink as he descended. It seemed to be their enthusiasm to obey him in every order—whether to sack a granary, break the windows of an offensive magistrate, or to besiege the town council in their chamber. With all this absolute dominion over the affections and obedience of the mob, it is to be recorded to the honour of Bowed Joseph, that however irregular the nature of his authority, he never in any of his actions could be said to have transgressed the bounds of propriety. With great natural sagacity, he possessed a clear and quick-sighted faculty of judgment. And the real philanthropy of his disposition was not less remarkable than his other singular qualities. He was, in short, an advocate for *fair play*, as he called it, in every thing. Fair play alone was the object of his government, and nothing else.

The following interesting anecdote is handed down concerning Bowed Joseph, which proves his strong love of justice, as well as the humanity of his heart. A poor man in the Pleasance, from certain untoward circumstances, found it impossible to pay his rent at Martinmas; and his hard-hearted landlord, refusing a portion of the same with a forlorn promise of the remainder being soon paid, sold off the whole effects of the tenant, and threw him, with a family of six children, in the most miserable condition upon the wide world. The unfortunate man, in a fit of despair, immediately put an end to his existence, by which the family were only rendered still more destitute. Bowed Joseph, however, did not long remain ignorant of the case. As soon as the affair became generally known throughout the city, he shouldered on his drum, and after half an hour's beating through the streets, found himself followed by a mob of ten thousand people. With this enormous army he marched to an open space of ground, now almost covered by Eldin Street, named in former times Thomson's Park, where, mounted on the shoulders of six of his lieutenant-generals, he harangued them in the true "Cambyses vein," concerning the flagrant and fatal proceeding for the redress of which they were assembled. He concluded by directing his men to seek the premises of the cruel landlord; and as his house lay directly opposite the spot in the Pleasance, there was no time lost in executing his orders. The mob entered, and seized upon every article of furniture that could be found, and in ten minutes the whole was packed in the park. Joseph set fire to them with his own hands, though the magistrates stood by with a guard of soldiers, and entreated him to desist. The eight-day clock is said to have struck twelve just as it was consigned to the flames. When such was the strength and organization of an Edinburgh mob so late as the year 1780, we need scarcely be surprised at the instance on which the tale of the Heart of Mid-Lothian is founded, happening, as it did, at a much earlier period, and when the people were prompted to their terrible purpose by the sternest feelings of personal revenge.

In the exercise of his perilous office, it does not appear that Bowed Joseph ever drew down the vengeance of the more lawfully constituted authorities of the land. He was, on the contrary, in some degree countenanced by the magistrates of the city, who frequently sent for him to the council chamber, in cases of emergency, to consult him on the best means to be adopted for appeasing and dispersing the mob. On an occasion of this moment, he was accustomed to look very large and consequential. With one hand carelessly applied

* The matter of this article appeared originally in "The Traditions of Edinburgh," and "Illustrations of the Author of Waverley," by Robert Chambers.

to his side, and the other banged resolutely down upon the table, and with as much majesty as four feet, and a beard of as many weeks old, could assume, and with as much turbulence in his fiery little eye as if he was himself a mob, he would stand before them pleading the cause of his compeers, or directing the trembling council to the most expedient method of assuaging their fury. The dismissal of a mob, on these occasions, was usually accomplished at the expense of a few hogsheads of ale, broached on the Calton Hill, and by the subsequent order of their decrepit general, expressed in the simple words, "disperse, my lads!"

Having for many years exercised an unlimited dominion over the affections of the rabble, "Bowed Joseph" met his death at last, in a manner most unworthy of his character and great reputation. He fell from the top of a Leith coach in a state of intoxication, and broke his neck, which caused instantaneous death. He had been at the Leith races, and was on his return to Edinburgh when the accident took place; and his skeleton has the honour of being preserved in the anatomical class-room of the College of Edinburgh. Though fifty years have elapsed since his decease, Bowed Joseph is not yet forgotten in the town where he governed; for many an old man in Paul's Work and Leith Wynd will call his grandchildren about him of a king's birth eve, and tell them of the immortal achievements of his illustrious contemporary, General Joseph Smith.

An Edinburgh mob, although it may supply excellent subjects for tales, in all its characteristic fierceness and insubordination, is now a matter of mere antiquity. In the present day, the working classes of Edinburgh, from whom it may be supposed the principal materials of the mobs used to be draughted, are in the highest degree orderly, both in private conduct and in their public appearances in bodies. The printing-press, the schoolmaster, and that general improvement of manners which now prevails, have entirely altered the character of the populace, and any mischief now committed through public uproar is seen to arise not from the adult, but the juvenile and neglected portion of the community.

ORACLES AND MYSTERIES.

Mankind have been the victims of oracles, and mysteries, and pretended conjurors, and what they have chosen to call "wise men," ever since the beginning of time. Not contented with deriving instruction from the great volume of Nature spread out before us, and sufficiently capable, if rightly interpreted, to train the mind to wisdom, our poor infatuated race has too frequently been led to seek knowledge in the vain practice of astrology, divination, and other tricks and absurdities, now divested of all credit, and justly held in contempt by every reflecting mind. "Every one in early life (says an American writer*), in reading ancient history, is troubled to know what measure of credit should be given to the ancient oracles and mysteries, concerning which there are so many marvellous tales to be found. Rollin's ancient history, a book much read among us, often mentions the responses of the oracles of antiquity. The writer was a pious, excellent man, but was fond of the marvellous, and not a little inclined to superstition. He believed that wicked spirits were sometimes permitted, by an all-wise Providence, to reside in these caves or inner shrines, to deceive mankind, by indirectly shadowing forth things to come. Other historians have spoken of the magicians, soothsayers, and astrologers, as having great confidence in their supernatural knowledge.

The first account we have of these *wise men* is that given by Moses, in his interview with Pharaoh. They were soon convinced that they could not struggle with the great Lawgiver, and yielded after a few trials of their skill. These magicians were scientific men, who soon discovered the natural from the miraculous.

The whole worship of Isis, in Egypt, was full of mysteries, and these *wise men* alone had the key to them. Tombs, temples, and all public buildings, and all the arts and sciences, were full of mysteries to the common people. It was the same in Persia and Assyria as in Egypt. The wise men were advisers of the king, and he supported them in ease and dignity. They were called in by Belshazzar to interpret the hand-writing on the wall, but could not read it.

When the Greeks made themselves masters of the learning of Egypt and Babylon, they found these mysteries of no small importance to themselves. They kept up the same air of secrecy, and devoted them to religious purposes. The oracle of Delphos having by accident established a reputation for correct prophecies, continued it, by art, for religious, but more frequently for political purposes. The Pythia, in every age, was a shrewd woman, who knew what was wanted, and who it was that inquired of her for knowledge; and her answers were made accordingly. The Egyptians and the Greeks were well acquainted with acoustics, and sounds were managed for their mysterious responses. That they understood the science of sound, witness the ear of Dionysius. The mysteries of Isis, and the Eleusinian mysteries, were kept up by subterranean caverns, so constructed as to throw strange images before the eyes of the initiated, by means of moveable lights, and by tubes conveying strange sounds, when they were in darkness, to frighten them. Every one can tell how busy the imagination is when we are a little alarmed for our safety. These strange sounds, persons accompanying those about to be initiated, were allowed to hear, and sometimes they saw flashes of strange lights. There can be no doubt but that some of these ceremonies were awfully imposing. The higher orders unquestionably understood the whole thing, but the lower did not. From the whole concurrent testimony of ancient history, we must believe that the Eleusinian mysteries were used for good purposes, for there is not an instance on record that the honour of an initiation was ever obtained by a very bad man. The hierophants—the higher priests of the order—were always exemplary in their morals, and became sanctified in the eyes of the people. The high-priesthood of this order in Greece was continued in one family, the Eumolpidæ, for ages. In this they resembled both the Egyptians and the Jews.

The Eleusinian mysteries in Rome took another form, and were called the rites of Bona Dea; but she was the same Ceres that was worshipped in Greece. All the distinguished Roman authors speak of these rites, and in terms of profound respect. Horace denounces the wretch who should attempt to reveal the secrets of these rites; Virgil mentions these mysteries with great respect; and Cicero alludes to them with a greater reverence than either of the poets we have named. Both the Greeks and Romans punished any insult offered to these mysteries with the most persevering vindictiveness. Alcibiades was charged with insulting these religious rites; and although the proof of his offence was quite doubtful, yet he suffered for it for years in exile and misery; and it must be allowed that he was the most popular man of his age.

These mysteries were continued until some time after the days of Constantine, in the sixth century, when they were prohibited. Sad stories have been conjured up to give importance to the Egyptian mysteries, but no one has attempted to throw any dark shade over those of Greece or Rome. The philosopher will readily believe that there was nothing supernatural in any of their mysteries; and all may set it down as a fact, that the initiated never pretended to any thing like a commerce with the inhabitants of the invisible world. They unquestionably often assumed to possess wondrous powers and great secrets; but this was only a means of keeping knowledge from becoming too common; and this was an error which lasted for ages, even down to our times.

Viewed by the light of a clear understanding, I believe all the marvellous deeds of the magicians, the astrologers, the soothsayers, the Pythia, and the whole tribe of these mystery-dealing beings, vanish into things, if not easily explained, yet certainly to be traced out. Incantations, charms, and talismans, which thicken on every page of early history, are dissolved before the torch of reason.

The Sibylline Oracles of Rome had once great influence among the people, and many honest men have now a belief that these oracles foretold the coming of Christ; but the wise part of our theologians have long since given up this fancy, for it can hardly be called a belief. The fourth pastoral of Virgil contains the supposed prophecy. The following is as fair an account of it as we have seen:—

'The Sibylline Oracles having received information from the Jews, that a child was to be born, who should be the Saviour of the world, and to whom nations and empires should bow with submission, pretended to foretell that this event would occur in the year of Rome 714, after the peace concluded between Augustus and Antony. Virgil, viewing this prophecy with the vivid imagination of a poet, and willing to flatter the ambition of his patron, composed his celebrated Eclogue, entitled *Pollio*, in which he supposes the child, who was thus to unite mankind and restore the golden age, to be the infant with which Octavia, wife to Antony, and half-sister to Augustus, was then pregnant by her former husband Marcellus. In this production the consul Pollio, Octavia, and even the unborn infant, are flattered with his usual delicacy; and the rival Triumviri, though a short time before in open hostility, have the honour of equally sharing the poet's applause.

'While Pollio, who seems to have been the most accomplished man of his age, and is celebrated as a poet, soldier, orator, and historian, was engaged in an expedition against the *Parthini*, whom he subdued, Virgil addressed to him his *Pharmaceutria*, one of the most beautiful of all his eclogues, and in imitation of a poem of the same name by his favourite author Theocritus. This production is the more valuable, as it has handed down to posterity the superstitious rites of the Romans, and the heathen notions of enchantment. Virgil himself seems to have been conscious of the beauty of his subject, and the dignity of the person whom he was addressing, and accordingly has given us, by the fertility of his genius, and the brilliancy of his imagination, some of the most sublime images that are to be found in any of the writings of antiquity.'

Some of the Christian fathers have stated, that on the eve of the birth of Christ, all the oracles of the heathen world ceased. It is certain that the Delphic oracles grew into disrepute about this time; but the Eleusinian mysteries, and those of the Bona Dea, were kept up much longer. Milton adopted the belief of the early fathers of the church, and has expressed his poetical opinion, in an ode upon the subject of the silence of the oracles, which is full of deep interest and exquisite beauties. But there is no more reason to think that he was convinced of this as a fact, than that he believed all the incidents in his Paradise Lost.

All superstitions are to be traced to the diseases of the body or the mind. The filtres and charms are made for a diseased body or mind. Sometimes they may be efficacious, by chance; sometimes nature, the best of nurses, overcomes all obstacles, and heals the malady in spite of the nostrums prescribed. Among the ignorant, in all nations and ages, these panaceas are found. The greater the ignorance, the more efficacious the charm. The charm called the Obi, or Obiah, which is now practised in Jamaica, and other slaveholding places, was brought from Africa, and is now known throughout the country bordering on the Senegal and on the Gambia, and probably is a very ancient superstition. Something resembling this charm has been practised by the Indians all over the North American continent.

Feeble minds, under the influence of supposed guilt, are more likely to be affected by superstitious feelings than strong ones, full of deeds of blood. Sickness, fatigue, and hunger, would have made Hercules a whining child, as chills and fever did the mighty Cæsar; but a sound mind in a sound body, with a good education and a clear conscience, will never fear the charms of superstition, the spells of witchcraft, nor the power of magic. The seeds of superstition are too often sown in the nursery, and cherished in our youthful days. Bugbears are too often mingled with lullabies, and raw-head and bloody-bones with the first tales given to amuse infancy. The household divinities should all be pure, kind, lovely characters, having countenances of beauty, and tongues of truth. The stories of the fireside should be free from all hobgoblins and monsters.

There are perhaps many things in our history, and even in our natures and our hopes, hard to be understood, and some portion of them that the Great Author of our race never intended that we should be fully acquainted with. A sound mind will very readily comprehend enough of its powers and capacities to teach it, never to strive to attain what is above human reach, or to sink with fear at that which it cannot readily explain. Seen by the light of philosophy and sound sense, all the marvellous deeds of the magician, the astrologer, and the whole tribe of those who attempt to deceive the people, sink into those of common men."

* Advice in the Pursuits of Literature, by Samuel L. Knapp. New York. 1832.

BIOGRAPHIC SKETCHES.

ROBERT MACKAY, THE HIGHLAND BARD.

To those who look upon Ossian as exclusively the forgery of a modern man of letters, it may be startling to know that the Highlands of Scotland produced, during the last century, various poets, who, without any thing like what is considered as education—without even having learned the letters of the English alphabet, or having ever conversed except in Gaelic—composed verses by no means inferior in merit to those of the supposed son of Fingal. It must of course be obvious, that, if the Highlands produced men of this kind in a recent age, the district might have produced another such as Ossian in one somewhat less recent (though not perhaps in the fourth century), as for many hundred years the general state of intelligence was not greatly altered. One of these Highland bards of distinguished merit was Duncan M'Intyre, a poor Perthshire peasant, whose verses are said to manifest the purest and most delightful sentiment; and yet we remember being informed by the late Mr A. Campbell, editor of Albyn's Anthology, that, on the Earl of Breadalbane asking Duncan what he could do for him, by way of advancing him in life, the poor man was found to have formed no wish more ambitious than that of being made a soldier in the town-guard of Edinburgh—a ridiculous species of military police, in which the pay was sixpence a-day! Another eminent poet of the north was Robert Mackay, the subject of the present memoir.

Robert Mackay, otherwise called Rob Donn—that is, Brown Robert—was born in the year 1714, at Durness, in Sutherlandshire, the most northerly, and perhaps the most wild portion of the Scottish Highlands. His father was an honest herdsman, of whom nothing particular is related; but his mother is remembered as a woman of vigorous understanding, and a perfect adept in Highland poetry and music. From her, it is evident, Rob received the mantle of Gaelic poesy. Besides the minstrelsy with which she stored his mind, he had no other acquaintance with any kind of literature, spoken or written, except what he gained from hearing extempore translations of Scripture in the parish church. It must be remarked, as sensibly diminishing the wonder of his achievements as an author, that, though there was at that time no such thing as reading in the country, the common people mingled

so much with their more literate superiors, as to put it in the power of any one of tolerable capacity to pick up much of what may be termed general information. In his childhood, Rob tended calves on the hill-side; but at seven years of age he was taken into the family of a gentleman of the clan Mackay, who carried on an extensive business as a dealer in cattle, and began to be employed in the task of driving herds into the south of Scotland and the north of England. As life advanced, his witty sayings, his satires, his elegies, and, above all, his love-songs, began to make him famous, not only in his native glen, but wherever the herdsmen of a thousand hills could carry an anecdote or a stanza, after their annual peregrinations to such scenes as the tryst of Falkirk and the fair of Kendal. Donald Lord Reay, the chief of the clan, and proprietor of the vast tract of mountain-land where Rob was born, was a true-hearted chief, resident constantly among his children, and participating in all their affections; he soon became acquainted with the merit of his humble clansman, and, having perfect confidence in his fidelity and steadiness, promoted him to the office of his *boman*, or cattle-steward—a place of considerable importance in the household of a nobleman whose estate was chiefly employed in the rearing of herds.

Rob now married and settled in life; he was a faithful *boman*, and his master estimated him highly; but the bard had some habits which could not be indulged in the immediate neighbourhood of the noble lord's residence, without giving occasion to scenes of a disagreeable nature in the household; and, after a few years, the connection was broken off, though without any interruption of personal good-will on either side. Rob was an inveterate deer-hunter: from earliest youth it had been his delight to spend days, nights, and weeks, among the wildernesses, in pursuit of this spirit-stirring diversion; and among prouder titles to distinction, his kinsmen honoured him as a marksman of the first order, and a very master of the mountain chase. In his boyish years, no one had ever dreamt of restraining indulgences of this kind; and though now law had been added to law, and regulation to regulation, "Honest theft is the spoil of the wild deer," continued to be a proverb in every mouth, and even the *boman* of Lord Reay was a constant trespasser. More than once he narrowly escaped the arm of the law, and yet nothing seemed capable of converting him from this darling error.

He was more than once detected in the forbidden act, and eventually summoned before the sheriff-substitute, when, in the event of sufficient evidence, the issue must have been banishment to the colonies, in terms of the statute. An anecdote on this occasion, strongly characteristic of the bard, has been lately related to us by his still surviving daughter. He set out to attend the court, early in the morning, accompanied by one of his wonted hunting companions. The prospect of transportation pressed heavily on his neighbour's spirit, but the bard remained seemingly quite tranquil. Not so his wife, who, with lamentations and tears, could not be prevented from accompanying her husband a part of the way. The bard would not even now part with his favourite gun, but shouldered it, at departing, with his wonted glee. They had not proceeded beyond a mile from home, when they came full upon a small flock of deer. The bard was not to be restrained. He fired, and shot two of them dead upon the spot. His wife, in great consternation before, was now not to be pacified. She imagined that her husband had just sealed his doom. He beseeched her to be silent. "Go home," said he, "and send for them; if I return not, you shall have the more need for them; but saluting her, and, in kindlier terms, he added, "Fear not; it shall go hard with me if I am not soon with you again to have my share." The fact was, that though thus threatened by the authorities, there was scarcely one of the country gentlemen who would not have gone any length to protect the bard from the violence of the law.

Perhaps the deer-shooting, then, might have been got over. But Rob, in an evil hour, composed a satirical ballad in reference to a transaction of a very delicate nature in the noble household. Rob's presbyterian spirit was kindled by what he considered as a patronage of impurity in high places; he indited a bitter epithalamium, and received his mittimus from Lord Reay. That the dismissal was reluctant on the part of the nobleman, may be inferred from the affectionate terms of an elegy, in which Rob not long after lamented his death. Meantime, Colonel Mackay, son of the gentleman into whose family he had been taken in his boyhood, readily afforded him shelter and protection. The bard, with his wife and children, removed a little to the northward, and continued happy in the colonel's employment, until the first regiment of Sutherland Highlanders was embodied, in 1759, when he was prevailed on by the country gentlemen holding commissions in the new corps, to accompany them. Rob enlisted as a private soldier, but was never called on to take any part in troublesome duty. While his companions in arms were toiling and fretting at drill, Robert was at large, enjoying his choice society or contemplations.

We doubt not, had the regiment ever been called into action, Rob Donn would have been found at his post. But no such occasion ever occurred. On the peace of 1763, they were marched back to Sutherland, and there reduced, with this honourable distinction in the course of their short service, that no restrictions had ever been required among them, and no man punished. As they had assembled as a corps with the primitive manners of a pastoral life, so they separated with these habits unchanged, and had the happiness of returning to their native glens, without a single individual among them having disgraced his corps, kindred, or district.

Rob Donn returned to his former quarters, and does not appear ever again to have wandered from them. His wife was a kind and prudent one: he turned out a steady and attached husband to her, and a careful and affectionate father to thirteen children. It speaks a very great deal for the worth of his personal character, that although he was dreaded as a satirist throughout the north Highlands, quite as much as ever Burns was in Ayrshire, he was promoted in due time, with universal approbation, to the dignity of an *elder* in the parish where he resided, and that he continued to hold that respectable and responsible station, without reproach, to the end of his life. The satirist, in short, was dreaded, but only by the vicious; and the poet was at once respected and beloved by all whose esteem he desired to possess. His society was courted by his equals, still more by his superiors; no social party was esteemed a party without him; no public meeting of the better and the best of the land was felt to be a full one without Rob Donn being there. Rob, as may be supposed, had no objections to his fair share of feast and bowl, but he never contracted dissipated habits of any kind, nor even showed a passing symptom of having taken a glass too much, until his robust constitution gave way, about the period of the grand climacteric. A northern *sennachie* has given the following account of his latter end:—

"I remember Rob Donn very well. He was brown-haired, brown-eyed, rather pale complexioned, and, I would say, good-looking. When he entered a room, his eye caught the whole at a glance; and the expression of his countenance always indicated much animation and energy. In figure, he was rather below the middle size, strong, and well formed. In the month of December 1777, he attended the interment of an uncle of mine, who was a *co-age* of his. When the coffin was lowered into the grave, Robert turned to me and said, 'There is my *co-age* committed to earth, aged sixty-three; and before this time next year I shall also be laid down here.' It is remarkable that this prediction was fulfilled, by his death taking place in August 1778; so his age was exactly sixty-three years nine months." Rob was honoured with a funeral like that of a high chief; the proudest and the simplest of the clan stood together with tears in every eye, when he was laid in the churchyard of his native parish; and a granite monument, of some mark and importance, has been erected over his remains, at the expense of a certain number of enthusiastic Mackays, with inscriptions in Gaelic, in English, in Greek, and in Latin.

After enjoying a legendary fame for fifty years, a collection of Rob Donn's poems was published at Inverness in 1829, by Dr Macintosh Mackay, then minister at Laggan, but now of Dunoon, on the Clyde. His satirical pieces are said to be the best; but they lose their relish in a translation. Of his other pieces, including elegies and love-songs, some specimens are given in literal English in the Quarterly Review for July 1831, from which we have derived the greater part of the present memoir. (The article was the composition of Sir Walter Scott.) We shall conclude by extracting a portion of one of the latter kind, composed during a sleepless night at the town of Crieff, in reference to a Highland mistress, from whom he had been long absent:—

"Great is my esteem of the maiden,
Towards whose dwelling the north wind blows;
She is ever cheerful, sportive, kindly,
Without folly, without vanity, without pride.
True is her heart—were I under hiding,
And fifty men in pursuit of my footsteps,
I should find protection, when they surrounded me most closely,
In the secret recess of that shieling.

Oh for the day for turning my face homeward,
That I may see the maiden of beauty:—
Joyful will it be to me to be with thee,
Fair girl with the long heavy locks!
Choice of all places for deer-hunting
Are the brindled rock and the ridge!
How sweet at evening to be dragging the slain deer
Downwards along the piper's cairn!

Great is my esteem of the maiden
Who parted from me by the west side of the enclosed field;
Late yet again will she linger in that fold,
Long after the kine are assembled.
It is I myself that have taken no dislike to thee,
Though far away from thee am I now.
It is for the thought of thee that sleep flies from me:
Great is the profit to me of thy parting kiss!

Dear to me are the boundaries of the forest;
Far from Crieff is my heart;
My remembrance is of the hillocks of sheep,
And the heaths of many knolls.
Oh, for the red-streaked fissures of the rock,
Where, in spring time, the fawns leap;
Oh, for the crags towards which the wind is blowing—
Cheap would be my bed to me there!"

RHEUMATISM.

Last week we said a few words on the subject of colds and rheumatism: we now propose to give a short exposition of the nature and mode of cure of the latter complaint, and that in the words of the agreeable author of the Economy of the Human Body.

"Rheumatism is divided into *acute*, when there is high fever and excessive pain of the parts affected; and *chronic*, when there is no fever, and when the pains are less severe and intermittent. Acute rheumatism differs from gout, in not usually coming on so suddenly, but gives warning by a gradual increase of pain. Neither is it fixed to one spot like the gout, but is distinguished by its frequent wanderings from place to place, accompanied by a sense of numbness. It seldom attacks the small joints, but is confined chiefly to the larger, as the hip, knee, and shoulder. Acute rheumatism is generally attended by a continued fever, whereas the gout has periodical remissions. Like most inflammatory complaints, it is preceded by rigours and a sense of cold. There is febrile, quick, and hard pulse. The veins near the part affected swell, and a throbbing pain is felt in the arteries. By degrees the pain increases, and the patient suffers cruel torture, which is increased with the least motion. The sense of pain resembles that of a slow tearing or gnawing of the parts, and commonly goes off by a swelling of the joints affected.

Obstructed perspiration, occasioned either by wearing wet clothes, lying in damp linen, sleeping on the ground or in damp rooms, being exposed to cool air when the body has been much heated with exercise, or coming from a crowded public place into the cool air, is the cause which usually produces rheumatism. Those who are much afflicted with this complaint are very apt to be sensible of the approach of wet weather, by feeling wandering pains about them at that period.

From these symptoms it will be seen that acute rheumatism is an inflammatory affection of some texture or textures of the body. Some have supposed its seat to be in the tendinous coverings of the muscles, some in the fibres of the muscles themselves, others in the substance or coverings of the arteries and veins, and others again in the nerves or their coverings. The popular idea that rheumatism is seated in the bones, is a very vague notion.

Acute rheumatism usually comes on with lassitude and rigours, succeeded by heat, thirst, anxiety, restlessness, and a hard, full, and quick pulse. The blood drawn from a vein exhibits a buffy inflammatory appearance, and the tongue preserves a steady whiteness. After a time, excruciating pains are felt in different parts of the body, but more particularly in the joints of the shoulders, wrists, knees, and ankles, or perhaps in the hip, and these keep shifting from one joint to another, leaving a redness and swelling in every part they have occupied, as likewise a great tenderness to the touch. Towards evening there is an increase of the fever, and during the night the pains become more severe, and shift from one joint to another. In no disease do we meet with so many and sudden changings and shiftings of the pain. Sometimes these pains leave the surface and extremities, and attack the internal parts of the body, such as the diaphragm, heart, brain, &c. It is in such cases that rheumatism becomes a dangerous and fatal disease; for, in its ordinary appearance, although a painful, it is not a dangerous affection.

Acute rheumatism being of an inflammatory nature, its cure consists in observing all the rules already laid down in treating of such complaints, such as cool air, low diet, perfect rest, and bleeding from the arm as often and to such a degree as circumstances require. In weak irritable habits, when no great degree of inflammation prevails, and little fever attends, and where the inflammation is chiefly local, bleeding, by means of leeches applied to the part affected, may be substituted instead of using the lancet, and will often be found to afford essential relief. This may likewise be used with benefit when much inflammation prevails in the system, as well as in particular parts, provided that general bleeding has also been practised.

When the pains are general and wandering, no local application should be used in acute rheumatism. All undue warmth, stimulating liniments, and warm fomentations, only aggravate the complaint. On the contrary, when the pain is fixed in one place, where there is redness, heat, and swelling, some cooling evaporating lotion may be applied with advantage, such as two drachms of muriate of ammonia and two of nitre, dissolved in a pint of water, or a weak mixture of camphorated spirits with vinegar or water.

Chronic rheumatism may occur after an attack of acute rheumatism, the one passing into the other, or it may originate in a primary disease. It is attended with pains in the head, shoulders, knees, and other joints, which at times are confined to one particular part, and at others shift from one joint to another.

without occasioning any inflammation or fever; and in this manner the complaint continues often for a considerable time, and at length goes off, leaving the parts which have been affected in a state of debility, and very liable to fresh impressions on the approach of moist damp weather. Little danger is attendant on this species of rheumatism, although it is a painful lingering disease; and a person once having been attacked with it, is ever afterwards more or less liable to returns of it; and stiffness of the joints, and a total disuse of their motions, are often the consequences of frequent attacks.

In chronic rheumatism there is no need of general bleeding from the system; nor is local bleeding resorted to, unless in cases where there is marked redness, tenderness, and inflammation of a particular joint, ligament, &c.

In ordinary cases, some stimulating liniment, as the tincture of soap, with opium, is to be rubbed into the parts several times a-day, and warm flannel afterwards rolled round the limb. Friction with the hand or flesh-brush is to be diligently used, and the vapour-bath applied to the limb, or a warm bath for the whole body is of the greatest benefit in relieving pain.

Pouring warm water from a kettle on the limb several times a-day, but more especially the vapour-bath applied to the limb, has been found of the greatest consequence in obstinate cases of rheumatism: after these, electricity and frictions may be applied. Camphor dissolved in æther, and applied externally, in painful affections of the joints, has likewise afforded singular relief.

The internal treatment consists in attending to the state of the bowels and digestive organs; a derangement of which often causes chronic rheumatism, or pains very much allied to it. For this purpose, moderate doses of calomel, rhubarb, and other purgatives, are to be frequently given.

Exercise, either of the whole body or of particular limbs, is highly important; and, to exercise the arms, the dumb-bells answer very well. For the lower extremities, nothing can be better than walking; and although it may prove a little irksome at first, in some cases, still by perseverance much benefit will soon be experienced. Want of exercise is apt to induce stiffness of the joint.

The clothing should be warm and comfortable, with flannel next the skin; and a flannel bandage put tight on the affected limb often affords relief. The diet should be light, but nourishing.

Chronic rheumatism often seizes the back and loins, giving rise to the disease called *lumbayo*. This is a most painful complaint, the patient often being unable to stand upright or move in bed. It sometimes fixes in the hip joint, and is then called *sciatica*. Both these affections are to be treated in the same manner as chronic rheumatism, by frictions, stimulating liniments, mild sudorifics, spare diluent food. After the severe symptoms are over, a large plaster to the back in lumbago will be found to give firmness and strength to the muscles."

WASHINGTON AND HIS MOTHER.

In a former number of the Journal, we presented our readers with the biography of Washington, a man whose memory meets with the highest respect, not only by the Americans, to whom he secured the blessings of national independence, but by the British, whose warlike efforts he powerfully assisted in frustrating. The following notice of the early days of this great man, is from the Juvenile Miscellany, a production of the United States, and will be perused with interest and edification by our young friends, who will see how much depends on attending to the admonitions and guidance of a good mother.

"It is impossible to visit the shades of Mount Vernon (where Washington resided, and now lies buried), to stand near the tomb where the father of his country reposes, to see the gardens which he cultivated, the mansion where he rested from the toils of war, the piazza where he so often lingered to view the setting sun gild the mighty river Potomac, without desiring to be acquainted with his domestic life, and save from oblivion every circumstance respecting him. Many anecdotes of his early years are treasured in this land of his nativity. Some of the most interesting ones were derived from his mother, a dignified and pious matron, who, by the death of her husband while her children were young, became the sole conductress of their education. To the inquiry, what course she had pursued in rearing one so truly illustrious, she replied, 'only to acquire *obedience, diligence*, and *truth*.' These simple rules, faithfully enforced, and incorporated with the rudiments of character, had a powerful influence over his future greatness.

He was early accustomed to accuracy in all his statements, and to speak of his faults and omissions without prevarication or disguise. Hence arose that noble openness of soul, and contempt of deceit in others, which ever distinguished him. Once by an inadvertence of his youth, a considerable loss had been incurred, and of such a nature as to interfere immediately with the plans of his mother. He came to her with a frank acknowledgment of his error, and she replied, while a tear of affection moistened her eye, 'I had rather it should be so, than that my son should have been guilty of a falsehood.'

She was careful not to enervate him by luxury, or weak indulgence. He was inured to early rising, and never permitted to be idle. Sometimes he engaged in labours which the children of wealthy parents would now account severe, and thus acquired firmness of frame and a disregard of hardship. The systematic improvement of time, which from childhood he had been taught, was of great service when the weight of a nation's concerns devolved upon him. It was then observed by those who surrounded his person, that he was *never known to be in a hurry*, but found time for the transaction of the smallest affairs in the midst of the greatest and most conflicting duties. Such benefit did he derive from attention to the counsels of his mother. His obedience to her commands, when a child, was cheerful and strict; and as he approached to maturer years, the expression of her slightest wishes was a law.

Her common influence over him was strengthened by that dignity with which a strength of mind had invested her. This imparted to her great elevation of feeling. During some periods of our revolutionary war, when the fears of the people were wrought up to a distressing anxiety, many mistaken reports were in circulation, which agonised the hearts of those whose friends occupied posts of danger. It would sometimes be said to her, 'Madam, intelligence has been received that our army is defeated, and your son a prisoner.' 'My son,' she would reply, 'has been in the habit of acting in difficult situations.'

At length the blessings of peace and independence were vouchsafed to our nation, and Washington, who for eight years had been divided from the repose of home, hastened with filial reverence to ask his mother's blessing. The hero, 'first in war, first in peace, first in the hearts of his countrymen,' came to lay his laurels at her feet, who had first sown their seeds in his soul.

This venerable woman continued, until past her ninetieth year, to be respected and beloved by all around her. At length the wasting agony of a cancer terminated her existence, at the residence of her daughter, in Fredericksburg, Virginia. Washington was with her in the last stages of life, to mitigate the severity of her sufferings, by the most tender offices of affection. With pious grief he closed her eyes, and laid her in the grave which she had selected for herself. It was in a beautiful and secluded dell, on the family estate, partly overshadowed by trees, where she frequently retired for meditation, and where the setting sun beams with the softest radiance.

Travellers who visit the tomb at Mount Vernon, will find it interesting to extend their visit to this spot—where the mother of our hero, whom he was thought, in person and manners, greatly to resemble, rests without a stone.

We have now seen the man, who was the leader of victorious armies, the conqueror of a mighty kingdom, and the admiration of the world, in the delightful attitude of an obedient and affectionate son. We have traced many of his virtues back to that sweet submission to maternal guidance which distinguished his early years. She whom he honoured with such filial reverence, said, that 'he had learned to command others, by first learning to obey.'

Let those, therefore, who in the morning of life are ambitious of future eminence, lay the foundation of filial virtue, not expect to be either fortunate or happy, while they neglect the injunction, 'My son, keep thy father's commandment, and forsake not the law of thy mother.'"

BIRD-NESTING IN THE SOUTHERN OCEAN.

Mr Earle, in his interesting "Narrative of a Residence in New Zealand, and Tristan d'Acunha," gives the following amusing piece of natural history, in speaking of his visit to the latter island. It relates to a strange kind of birds called *penguins*, which abound in southern latitudes:—"This day we visited what they call a 'penguin rookery.' The spot of ground occupied by our settlers is bounded on each end by high *bluffs*, which extend far into the sea, leaving a space in front, where all their hogs run nearly wild, as they are prevented going beyond those limits by those natural barriers; and the creatures who, at stated periods, come up from the sea, remain in undisturbed possession of the beaches beyond our immediate vicinity. The weather being favourable, we launched our boat early in the morning, for the purpose of procuring a supply of eggs for the consumption of the family. We heard the chattering of the penguins from the rookery long before we landed, which was noisy in the extreme, and groups of them were scattered all over the beach; but the high thick grass on the declivity of the hill seemed their grand establishment, and they were hidden by it from our view. As we could not find any place where we could possibly land our boat in safety, I and two more swam on shore with bags tied round our necks to hold the eggs in, and the boat with one of the men lay off, out of the surf. I should think the ground occupied by these *birds* (if I may be allowed so to call them) was at least a mile in circumference, covered in every part with grasses and reeds, which grew considerably higher than my head; and on every gentle ascent, beginning from the beach, on all the large grey rocks, which occasionally appeared above this grass, sat perched groups of these strange and uncouth-looking creatures; but the noise which rose up from beneath baffles all description! As our business lay with the noisy part of this community, we quickly crept under the grass, and commenced our plundering search, though there needed none, so profuse was the quantity. The scene altogether well merits a better description than I can give—thousands and hundreds of thousands of these little two-legged erect monsters hopping around us, with voices very much resembling in tone that of the human; all opening their throats together; so thickly clustered in groups, that it was almost impossible to place the foot without despatching one of them. The shape of the animal, their curious motions, and their most extraordinary voices, made me fancy myself in a kingdom of pigmies. The regularity of their manners, their all sitting in exact rows, resembling more the order of a camp than a rookery of noisy birds, delighted me. These creatures did not move away on our approach, but only increased their noise, so we were obliged to displace them forcibly from their nests; and this ejectment was not produced without a considerable struggle on their parts; and, being armed with a formidable beak, it soon became a scene of desperate warfare. We had to take particular care to protect our hands and legs from their attacks; and for this purpose each one had provided himself with a short stout club. The noise they continued to make during our ramble through their territories, the sailors said was, 'cover 'em up, cover 'em up.' And, however incredible it may appear, it is nevertheless true, that I heard those words so distinctly repeated, and by such various tones of voices, that several times I started, and expected to see one of the men at my elbow. Even these little creatures, as well as the monstrous sea elephant, appear to keep up a continued warfare with each other. As the penguins sit in rows, forming regular lanes leading down to the beach, whenever one of them feels an inclination to refresh herself by a plunge into the sea, she has to run the gauntlet through the whole *street*, every one pecking at her as she passes without mercy; and though all are occupied in the same employment, not the smallest degree of friendship seems to exist; and whenever we turned one off her nest, she was sure to be thrown among foes; and, besides the loss of her eggs, was invariably doomed to receive a severe beating and pecking from her companions. Each one lays three eggs, and, after a time, when the young are strong enough to undertake the journey, they go to sea, and are not again seen till the ensuing spring. Their city is deserted of its numerous inhabitants, and quietness reigns till nature prompts their return the following year, when the same noisy scene is repeated, as the same flock of birds returns to the spot where they were hatched. After raising a tremendous tumult in this numerous colony, and sustaining continued combat, we came off victorious, making capture of about a thousand eggs, resembling in size, colour, and transparency of shell, those of a duck; and the taking possession of this immense quantity did not occupy more than one hour, which may serve to prove the incalculable numbers of birds collected together. We did not allow them sufficient time, after landing, to lay all their eggs; for, had the season been farther advanced, and we had found three eggs in each nest, the whole of them might probably have proved addled, the young partly formed, and the eggs of no use to us; but the whole of those we took turned out good, and had a particulary fine and delicate flavour. It was a work of considerable difficulty to get our booty safe into the boat—so frail a cargo—with so tremendous a surf running against us. However, we finally succeeded, though not without smashing a considerable number of the eggs."

A HAUL OF WOOD IN NEWFOUNDLAND.

How pleasing to the feelings of the enlightened and beneficent part of mankind will be the perusal of the following extract from the letter written by a Mr Morris, in Newfoundland, to Lord Bexley, and quoted as a note in Macgregor's British America. The incident related is one of the best illustrations that could be given of the principle of "peace and good will," which, we trust, will at some time universally prevail:—"It is a general custom at Newfoundland for the labouring classes and others, in the winter season, as a compliment to the clergyman, to bring him from the interior a quantity of wood or fuel. The friends of the clergyman of the established church at Saint John's, some short time ago, proposed what is there called a 'general haul of wood' for his benefit. I had the gratification of hearing the good, pious, and venerable bishop of the Roman Catholic church, address his numerous congregation, and request of them that they would join in the haul of wood, and that their general exertions, in behalf of his brother of the established church, would be more gratifying than any thing they could do for himself. On the day of the haul, it was most gratifying to observe the Roman Catholics, united with their brethren of every other religious persuasion, moving immense masses of wood towards the worthy minister's house. The great body of the working people were Irish, or their immediate descendants; and I can assure your lordship that it warmed my heart, though the mercury was fifteen degrees below zero, to observe the perspiration floating down their manly brows, whilst vying with the people of other countries, and other religions, as to who should pay the greatest compliment to the respected individual. The quantity of wood hauled out by the united efforts of the people was great indeed; but it would be an act of injustice to the individual for whose nominal benefit this haul was made, not to state that it was soon conveyed from his residence to warm the cheerless cottages of the poor, the sick, the widow, and the orphan."

Column for Schoolboys.

THE ROMAN POETS—ELEGIAC AND SATIRICAL.

Having in my preceding papers given you a sketch of the more common Latin or Roman classical writers in use at schools, I now proceed to say a few words regarding some others not so generally studied by the young, but of which it is as well you should know something. Those I have now to speak of are of two classes—the elegiac and the satirical poets. Among the elegiasts, we have Catullus, Tibullus, Propertius, and Lucretius; and of the satirists, Persius, Juvenal, and Martial. The whole lived about the beginning of the Christian era.

In the composition of elegiac or sentimental pieces, Ovid has been given the first place among the poets of Rome, though in some respects he has been excelled by Catullus, his contemporary, who possessed great originality of thought. Catullus was born in the year 86 before Christ, of a respectable family. His poems have been justly eulogised by his countrymen, and, to the number of one hundred and fifteen, have come down to the present times. Although he lived before the Latin tongue was in its greatest purity, yet he attained great beauty of expression, simplicity, and ease, and is known to have studied the Greek elegiac poets, Sappho, Simonides, and Callimachus. Catullus wrote a beautiful ode to his native place, the peninsula of Sirmio, in the lake of Benacus, now called Lago di Garda, in Italy, which has been translated into English by Leigh Hunt. It is as follows:

O best of all the scattered lands, that break
From spreading sea or hill-retiring lake,
How happy do I drop within thy breast!
With what a sigh of full, contented rest!
Scarce trusting, that my vagrant toil is o'er,
And that these eyes behold thee safe once more
Is aught so blest, as such a loose from care,
When the soul's load rests with us in the chair,
When we return from pilgrimage, and spread
The loosen'd limbs o'er all the well-known bed?
This of itself repays the grinding toil,
And gives to failing knees the freshening oil.
Hail, lovely Sirmio! meet thy master's smiles;
And laugh, thou sparkling lake, through all thine isles;
Laugh, every social spot, your master's come;
Laugh, every dimple on the cheek of home!

Tibullus, who was born a little later, and on the same day with Ovid, in the year 43 before Christ, died when forty-four years of age. Tibullus moved in the first rank of literary men and their patrons. He was an associate of Mæcenas, Virgil, Ovid, and Horace. His elegies, which are reckoned exceedingly beautiful, and by many thought to excel those of other poets, have been translated and published in English; but they are little appreciated in the present day. "From the general tenor of his writings," say the learned authors of the Bibliotheca Classica, "he appears to have been of a gay, lively, and cheerful disposition, and it cannot be denied that he made love and pleasure too much the theme of his muse. Like other writers on these topics, to follow either his advice or example would be to forget the dignity of man." Dr Currie, in his Life of Burns, has an allusion to the muse of Tibullus breathing in that unfortunate Scottish poet, and awakening strains destined to immortality on the banks of Ayr. Propertius, another Roman poet of a similar character, was born in the year 58 before Christ, and was therefore a contemporary of Tibullus. He wrote no more than four books of elegies.

With regard to the merits of these various elegiac poets, according to modern ideas, little can be said. Their sentiments and the subjects they treat upon are generally alike impure and unfit for popular perusal. In many instances, their writing is only appreciated from the beauty of the language. Lucretius, who flourished during the Augustan age, was a poet somewhat of a different stamp. He was born in the year 98 before Christ, and is known to have become a great adept in the doctrines of the Greek philosopher Epicurus, which he extols in his poetic compositions. Lucretius is thus called a didactic poet, but the instructions he gives the world through his versification would now be considered very miserable. He maintains the eternity of matter, the materiality of the soul, and the non-existence of a Supreme Being. Dr Blair remarks, that the only passages in the works of Lucretius which render the subjects tolerable in poetry, are the digressions on the evils of superstition, the descriptions of the plague, and several other incidental illustrations, which are remarkably elegant, nd adorned with a sweetness and harmony of versification peculiar to that poet.

Horace, whom I have already noticed, was the most remarkable of the Roman poets for a delicacy of raillery and wit, and in this respect he has scarcely been equalled, even by the most ingenious of the moderns. Persius, Juvenal, and Martial, also displayed much excellence in this dangerous species of composition, but each differed from the other in the style of writing and poignancy of satire.

Persius was born in the reign of Tiberius, about the year 33 of the Christian era, and died at the premature age of twenty-eight, in the reign of the Emperor Nero. Persius completed his education at Rome, where he associated with the most refined men of the age, particularly Lucan, another writer of note, who lived at the same period. In this species of society, being stimulated by an ardent desire for knowledge, he made considerable progress both in philosophy and literature. He possessed a strictness of principle which appears in his writings, and his life is said to have corresponded with the rigid doctrines of the Stoics, to whose philosophy he attached himself. Persius wrote when very young; but out of his multifarious productions, a few were only distinguished, and of these six satires have been transmitted to modern times. His chief merit lay in contemptuous sarcasm; and he is not esteemed either for the elegance or force of his language. Though attacking the follies of mankind generally, he alludes too much to local and temporary circumstances, and this has tended to lessen his fame. The satires of Persius have been translated into English by Dryden, Sheridan, Brewster, Owen, Madan, Drummond, and others, of whom Brewster and Madan are reputed to be the most successful.

Juvenal was a contemporary of Persius and Martial, or nearly so. He was born in the neighbourhood of Rome, in the year 40, of obscure parents, and of his early history little is known. At an early age he took upon him the duty of lashing the follies of those about him, and of exposing the vicious to contempt; and there was room for the exhibition of his talent. Regardless of the consequences, he directed his satiric effusions against the minions of the court of the Emperor Domitian, for which he was sent into a sort of banishment into Egypt, in the office of a centurion, which he executed for some time. Juvenal possessed a true nobleness of mind. He disregarded wealth, if put in competition with the practice of virtue, which he lost no opportunity of holding up to the admiration of mankind. His keen and forcible satires are justly considered a model of dignified composition, and have been much esteemed in subsequent times. Juvenal lived to an old age, and died in the year 128, at which time the graces of the Augustan age of literature had in a great measure departed. He has been called "the last of the Roman poets;" for none of any eminence appeared after him. The satires of Juvenal have been similarly translated into English verse by Stapylton, Dryden, Gifford, Marsh, and Hodgson, and into prose by Sheridan, Stirling, and Madan.

Martial was a contemporary of Persius, being born in the year 29; he however long survived that poet, and died as late as 104. He lived through the reigns of Galba, Otho, Vetellius, Vespasian, Titus, and Domitian; and by the last-mentioned he was raised to the equestrian rank, and promoted to the office of tribune. Martial is known as an epigrammatic writer. His style is full of quibbles and pert satire, but of such a nature as to illustrate the manners of a very licentious age, which did not escape punishment by his pen.

CHAMBERS'S EDINBURGH JOURNAL.

In commencing the publication of Chambers's Edinburgh Journal, it was our most anxious wish to establish, *for the first time*, an engine of universal instruction, conducted on such principles as would render it a welcome and friendly visitor not only at the firesides of every class of society, high and low, without respect of party or sect, in Great Britain and Ireland, but wherever the English language was spoken, or its literature appreciated. A very short time proved the entire success of our scheme. The Journal has long since found its way, without the aid of patronage, or any other artificial means of dissemination whatsoever, into every part of the United Kingdom, from the most northerly point of Zetland to the British Channel, as well as into all the principal towns in North America, and most other places on the globe where English or Scotch are settled; while, as we predicted, our novel plan of diffusing useful knowledge and innocent means of entertainment, without interfering with the prejudices or prepossessions of mankind, and thereby, as it were, gaining the whole human race for an audience, has been in some measure pursued by others who have followed in our course. With these gratifying results before us, and while regularly disseminating to the extent of *two hundred and fifty-four thousand* printed sheets monthly, we have frequently had cause for deep regret in perceiving that the newspaper press generally spared no pains to misrepresent the nature of our employment, and, by a most wilful perversity of reasoning, accused us of illegally trenching on the ground possessed by the publishers of stamped sheets. We are, however, glad to say, that a more just and more charitable view of our labours is now beginning to be taken by the newspaper press, whose circulation is much more likely to be increased than diminished through the taste for reading which we create. The *Dumfries and Galloway Courier*, one of the cleverest and certainly the most amusing of our provincial prints, in speaking of what has been accomplished by means of improvements in printing machinery, has the following notice of our productions in the paper for September 10:—

"Nor are matters more stationary in the moral world. Society, as we have already remarked, has its tides; and even in the moral statistics and annals of the poor, changes are occurring, calculated to lead to the mightiest results, and which might well guide the speculations of moralists, statesmen, and economists, were they apprised duly of their nature and existence. Of this we will give an example, of which we were ourselves ignorant till the other day. Conversing with a bookseller, chance brought on the carpet, among other topics, the comparative merits of Chambers's Journal, the Penny and Saturday Magazines, Mrs Johnstone's first number, &c. &c. All of these periodicals, and especially the first, have an extensive circulation in the south of Scotland, and we were surprised when our friend said, seriously and solemnly, 'Yes, Chambers has done what others could not do, not even the Tract Societies; opposition might hamper, but could not hinder the triumph he has achieved; already he is enthroned in the minds of the poorer reading public, to say nothing of others, and has proved to them a real benefactor and friend.' 'How?' we exclaimed, more puzzled than ever. 'How! by banishing trash, and substituting useful and entertaining knowledge in its stead. If reading be the food and drink of the mind, there is certainly a great difference between a wholesome and a deleterious article or beverage.' 'Granted.' 'Well; not many years ago, I drew L.30 annually for trashy ballads, and still more trashy pamphlets, such as John Cheap the Chapman, Paddy from Cork, &c. A neighbour very near me dealt still more extensively in the same wares; and if you take into view the whole trade, you may form some idea of the wide-spread circulation of ballads, many of which were not free from indecency. But now "the Dublin robber,"

> 'Who robbed the rich, and did bestow,
> And gave to such as were poor and low.'

'John Cheap,' and 'Gregor's Ghost,' are never once asked for, and I no longer keep such trash in my shop. The country people must read something, particularly in winter, when the nights are long and the days short; and although economy be an object with them, they soon learn to distinguish, where a selection is offered, between sense and nonsense. Your high-priced periodicals they cannot buy; but the moment you combine economy with utility, some little bird whistles the tidings, which spread as fast as moor-burn in spring; and if you only choose to watch, on certain days, the milk-boys returning seated on donkeys or donkey-carts, you will discover that almost every urchin among men is thumbing Chambers in place of a ballad, and reaping the benefit of a partial perusal earlier than either his master or mistress. You yourself mention, in your character of Gilbert Burns, how much he felt delighted when Robert took a seat beside him on a barley sheaf, and read the first draft of the 'Cottar's Saturday Night.' That poem may be unequalled in merit; but the Journal also contains gems which keep down scandal in the harvest field, and are talked of and felt when the reapers unbend their backs at the bottom of *a breck*, or rest during the morning and mid-day meals. The tracts were cast too much in the same mould, wanted variety, and had other faults, which narrowed their circulation, and defeated the praise-worthy intentions of their authors; and my firm conviction is, that Chambers has done more to wean the people from trash, cultivate their minds, and excite curiosity, than all the Tract Societies that ever existed.'"

The intelligent speaker afterwards adds, that the cheap periodicals "are every where creating something like a soul under the ribs of death, and conferring, even while they are injuring men of original genius, the most important benefit on the community at large." A sentiment here requires in a certain degree to be modified. So far as regards our own publications, men of original genius have no reason to complain of injury. We give employment to a number of literary men, who receive a ready and adequate remuneration for their labours; and, considering the slender chance which most authors have of benefiting by the writing of books, a great deal more money, we venture to say, is thus dispensed in increasing the stock of original literature, than if the old system of publication, to the exclusion of the cheap periodicals, had still existed. By our own publications alone, there are put into circulation upwards of *twenty thousand pounds* annually, out of which sum an immense number of persons are partially or wholly supported—at least benefited to an extent which would be in no respect compensated by an abandonment of our trade to the former patrons of literature.

Edinburgh: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Orr & Smith, Paternoster-row, London; and W. Curry, Jun. & Co., Dublin. Agent in Glasgow, John Macleod, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct branch of human knowledge, appears once every fortnight.—Subscribers in Edinburgh may have these papers left at their houses as they appear, by giving their addresses at 19, Waterloo Place, and paying subscriptions for a quarter, a half year, or a year, in advance.—Price of a quarter of the Journal, 1s. 6d.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company.

CHAMBERS' EDINBURGH JOURNAL

CONDUCTED BY WILLIAM AND ROBERT CHAMBERS, EDITORS OF "CHAMBERS'S HISTORICAL NEWSPAPER" AND "INFORMATION FOR THE PEOPLE."

No. 90. SATURDAY, OCTOBER 19, 1833. PRICE THREE HALFPENCE.

PALLIATIONS.

"I could see through the soft appliances and easy palliations of some men."—KING CHARLES THE FIRST.

PERHAPS no deliberate crime or error was ever yet committed by any man, without his having some excuse to make for it to himself, not only at the time, but for a long while after. The virtuous part of the public is very far wrong, if it supposes that the *other portion* acts in a mere spirit of recklessness, or in cool defiance of what it knows to be right. In reality, the wicked and the foolish conceive themselves to have just as good motives, and to be as much in the right *abstractly*, as the just and the wise. He who steals rather than work, convinces himself, in the first place, that no work is to be had; the robber upon a large scale always makes up for his assaults upon the rich, by being amazingly charitable to the poor. If any one commits a rash and cruel action, he persuades himself afterwards that he was in a passion at the time, and tries to nurse up his wrath, and keep it warm, that it may still appear to justify what he did. We are never, in short, deficient in excuses and palliatives for any offences except those committed by our neighbours; in considering these, we generally contrive to be remarkably candid.

In the lesser affairs of life, we have exactly the same apologetic system. "Bring me a glass of brandy," says one visitor of a coffee-room, "*for I am very cold.*" "Bring me the same, with water," cries another, "*for I am very warm.*" Hardly any one has the honest hardihood of Foote, to call for the liquor "*because I like it.*" No, we will not confess even to ourselves the genuine vicious or self-indulgent motive which lurks at the bottom of our hearts: we are always so very polite and fair-spoken within the court of our own conscience. It is only when we see other people going wrong, that our disinterested indignation finds a vent; in such cases, silence would be a crime, forbearance a participation of the offence. We must launch forth, if it were only to show how very far we are from countenancing such doings, how impossible it is that we should ever commit them ourselves.

It is sometimes very amusing to observe how, when a man begins to wax a little wealthy, he also begins to convince himself of the necessity of certain luxuries. The habits and maxims of a straitened home still perhaps cling to him, and, even though certain that he can well afford what he desires, yet such is the effect of his customary state of feeling, that he has to make almost every new indulgence appear to himself in some measure as only an expedient in economy, or at least as absolutely unavoidable. Say that for some time past he has ceased to complain of the exorbitant rents demanded for houses, which used for years to be often in his mouth, and begun to let forth some hints as to the unproductiveness of property, the difficulty of getting good tenants, and the length of plasterers' and painters' bills—that he has even begun to take a curious and unwonted interest in a certain neglected portion of the newspapers, where estates are advertised for sale, and ascertained from his physician that application to business in the evenings is likely to tell soon upon his health—say that he has reached this point:—how delightfully, some fine afternoon, does the vision of a neat curricle, calculated to hold four besides the driver, come into his mind! A curricle, however, is an expensive thing. Moreover, it is a shockingly dashing thing, and does not at all suit with the sobriety of his character. Still more especially, it is a thing which would excite remark among his compeers. What would Gardner say? what would Simpson think? what would they all say at the club?—however, it is absolutely necessary for health; that is perfectly clear. I think I might venture upon a horse, without being thought *very* extravagant. *Extravagant*, did I say? Why, I believe I would gain by keeping a horse. In the first place, if it improved my health, which it is sure to do, what a saving in doctors' bills! Then, I could only ride in the morning before breakfast; to do so, I must go early to bed at night: that would save me going to the Bridgewater Arms, where, one night with another, I spend half as much as the daily keep of a horse. And then the opportunity of getting this cheap mare, which Johnson says he is tired of, and has no fault whatever—only three-and-twenty guineas, which the hostler tells me I could get for her at any time I chose to part with her. A stable, too, offered at such a reasonable rent by Bennet, and so near our warehouse, that it may serve at the same time for putting lumber off our hands. As for a groom, our own porter, or even one of the apprentices, will be quite able to attend her. So, really, no one can say that I am in the least extravagant—more especially when my health would be so much improved by it. And, as my wife says, if I don't take good care of my health, where will all the family soon be? I am, therefore, determined in future to take proper exercise, and preserve my health whatever be the consequences.

The horse, of course, is bought, and much about the same time it is thought *absolutely necessary* by the lady of the house, that the family should be removed to sea-bathing quarters. This "absolutely necessary" of Mrs Balderstone startles the gentleman a little at first—for why should it be absolutely necessary *now*, and not so before, when our circumstances were not so good? or why should it be absolutely necessary to *us*, while thousands of families struggle through existence without any such expedient being ever thought of. The objections of Mr Balderstone, however, seldom prove of much avail against the sage reasons of his lady. "When you have the horse at any rate," says she, "it would be *so* convenient. You could ride to town every morning to attend business, and come home in the afternoon to dinner. And only think how moderate the rent of the lodgings is—only three guineas a month, including the use of that large garden. Why, we'll save it all in kitchen vegetables, or gooseberries for the children. And, besides, Willy is really in such a state, that I cannot think of his being kept in town any longer; the doctor says ——" &c. Mr Balderstone of course gives in, for not only is he sensible that

> "Nocht's to be won at woman's hand,
> Unless ye gi'e her a' the plea,"—

as the old song says—but he has himself a treacherous inclination towards the indulgence, on the conviction that his health (that is, his pleasure) "requires a taste of the country air in summer."

This does very well for one year; but if things have been continuing still further to prosper with the worthy couple, riding on horseback is found to be a solitary and somewhat dull kind of recreation; not to speak of the mud which you are occasionally compelled to bring home with you, and which is utterly destructive to clothes. Besides, you cannot well hold up an umbrella in riding, and the showers of rain, which it is now quite impossible to count upon not falling, have already almost brought back that bad cold you had in 1829. A doubt at the same time is also begun to be entertained by Mrs Balderstone, if there be any economy in renting a house in the country, even with the advantages of free vegetables and gooseberries. Some day after these cogitations, or rather one morning at breakfast, Mr Balderstone, with his eyes bent on the advertising columns of a newspaper, and his hand supplying his mouth with spoonfuls of warm tea, thus suddenly opens his mind. "Why, the very thing I was thinking about. You know, my dear, I have for some time had an idea of buying a gig, being quite done up with that horrid riding: and here, I declare, is what will exactly answer the purpose: listen—'For sale, an excellent second-hand four-wheeled gig, with double seat, and set of harness in good condition: to be disposed of remarkably cheap, being the property of a gentleman about to leave the country: may be seen at Hobday's from eleven to three, Sundays excepted.' Off I set instantly. No, stop, I must'nt appear to be in a hurry. It would look as if I were too anxious. Let me see; ay, I'll step down about half-past one, and in the meantime I'll go round by the counting-house, and put a few pounds in my pocket. Well, this is really being lucky; you know, I mentioned before there would be no additional expense in keeping a gig, or a thing of this sort. The same horse will answer, the same premises, the shed in the back court will do for keeping all safe, just as well as a regular coach-house; the same person, that is, Samuel Hughes, the porter, will keep the whole in trim, I'll warrant him. Besides, I hear the tax is to be taken off gigs of all kinds; and what more need be said on the subject? In fact, it is all one as to expense, and I am sure there can be no comparison between an amusement which one enjoys by himself, and one in which one's wife and children can participate." "Oh, it would be so delightful," strikes in Mrs Balderstone, who has been listening all the time with pleasure depicted in her countenance. "Such an excellent plan! By all means, go down and buy the gig; it will be very cheap, I daresay. How nice it will be to have a drive occasionally along with *you*: the children, too, would be *so* much the better of it." "And as to that neat cottage, my dear," continues she, "which you have been offered so low—you will surely just close with it, and we can all go down in May. I am quite tired of this place, where we are completely overlooked by Mrs Hodgson, the controller-general of the neighbourhood. And I am sure the interest of your money could be nothing to the expense of country lodgings, which you know is always very high;" a fact discovered by Mrs Balderstone since last year, but a very good fact for all that.

Having been already pretty well convinced of the advantage of this bargain, you lose little time in completing it—and then behold you with a country-box, and a curricle, all arising from an idea of saving tenpence of an evening at a club, and the "absolute necessity" that "Willy" should have the benefit of sea-bathing! After such wide and rapid stretches, it is easy to see that you cannot long endure the dust to which you are exposed in an open vehicle in summer, or the cold in winter, but must have a full-grown carriage at once; and that when once you have got a carriage, you must also have a somewhat larger house to match with it. In short, you very speedily find yourself living in a style of first-rate expense, though every step you made in advancing to it appeared to you at the time as either an attempt at greater frugality, or a matter of downright compulsion.

It would be all very well if these soft appliances were only brought to bear in such cases as the above. But the unfortunate truth is, that we use them most frequently for the extenuation of real guilt, or to bolster us up in some unhappy error of judgment. We would recommend a rigid self-examination in all the affairs that lie between ourselves and our consciences, and when any thing like an "easy palliation" can be detected, let it be denounced at once at the bar of our

own judgment, and care taken to exclude it for the future. Good is only progressive: many persons may have been in the habit of presenting kind apologies to themselves for their own errors, without knowing that they were doing any harm. It is to such that we particularly address this little essay; and if it should serve to put even a small part of the number upon their guard, its object will have been accomplished.

ADVENTURE OF THE ETTRICK SHEPHERD.

By Himself.

It is now many years since, being informed by the people at the Castleton of Braemar, that no Lowlander, and perhaps no human being, had ever explored the sources of the Dee, I resolved to confer upon myself, if possible, the honour which Bruce obtained in his famous expedition to the head of the Nile, and for that purpose arose one morning before daylight, and having breakfasted, and loaded a guide with victuals, set off on my singular adventure. My guide's name was John Finlayson, a shrewd clever fellow, and one who really knew the mountains well, having been an incorrigible deer-stalker, of which the greater part of his discourse consisted.

We passed up by Mar Lodge, through the forest, and up by the linns of the Dee; but these have been already so truly and so accurately described in Chambers's Journal, that I can add nothing to them. All above that, the description does not coincide with my remembrance. The pines become thin and straggling, and stunted in their growth, and at length utter desolation reigns. We came to a farm-house, the last in the glen, inhabited by a Mr Fletcher. He was very kind to us, and we got our dinner there. He took me out, and showed me a part of his sheep, ewes, and wedders, mixed. They were rather good black-faced sheep, but in low condition that year. He told me, however, that his farm had no bounds: he might farm as far as he liked in some directions—for upwards of twenty miles at least—and that his great concern was to keep his stock in some reasonable bounds. I think he said he had likewise a stock of Cheviot wedders.

I asked him how far we were from the sources of the Dee. He said he did not believe that any living man knew where the outermost sources of the Dee sprung, but that it could not be less than ten miles distance. The day being remarkably fine, we pushed on, but rather uncertain how our adventure was to terminate, Finlayson assuring me from the beginning that I little knew the task I was undertaking. As far as I remember, we walked for an hour; but I had drunk some of Fletcher's whisky-toddy, and may be wrong; I think it was at least four miles farther up the glen, that we came to a shepherd's bothy, the last inhabited place in that wilderness, where we got some milk. The shepherd could not speak English, but he told Finlayson that no man alive knew where the sources of the Dee were, for they had never been seen, and were inaccessible, but that we were at least twenty miles from them. This was staggering news. I made Finlayson ask him, as there was no house nor bothy beyond that, if we could not go from his cot early in the morning, reach the sources of the Dee, and the tops of the Grampian mountains surrounding it, and reach the Castleton of Braemar that night. He answered that it was out of the power of man, and Finlayson coincided in the opinion.

Resolved not to be foiled, we posted on until we came to the place where two mountain streams met, the one named by Finlayson the Guisachan, and the other the Garchary, as near as I can spell them. At this place, the two sister streams conjoining, take the name of the Dee, so that nominally I was at the head of the Dee. But no; that was not what I wanted. I yearned to see its very uttermost springs on the heights of the Grampians, and was resolved to accomplish that at any risk.

Where these two mountain streams meet, and the Dee nominally begins, it is a very considerable river, as large as the Yarrow—pure as crystal, and very rugged and rapid, and I thought it a strange thing to see such a river swarming with fish, and not a human habitation nor a living creature within view, save a few straggling lean deer. As the Garchary keeps the line of the main river, straight N.N.W., I looked on that as the main source, and resolved to investigate that to its springs, the more particularly, as the same far surpassed all that I had ever seen for horrid grandeur. You say the hills are some miles asunder, but in the Garchary, which is at least five miles in length, they are in many places not above a bow-shot asunder. The east side is not far from perpendicular, the western side more than perpendicular, in many places overhanging the torrent. The bottom of the glen is crammed full of rocks, which have tumbled down for ages—ay, for thousands of years before the Mosaic creation—and over these the torrent roars, as white as snow, and a large torrent it is. I wondered to see the streams so large so near the tops of the mountains; but the everlasting clouds of rain and mist which shroud the Grampian depôts, keep the rivers always full.

In one place the Garchary tumbles over a waterfall, which is at least a thousand feet high. It is not a perpendicular fall like those of Foyers and Grey-mare's-tail, but it seemed to me to fall, at an average, about one foot in two. It is indeed a terrible scene. But as I described it in poetry on the spot, and in the enthusiasm of the moment, I shall present you with that instead of plain prose, and I hope you will acknowledge that Childe Harold himself never excelled it.

Well, the bottom of the Garchary being impervious, my guide carried me over the eastern branch with some difficulty, and taking a sweep to the right, we began to ascend the steep brows of Benmuichdhui; for the afternoon being uncommonly fine, and we having still some hours of sunshine before us, I resolved to avail myself of the rare opportunity, and gain the height—for at that time I cared not how much I walked, but rejoiced in it, and the more difficult the undertaking, I liked it the better. Long before we reached the top, we lost sight of vegetation, and got among small whitish stones; while the ptarmigans were croaking around us in hundreds, like as many puddocks, and often fluttering out from amongst our feet. How Finlayson did curse them in his broken dialect, between the Gaelic and the Aberdonian! for I had absolutely refused to let him take his gun with him, a huge family piece, like a carabine, that had been taken by his grandfather on the field of Tranent; and, moreover, I had neither game licence nor liberty to shoot, and I could not think of being taken for a poacher in my friend the Earl of Fife's forests, with whom I was to dine at Mar Lodge one of the following days.

Well, to the top of Benmuichdhui we got, not more than an hour, or at most an hour and a half, before sunset. What a glorious evening! and what a glorious scene for my enraptured eye! I saw every principal mountain in Scotland, from Ben More, in Balquhidder, to Ben Wyvis, in Ross-shire—every one of which I knew as well as the hills of Ettrick Forest. But the Grampian muse herself shall describe the scene, for it is far above the capabilities of the Ettrick Shepherd of the present day.

On grey M'Dui's upmost verge I stood,
The loftiest cone of all that desert dun;
The seas afar were streamer'd o'er with blood,
Dark forests waved, and winding waters run;
For nature glow'd beneath the evening sun,
The western shadows darkening every dale,
Where dens of gloom, the sight of man to shun,
Lay shrouded in impervious magic veil,
While o'er them pour'd the rays of light so lovely pale.

But, O, what bard could sing the onward sight,
The piles that frown'd, the gulfs that yawn'd beneath,
Downward a thousand fathoms from the height,
Grim as the caverns in the land of death!
Like mountains shatter'd in the Eternal's wrath,
When fiends their banners 'gainst his reign unfurl'd—
A grizzly wilderness—a land of scathe!
Rocks upon rocks in dire confusion hurled—
A rent and formless mass, the ruins of a world.

As if by lost pre-eminence abased,
Hill behind hill erected locks of gray,
And every misty morion was upraised
To speak their farewell to the god of day;
When tempests rave along their polar way,
Not closer rear the billows of the deep,
Shining with silver foam, and marred with spray,
As up the midway heaven they war and sweep,
Then foil'd, and chafed to rage, roll down the broken steep.

First died upon the peaks the golden hue,
And o'er them spread a beauteous purple screen;
Then rose a shade of pale cerulean blue,
Softening the hills and hazy vales between—
Deeper and deeper grew the magic scene,
As darker shades of the night-heaven came on;
No star along the firmament was seen,
But solemn majesty prevail'd alone
Around the brows of eve, upon her Grampian throne.

Whenever I reached the top of Benmuichdhui, I saw decidedly that I stood upon the highest land in Britain. I had suspected as much for ten years previous to that, for I had often seen it from north, south, east, and west; and although it rose in the middle of the very highest range of the Grampians, I observed, from all quarters, that it still peered considerably above the rest—not much, but still so much as to show that it was the sovereign of them all. I affirmed from that day forth that it was the highest hill in Britain, and it is now proved by the trigonometrical survey, that my conjecture was right. I did, however, think that it was more elevated above Ben Nevis, in Lochaber, than it has turned out to be.

This was the sole survey that I got of "the infant rills of Highland Dee." I think I saw them all which form that branch which is the main one, and the one which keeps the line with the river. I saw no crystal lake such as you describe. None. Before Glen Garchary begins to form between the two mountains, there is a long rivulet comes from the west, which I thought rose near to the sources of the Tilt, in Atholl. It is joined by five or six smaller ones, and their united waters pour together into the chasm of the Garchary. The springs of Glen Aven likewise lay below our feet, and we had a good view of about one-half of that horrible wilderness. I saw no lake, and Finlayson did not mention any, and I think it must have been a very small one indeed, if I had not seen it in such an evening. But it may perhaps be the source of the eastern branch, Glen Guisachan, which I did not see, for reasons which I shall make perfectly obvious. The wildness of the scene had such charms for me, that I remained on the top of this sovereign of the Grampians till the close of evening.

At length night coming on, Finlayson led me into a cavern, which he had known when a deer-stalking. It could scarcely be called a cavern, for it was merely a little level spot overhung by a rock. It was bedded with fresh heather, and seemed to have been very lately occupied. We took a hearty and plentiful supper, and there being a spring close by, we drank plenty of grog of the very best. I thought I never tasted any grog or toddy so good in all my life; and it not having been the first of many hundreds of times that I had slept upon the mountains in worse circumstances, I wrapped myself well up in my shepherd's plaid, and slept as sound as I had been in a feather bed, resolved to see the sun rise from the top of Benmuichdhui.

"But pleasures are like poppies spread."

When we awoke early next morning, the tops of the mountains were all shrouded in a dark cloud of mist, and a drizzly rain had begun to fall, so that farther investigation in that elevated region was impracticable. We then stretched our course eastward, and crossed the Guisachan high up, keeping always high on the hills along by the fringes of the mist, for I had determined, if the mist cleared up before mid-day, that I would visit the top of Beinnie-Boord, a great mountain which rises above the Mar Forest; for I had a strange propensity, when young and able, that I could never pass by a very high mountain without being on the top of it; and, what you may think as strange, the sensations of pleasure I have always felt on being thus elevated on a fine day, have been about the highest I ever experienced. I believe it is generally allowed that the depression or elevation of a man's mind is in a great measure conformable to the disposition of his bodily frame. What, then, can contribute so much to the elevation of his sentiments as placing him on the top of a very high mountain; for the body being the throne of the mind, who can deny that a mind so highly elevated as to be placed on the summit of Benmuichdui is not far exalted above all the grovelling creatures beneath. I felt that I was far above a king, and would not have changed stations with one on earth. I was placed above huge masses of eternal snow, above the habitations of the fox and the eagle, and looking down on some of the most shaggy and stupendous ravines of nature.

Well, on we walked, and on and on, through as rough and rugged a country as can well be conceived, till at length we came into the head of a stream called Glenquoich, which we followed, until, near the confluence with the Dee, we came to the house of Mr James Stewart, factor to the Earl of Fife, who received me with great kindness, I having been there with a friend once before. There I remained several days, experiencing the utmost hospitality; but I was greatly mortified to find that he did not know that I was a poet: indeed, I am not very sure if he knew what a poet was; he was nevertheless a kind-hearted gentlemanly Highlander, one of the Atholl Stewarts. He introduced me to his lord, Earl Fife, who had just newly come to the Forest Lodge, along with his brother and a foreigner. We dined with them one day; but even *they* did not know or discover that I was a poet, notwithstanding I was introduced to them by name. I was received and entertained by them merely as Mr Hogg, a friend of Mr Stewart. This was very galling; but I have noted it a hundred times both in Edinburgh and London, that, when introduced to any family merely as Mr Hogg, I remained and went away without any one having the least idea who I was. I have often got apologies made to me afterwards; but never one recognised me as the Ettrick Shepherd, when so introduced, in my life. I have often wondered what sort of being they had supposed me to be. Knowing this to have been uniformly the case, I need not have been surprised at my reception on this more than at other times. I certainly would have liked to have been recognised by the Earl, and his brother General Duff (whom I liked exceedingly), as the Ettrick Shepherd; but I durst not for my life tell them, lest they should never have heard of my name.

On the third day that I was with Stewart, who seemed to have imbibed a real attachment to me, he furnished me with a nice pony, well accoutred, to ride to the top of Beinnie-Boord, giving my guide directions as to the route he was to take, which, if he followed, I would never need to alight. I never did; for though I gave him the pony time about, one of us rode all the way, and we reached the great broad top of Beinnie-Boord before mid-day; but we could see nothing: for though there was no mist, there was a sort of blue haze pervading the mountains, so that we could not see the very hills that were nearest to us. We saw plenty of red deer that day, and some fine stupendous fellows among them. We saw seventeen in one herd on the side of Beinnie-Boord, all walking deliberately in a string. We saw also a few eagles, some scores of ptarmigans, and whole fields on the height trenched in search of the Cairngorm topazes.

I left Mr Stewart's house on the Saturday, and retired again to my inn, Mr Watson's, in the Castleton

of Braemar. Mr Watson had one very fine sister, Katherine, into whose good graces I tried, with all my sassenach eloquence, to get, but could make nothing of her; she thought it excellent sport, but only laughed at it.

On the Monday morning I rose very early, and again took the hills with my guide, to visit the top of Ben Aven, which being in my opinion the highest next to Benmuichdhui, and the easternmost of the range, if we except Loch-na-gar, which can hardly be called on the same range, I expected a grand view to the east and north-east. This was the most fatiguing day's march of all; for we could not get up any glen, but across a district, down one steep precipitous hill and up another, till at last we arrived on the summit of Ben Aven, a little after mid-day. After all my toil I could see nothing; the same dim haze still wrapped the mountains as on the Friday before, so that we could only once see dimly the great mountain of Cairngorm, right over against us on the other side of the glen. It was, however, a curious and interesting scene; the ptarmigans were altogether without number—I think I may say thousands of them; and we found twenty-five men digging on the height for Cairngorm topazes and rock crystals of various kinds. We came to a cottage almost on the very height, thickly covered over with pitch, in which fifteen of them lodged; the rest shifted for themselves elsewhere. In one place we came to a field on the height, where there were upwards of twenty acres all trenched to a great depth; and it is well known that over all Scotland there are great blocks of granite lying, as if dropped down from heaven. Around all these, on the heights, the quarriers had digged to a great depth, until they met below them. They digged on two sides till they met, and then they propped these sides up with stones, and digged below the other two; and under and around these masses the crystals were always found plentiest and richest. The overseer and receiver, who was rather a sensible fellow, and an Englishman, said that he knew perfectly well, from the part of the stone that was above ground, what water the crystals would be of below it. It was his opinion that these Cairngorm crystals were what he called stalactites of granite, and had been distilled out of these rocks for ages, for that there was always a part of the granite adhering to their hinder part. He showed me a great number of various colours. They were regular hexagonal prisms, tapering to a very narrow point. He showed me, likewise, sundry specimens of a curious long irregular fossil, of a hazel colour, which he called asbestos, or some such ridiculous name. He was very proud of having got so many of them, and alleged that no man in the country knew where to find them but himself. He assured me, farther, that they were indissoluble either by fire or water, and that they could be converted into cloth, over which the fire had no power. I always think he must have been lying.

We reached Castleton at a late hour very wearied, and loaded with grand Cairngorm stones which we had gathered in the ravines of the mountains. I found Mr Stewart come down there to meet me and take a parting glass with me, and he and Mr Watson laughed heartily at my hoard of rich crystals, and made me throw them all into the Clunie, save six or seven, which I absolutely refused to part with. Thus terminated my only expedition to the springs of the Dee; but there was one view which I got of Glen Garchary which has left an impression of horrid grandeur on my mind never to be effaced.

THE YOUNG CHEMIST—No. IV.

We shall now proceed to consider each chemical substance in succession, and we shall begin with the *gases*. The word gas, however strange and scientific it may sound, means nothing more nor less than the English word air. As air, however, is the generally understood name for the atmosphere, chemists employ the term gas for all other kinds of airs. Gases, or airs, then, are very important substances with chemists, however trifling they may appear to other people. When a chemist shows you a phial apparently empty, it is not so in reality; it is filled with air, either that of the atmosphere, or of some other colourless and invisible gas. If he takes a phial filled with water, and pours it out, he does not imagine that he has emptied the phial; he has only emptied it of water, while a corresponding bulk of air has pressed in to supply the place of the fluid. If, instead of emptying the phial in the common atmospheric air, he has done so in a jar of any other gas, he can cork up the phial, and lay it aside, and, under certain circumstances, preserve it just as well as he could do any liquid or solid substance. By means of an air-trough and a bent glass tube, the chemist is in the daily practice of transferring or pouring a gas from one vessel to another, with as much precision and nicety as a little water can be poured from one vessel to another. This much it was necessary to say respecting the weight and importance of the gases, lest the uninformed might treat them as light matters. Now we shall proceed to consider *oxygen gas*, perhaps the most important and universal substance in nature. Although it is to be found every where, in the atmosphere, in the water, and on the earth, yet do not send to a laboratory for a pennyworth of it, as we have seen young chemists at their first outset do—it is not kept there; but we shall describe to you how it is made: when we say *made*, however, we only mean procured. Many substances contain it, and it is the business of the chemist to separate and extract it from these. Common nitre, or saltpetre, contains it in abundance, and one of the easiest ways of getting it is from this substance. Take an earthen retort, or a glass one coated with clay, or an old gun-barrel, with the touch-hole carefully closed up, and put in a few ounces of the nitre in powder; then expose the vessel containing it to a strong red heat, and in a short time oxygen gas will flow out at the opening of the retort or end of the gun-barrel. This gas is to be collected by tying the mouth of an empty bladder over the retort, or it may be collected in phials filled with water, and placed upon the shelf of the air-trough already mentioned. This air-trough consists of a water-tight box, of a round or square form, made generally of tin-plate, open above, and having a shelf, pierced with three or four holes, laid across the box, two inches from the brim or margin. The box is to be filled with water till it reaches above the shelf; and when jars or phials are to be charged with gas, they are first filled with water, and placed on the shelf with the open mouth downwards; in this way, by being immersed in the fluid, they remain filled with water till the gas is introduced from the hole below the shelf, which ascending, from its lightness, gradually fills the phial, and displaces the water into the trough. Another mode of producing oxygen, is, to put into a common glass retort* two ounces of black oxide of manganese, and one ounce of strong sulphuric acid: apply heat, and the gas will be set at liberty. Now, having procured it, we shall next examine its nature. It is a light substance, without any sensible colour, taste, or smell; it is elastic, like all airs; that is, it can be pressed into smaller bulk by a weight or pressure on it, but on this being removed it regains its former bulk: this it will do under all circumstances, and hence it and other airs have been called permanently elastic. But what renders oxygen gas famous is, its power of supporting animal life. It forms a fifth part of the air we breathe, and without its pressure we could not exist for half an hour. All animals, in some way or other, breathe it, or take it into their bodies, and hence it has got the name of vital air. By this breathing, it is taken up by the lungs into our blood; and if a man or animal were confined into a small space, so that he had only a limited supply of air, the moment he had exhausted all the oxygen, he would begin to gasp and pant, and in a very short time would die like one suffocated. Oxygen is also necessary for the support of combustion, or the burning of inflammable substances. It is from a constant current of this gas going to our grates that the coals blaze out and afford heat and light; for without free access to air, and a supply of oxygen, no substance will continue to burn. Now, pure oxygen, such as may be collected in a jar or phial, makes substances burn much brighter than they will do in the common air, which, as we have said, contains only a fifth part of this gas. If you take a small taper or candle, and tie it to a wire, and dip it into a jar of oxygen, you will perceive the light immediately to become ten times more brilliant than before. If you blow out the flame, and immediately immerse it, the taper will rekindle with a sudden burst of flame; but as the gas in the jar is gradually consumed, the brilliancy of the flame ceases, and at last the taper is extinguished when no more oxygen remains to feed it. If a bit of phosphorus be put into a jar of this gas, and set fire to with the point of a red-hot wire, the flame is of the most dazzling brightness. Such is the power of oxygen in promoting combustion, that even metals may be burned in it. Thus, instead of the taper, if you introduce a piece of thin iron wire coiled up, with a small bit of lighted charcoal or touchwood on one end, it will burn with a bright light, throwing out a number of brilliant sparks. A little sand should be put into the bottom of the phial, otherwise the intense heat of the iron will crack and melt the glass. In this instance, the oxygen unites with the metal, and forms a brown oxide of iron; and as a proof that the gas is thus consumed, if, when introducing the wire you cork up the jar at the top, so as to prevent any air from rushing in, you will find, that, after the combustion, if you reverse the phial into the water-trough, and take out its cork, the water in the trough will be forced up by external pressure, to supply the place of the oxygen. In all cases of combustion or burning of bodies, then, the oxygen enters into some new combination with these, and disappears as a gas. But it may be asked, if oxygen is thus so necessary for animal life, and for the combustion of inflammable bodies, why is not the atmosphere wholly composed of it? To this we reply, there is such a case as having too much of a good thing. A little dash of vinegar, or mustard, or pepper, heightens the relish of our dinners; but what stomach could endure a full meal of either of these substances alone? If we lived in an atmosphere of pure oxygen, our existence would be a short fever of a few days, or it may be hours. In breathing pure oxygen, the pulse acts quick, the chest is tight and contracted, the countenance florid, flushed, and excited, and, in short, all the springs of life are so pushed on and stimulated, that they would be fatigued and destroyed in the space we mention. It is the same with combustibles: every thing on the earth would blaze out in vivid flame, and exhibit a glorious bonfire for a few days; but then they would be consumed, and nothing would remain but barren sterility. To temper this power of oxygen, therefore, other four parts of a gas, of quite a different nature, is mixed with the atmosphere, which has neither the property of supporting flame nor animal life: this gas is called *nitrogen*, and we shall come to speak of it afterwards.

We have already stated that oxygen is universally diffused throughout all nature: it forms part of the air, the greater part of water; enters into the composition of solid rocks; and, in short, is met with in almost every mineral body, as well as in vegetable and animal substances. In its combination with certain bodies, it produces substances which have a sharp acid taste; hence oxygen first obtained its Greek name, which signifies the generator of acids: we shall find, however, that it is not the only substance which is the cause of acidity.

We now proceed to describe another air, called *hydrogen gas*. As oxygen was remarkable for supporting combustion, so hydrogen is no less so in being a highly inflammable substance itself, although it has not the power of supporting flame, or of sustaining animal life. Hydrogen is not quite so prevalent a substance as oxygen, although the circumstance of its entering into the composition of water renders it easy at all times to be procured, and this is done in various ways by decomposing water; that is, by separating this fluid into the two gases of which it is formed. We have already alluded to a method of decomposing water, by passing this fluid, in a state of vapour or in drops, through a gun-barrel, heated red-hot in the middle by placing it in a furnace of coals: in this way the hot iron of the barrel takes up the oxygen of the water, and sets the hydrogen at liberty, which may be collected at the end of the barrel. But the easiest mode of procuring hydrogen is this: Take a retort, furnished with a glass stopper above, and put into it an ounce of iron filings, such as may be procured at any smith's or artizan's workshop; add to this four ounces of water, and then pour in gradually one ounce of sulphuric acid. An action immediately commences between the substances, and a bubbling of air is perceived: this is hydrogen gas, which, if the glass stopper is put in, will pass over by the mouth of the retort, and may be collected by means of jars and the air-trough already described. If a retort is not at hand, a simpler apparatus still may be used, such as a strong phial with a wide mouth, into which put the ingredients as above, and then fix a glass tube into a cork, and put it into the phial; the gas will escape by the tube, and may be collected by tying a bladder on it; or if the tube is bent like the letter S, it may be used in the air-trough. If a taper be put to the end of the glass tube, after the mixture has been some time in the phial, the hydrogen will inflame, and continue to burn as long as the action within continues: as a mixture of hydrogen and common air explodes with some force, care should be taken that no common air remains in the bottle when the taper is put to the tube; and as a farther security, the whole apparatus of the bottle should be rolled round with a coarse cloth. The hydrogen thus procured has usually a strong smell, which is owing to some sulphurous vapours from the iron; for hydrogen, when pure, has neither colour, taste, nor smell. It is the lightest body in nature, being sixteen times lighter than oxygen, and about fourteen times lighter than the common air. It is from this property that hydrogen has been used for filling balloons. If soap bubbles are blown up from a bladder of hydrogen, instead of being filled with air from the lungs, they will mount perpendicularly upwards; and if instead of these a very thin bag of glazed silk be inflated, we have a common balloon, which, being filled with a substance greatly lighter than the surrounding air, mounts upwards just in the same manner as a cork, when set at liberty at the bottom of a basin of water, bounds, from its lightness, immediately to the top. Balloons of larger size are now generally filled with the common coal gas, which, though not so light as pure hydrogen, is yet sufficiently so as to render a large bag lighter than the air of the atmosphere. To show that hydrogen is incapable of supporting flame, you have only to take a lighted taper and introduce it into a jar of this gas, with the open mouth downwards; if this is done quickly, a slight flame is produced in the gas immediately at the mouth; but whenever the taper is fairly plunged into its middle, the light is extinguished. A mixture of hydrogen and oxygen gases explodes with considerable force; and if the combustion is slowly brought about in a jar, drops of water will be found trickling down its sides, which shows that, however incredible it may appear, the common fluid water is a compound of two airs, or of eight parts of hydrogen to one part of oxygen. Exploding the two gases in bottles is rather dangerous, but if you take two parts by bulk of hydrogen, and one part oxygen, and introduce them into a bladder with a tobacco-pipe stalk at the mouth, the moment a taper is applied, the bladder will burst with a loud report. If managed in a different way,

* A retort is a pear-shaped glass vessel, drawn out to a tube at one end, and bent at the other, so as to form a vessel fit for distilling any substance when placed over a sand heat or spirit-lamp: they may be got at any glasshouse or chemist's.

the mixture of these gases may be made to produce the most intense heat and light that has ever yet been witnessed. An apparatus for this purpose has been invented, called the *oxi-hydrogen* blowpipe. It consists of a strong copper box, into which the proper mixtures of the gases are introduced by a forcing syringe: there is then a small tube at the top, with a stop-cock, through which the gases pass to become inflamed; but to prevent all danger of explosion, a contrivance of several folds of wire gauze is introduced between the tube and the box—exactly on the principle of the safety-lamp of Davy—by which the communication of the flame to the gas beyond the tube is effectually prevented. With this powerful flame, almost every known substance may be melted. A piece of iron is instantly liquified, and dispersed in brilliant sparks of fire; and even many of the refractory earths that remain untouched by the heat of ordinary furnaces, give way before it. A ball of chalk placed in this flame becomes so intensely heated as to give out a dazzling and overpowering light, which may be seen at the distance of many miles; and this is the contrivance proposed to be adopted in lighthouses for warning ships at sea. Hydrogen is also employed by means of an ingenious apparatus for affording an instantaneous light, which is now very generally employed in places where a taper is frequently needed. It has been found that one of the metals called platinum, when prepared in a certain way, so as to become of a spongy texture, has the property of becoming red hot on exposure to a stream of hydrogen gas. An apparatus is therefore constructed which affords a constant supply of this gas, and, by simply turning a stop-cock, a light is procured from the glowing platinum. Hydrogen is found entering largely into the composition of many bodies. It exists in all animal and vegetable matter; and when they are in a state of decay or decomposition, it is given out in considerable quantity: thus, in low lying marshes, full of decaying vegetables, hydrogen is always found, and, combined with other airs, most probably gives rise to the peculiar unwholesome *malaria* of many countries. It also forms parts of sugar, spirituous liquors—as brandy, gin, whisky—and indeed of every substance, more or less, that is derived from the vegetable kingdom. In short, it is the peculiar province of chemistry to show that all substances, however different they may seem from each other, and however opposite may be their properties, are all compounds of two or more of the substances which have been called simple, many of which are reckoned so, probably because chemistry is not yet so perfect as to show that even they are not compound. Among these substances, oxygen and hydrogen are ranked, because, however many combinations they enter into, they themselves cannot be separated into any thing more simple. Hydrogen derives its name from two Greek words, which signify the generator or former of water.

DANGERS OF CIRCUMSTANTIAL EVIDENCE.

In an early number of our Journal we took occasion to bring forward an article on the nature and tendency of circumstantial or presumptive evidence, as admitted by the Scottish criminal laws in cases of accusation for murder. We then gave a very remarkable instance where a concatenation of circumstances, apparently trifling and unimportant when viewed separately, yet, taken together, formed a chain of evidence which led to the discovery of the guilty person with almost the certainty of ocular testimony. At the same time we promised to give, in a future paper, a counter instance, where circumstances, all tending to bring home guilt to the person accused, and so construed and acted on by the dispensers of the law, had nevertheless been afterwards found to be deceptive, and to have brought down the penalty of guilt on the innocent head. Various causes have contributed to delay our fulfilling this promise; but chiefly from our wish to procure an example where the incidents were of as interesting a description as possible.

The first case we shall notice is one recorded by the celebrated Sir Edward Coke, in his great work, his Commentary on Littleton, which is said to have occurred in the eighth year of the reign of James the First of England.

In the county of Warwick, there lived two gentlemen, brothers, one of whom was possessed of considerable landed property. He had only one child, a daughter, the charge of whom he by his will devised to his brother, until she should attain the age of sixteen years, when she became entitled to take her property into her own hands. The uncle, after his brother's death, discharged the duty of guardian, to all appearance with great care and fidelity, until his niece reached her eighth or ninth year, having her instructed in all the accomplishments proper to her age and station. About that period, it happened one day that in consequence of some real or supposed juvenile misdemeanour, the uncle thought himself called upon to inflict a little personal chastisement on his niece, on which occasion the child was heard, by some of the servants, to exclaim, "Oh! good uncle, do not kill me!" Next morning the child was amissing, and notwithstanding a strict and immediate search was instituted, no traces of her could afterwards be obtained.

From the incident just mentioned, together with the circumstance of the uncle's being the immediate heir to the estates of his lost niece, suspicion naturally fell on him as the supposed murderer. He was apprehended, and committed to jail; but as there existed no direct proof of his guilt, nor indeed of the murder having been committed at all, the "justices of the assize (to use the words of Coke) admonished him to find out the child, and thereupon bailed him until the next assizes." As the time drew near for the fulfilment of this injunction, the uncle, who suspected what the consequences of his non-compliance would be, bethought him of a stratagem for deceiving the officers of the law. He procured a child from a distant quarter, resembling as nearly as might be, in years and appearance, the one that was amissing; and having attired her suitably, he produced her in court as his lost niece. The imposture was, however, discovered; the attempt was regarded as only a farther corroboration of the relative's guilt, and he was tried, condemned, and executed. Time rolled on without the smallest circumstance transpiring to raise a doubt of the justness of the punishment; but in about seven or eight years afterwards—that is to say, when the time arrived at which the girl supposed to be murdered, was, by the will of her father, entitled to claim her property—she, to the surprise of every one, made her appearance, and her identity being clearly ascertained, she was put in possession of her wealth. It turned out, that, early on the morning after being beaten by her uncle, as above mentioned, she was to have gone to attend a school in the neighbourhood; but, instead of proceeding thither, she fled across the country into a neighbouring county, where, from her intelligence, education, and interesting appearance, she was received into a gentleman's family upon whom she had imposed with some plausible story, the fear of being again discovered and claimed by her uncle no doubt inducing her to conceal her real name and situation. There she had resided until the period of her personal freedom had arrived, little dreaming, of course, of the fatal consequences of her flight and seclusion to her unfortunate relative. "This case," adds Sir Edward Coke, "we have reported for a double caveat; first, to judges, that they, in case of life, judge not too hastily upon bare presumption; and, secondly, to the innocent and the true man, that he never seek to excuse himself by false or undue means, lest thereby he overthrow himself as the uncle did."*

Sir Matthew Hale, in noticing the above case, and observations by his great predecessor, also mentions another melancholy instance which occurred, he says, in Staffordshire, within his own remembrance. An individual was suddenly amissing in his native place; and suspicion having fallen on a certain person as the murderer, he was apprehended and tried. So strong were the presumptions against him, not only of his having taken the man's life, but even of having afterwards consumed the body *in an oven*, that he was convicted and executed. Within a twelvemonth, however, the supposed victim returned, when it appeared that he had indeed been kidnapped, and sent across the sea against his will by the individual who had been executed; "and so," adds Sir Matthew Hale, "although he justly deserved death, yet he was really not guilty of that offence for which he suffered."

The above examples are sufficient to show both the perilous nature of presumptive evidence, and the undue extent to which it was formerly permitted to bear against the accused. It has accordingly since been recognised as an established principle, both in the law of Scotland and England, that *actual certainty of the murder being committed* must first be got at, ere presumption, however strong, be permitted to affect the innocence or safety of any individual. "I would never," observes the eminent lawyer last quoted, "convict any person of murder, or manslaughter, *unless the fact were proved to be done*, or at least the body found dead." Burnet, one of the greatest of our Scotch criminal law authorities, lays it down as "a leading and indispensable rule, in judging of presumptive evidence, in no case to admit of its effect, unless there be proof of the *corpus delicti*. Till it be proved that a crime has been committed, it is in vain to inquire whether this or that circumstance ought to have any effect against the party accused. Till it be proved that a murder has been perpetrated, it is in vain to inquire whether a particular individual has been guilty of it."

Although a man's life, however, may thus, in such cases, be protected by the scrupulous jealousy of the law, it is impossible to guard his character from suspicions, which may so affect his circumstances and peace of mind as to render mere existence a boon little to be envied; and we shall now detail to our readers a peculiarly affecting instance of this nature, where the undoubted proof of innocence only arrived after the unfortunate individual had underlain the horrid imputation of murder for many years, and had in consequence been reduced from comfortable circumstances, and a respectable station in society, to a state of unpitied poverty and distress. The individual we allude to is still alive; and the truth of the narrative will at once be recognised by the inhabitants of the district where the circumstances took place.

It is now about 25 years since, that, on the evening of a market-day at a burgh town in the south of Scotland, a party of four or five individuals were returning together to their domiciles in the country. They were on horseback, and all farmers, with the exception of one, who was a drover or cattle-dealer. The conversation, of course, naturally turned on the market they had been attending, which happened to be an unusually brisk one, and, as most of them had been sellers, their spirits were proportionably high. The cattle-dealer, especially, seemed to be in a remarkably voluble and sanguine humour—spoke freely of his gains by the day's sales—mentioned his intentions of proceeding directly to a large southern fair that was approaching, in order to make purchases to the amount of several hundred pounds; and even, in the heat of his animation and confidence, produced a large pocket-book, boastingly observing that it contained ample funds for the purpose. There was nothing in all this to excite any surprise in his companions, with the exception of one circumstance, that the affairs of the drover, it had been generally surmised for a considerable time past, were by no means in a flourishing condition. These rumours, however, might be false; besides, one lucky hit in the market, they all knew, might at any time change the tide of a man's fortunes.

These cattle-dealers, while travelling in their vocation, seldom, as is well known in agricultural districts, need to pay for their night's quarters in any part of the country where they are at all known—their company being always welcome at the farmer's fireside for the information they bring respecting the state of distant markets, the chance of driving a bargain with them, &c. &c. It was but natural, therefore, that the individual we now speak of should receive an invitation to supper and bed for the night from one of his companions, on arriving at the cross road which turned off the highway towards the house of the latter. This, indeed, was uniformly his home while sojourning in that district, from the great intimacy which subsisted between the farmer and himself. The offer, however, was in the present instance at first declined, and they bade each other good night; but, after riding on a little distance with the remainder of the party, the dealer seemed to regret having done so—spoke of the quantity of money he had about him—the prudence of taking daylight for his journey—his being a good deal wearied—and, finally, turned his horse's head, declaring his determination of overtaking his friend, which he could do in a few minutes, and stopping with him all night.

Next morning the dealer's horse was found by some of the farmer's servants, straying about the barn-yard, saddled and bridled. They at first thought little of it, concluding that the owner had come home with their master, who, from the early hours kept in the country, had arrived after the household had retired to rest on the preceding evening. But when this was found not to be the case, fears began to arise of some accident having happened. Inquiry was immediately made throughout the neighbourhood, but to no purpose; while another circumstance took place during the day which led to suspicions no way favourable to the occupant of the farm-house. A dog belonging to the drover had by some means found its way thither, and getting under the bed where its master usually slept, it kept up a continued howling in that long melancholy cadence in which dogs are popularly supposed to display their instinctive consciousness of recent or approaching death. This it continued to do for several days, resisting all inducements to quit its post; and it was at last necessary to use main force to get it out. Every field in the district was then scoured; ditches and quarries were searched; ponds, pools, and wells were dragged—but all in vain. A wood of some extent in the vicinity was hunted again and again by a pack of hounds belonging to a nobleman, which were then in that quarter, in order to discover the dead body—but still to no purpose. The public interest grew gradually stronger. Intelligence of the mysterious event soon reached the public authorities, and a strict investigation was set on foot. The individuals who accompanied the unfortunate man on the night preceding his disappearance, and who resided in different parts of the country, came forward, and their testimony agreed in every particular—the large quantity of money he said he had about him—the manner in which he meant to dispose of it—the invitation given him by their brother farmer—his declining, and afterwards returning to accept of it—his perfect sobriety—in not one tittle was there the slightest discrepancy in their evidence. The farm-servants declared their uncertainty as to the time of night when their master arrived at home on the evening alluded to, which seemed to imply caution on his part in entering the house—the strange situation in which the dealer's horse was found next morning—the still more strange conduct of the dog—and their master's evident agitation throughout the subsequent search. The latter himself, when interrogated, either could or would say nothing beyond solemnly declaring his utter inability to account for the disappearance of the man, whom he had not seen, he said, from the time he parted with him on the highway in company with the others: he had ridden slowly home, so that any one wishing to overtake him could easily have done so. As to caution on entering his house, he made it

* Coke's Pleas of the Crown, cap. 104.

a rule, he said, never to disturb any of the family, should they have gone to bed, on his return from market or elsewhere, but to dress and supper his horse with his own hands; and the latter statement was confirmed by the testimony of his family.

All this might be true, but was nevertheless far from satisfying the public mind. The farmer was universally looked upon as being in some way or other connected with the disappearance of the absent man; but as no trace of the drover or his property could be discovered about his dwelling or premises, he was allowed to go at liberty. But his freedom, and even his tacit acquittal in the eye of justice, was now of little benefit to him. The brand of the murderer was stamped on his character. By most men he was looked on as decidedly guilty; by many he was regarded with doubt; and, in fact, the presumptions were so strong against him, that even those who disbelieved them, being unable to urge any thing in his exculpation beyond their own secret conviction of his innocence, at last held their peace. Let no man presume to despise public opinion. Its power in this instance was fearfully, though wrongfully, shown. He was shunned every where. On the highway, his former friends avoided him. At market, no one would either buy from or sell to him. The consequences of all this were soon visible. He lost heart; got behind with his rent; his effects were rouped off; in short, he became a "broken" man.

Years rolled on, and this *victim of presumptive evidence*—for such he still was—gradually sunk to a state of poverty and desertion; for even after the infirmities of age overtook him, people scrupled to lend their assistance to the *supposed murderer*. At last, by the interest of some individuals less suspicious or more charitably disposed than others, he was enabled to rent a toll-bar in his native county. In this situation he had continued for several years, when a rumour reached the district that the drover had been seen in America by a young man who had recently emigrated from that part of the country. The report, however, was so vague, that it was generally discredited; and not being afterwards confirmed, the old man still continued to lie under the horrid suspicions against him. But justice was doomed to be done to his character at last. One day, while sitting in his toll-house, an individual entered, and, without speaking a word, seated himself in a chair opposite to him. The man was seemingly in the extremity of poverty, but his hat was so much slouched over his features that they could not be seen distinctly. To the inquiries of the old man, whether or not he was ailing, he continued silent for some time with his eyes bent on the ground, but at last looked up in the other's face, and lifted his hat. It was the drover!—the man who had been amissing for more than a dozen years, and whose mysterious disappearance had been the occasion of all his misfortunes. After gazing on each other for some moments in silence, the one doubtful whether a ghost or a living man stood before him, and the other seemingly agitated with strong feelings of shame and contrition, the latter stretched out his hand, and asked the old man if he could forgive his worst enemy. The latter knew not what answer to make to this address, and few more words, indeed, passed between them, for a sudden conviction of the truth at once flashed on the old man's mind, which was confirmed by the guilt-speaking silence of the other. The following, we believe, is the true account of the drover's story:—About the time of his disappearance, he had become deeply involved in extensive bill transactions, and these, together with several severe losses in trade, placed the alternative before him, of either absconding with what money he still possessed, or of remaining to be stripped of every farthing, and thrown into jail. He determined on the former course, and, to prevent pursuit, devised the horrible contrivance—which, as we have seen, he too successfully executed—of throwing the imputation of his murder on some one. After abandoning his horse near the farm-steading of his victim, he fled to the hills, and traversed the country by the loneliest paths, to a distant sea-port on the Solway, whence he got across to Liverpool, and there took shipping for America, in a vessel which he had previously ascertained was on the eve of sailing. He was fully determined, he said, to return when he had made sufficient to satisfy his creditors; but his energies were blighted—nothing throve with him. He often seemed in a way of becoming rich, but some unexpected misfortune always destroyed his hopes. He was at last utterly ruined, lost his health, and was unable to work; and, finding himself, as he thought, dying, he procured a free passage in a homeward-bound vessel, in order, he said, to ask forgiveness of the man he had wronged so much, without which, he declared, he could not die in peace. On being asked why he did not prevent all that wrong by sending home some notification of his being alive, he alleged his fears of being pursued by some of his creditors. But it was too evident, from his manner, that this tardy reparation was not prompted by real contrition, but rather by the cunning of despair, and that, had he succeeded in his pursuits abroad, there would have been little probability of his ever returning to repair the mischief, both to character and property, he had perpetrated by his absconding. The old man saw this, and only saying that he forgave him, and prayed God to forgive him also, desired him to leave the house, and never vex his eyes with his presence more. The wretch, accordingly, departed. He lived many years afterwards in the same district; and although generally loathed and despised, yet, strange to say, he found much less difficulty in supporting himself comfortably than the poor man he had ruined by treachery.

It is at once with shame, surprise, and regret, that we have to conclude this melancholy story by stating, that the injured old man has been suffered to drag on his existence unnoticed, in that poverty and obscurity to which the crime of one, and the mistaken suspicions of the many, so undeservedly reduced him. Private charity may have done something to smooth his declining years; but we think—and we are confident the world will think with us—that the poor man who thus fell a victim to mistaken public prejudice, was, in common fairness, entitled to a reparation as public as the injury. Let us hope it will yet be done.

BIOGRAPHIC SKETCHES.

DR THOMAS BROWN.

This distinguished modern philosophical writer, whose biography is intimately connected with the literary reputation of Scotland, was the son of the Rev. Samuel Brown, minister of the parish of Kirkmabreck, in the stewartry of Kirkcudbright, and was born at the manse of that parish, January 9, 1778. Deprived of his father when between one and two years old, Thomas Brown was conveyed to Edinburgh, where for some years he lived under the charge of his widowed mother. By her he was taught the elements of learning at a singularly early age, acquiring the whole alphabet, it is said, by one effort, or, to use other words, in one lesson, and every thing else with the same amazing facility. When between four and five years of age, he was able to read the Scriptures, and also, it would appear, partly to understand them. One day, at that period of his life, he was found sitting on the floor of his mother's parlour, with a large family Bible on his knee, which he was dividing into different parts with his hand; being asked jocularly if he intended to preach, and was now choosing a text, he said, "No, I am only wishing to see what the Evangelists differ in; for they do not all give the same account of Christ." From the kindly tutelage of his mother he was removed in the seventh year of his age, and placed by his maternal uncle, Captain Smith, in a school at Camberwell, from which in a short time he was transferred to one at Chiswick, where he continued for some years. In these and two other academies he spent the years between seven and fourteen, and acquired a perfect classical education. In 1792, he returned to the maternal roof at Edinburgh, and commenced a course of attendance at the University.

At this period of his life he was deeply read in the English belles lettres, and had even collected a considerable library, which, however, was lost at sea in its passage from England to Scotland. Having gone to Liverpool to spend the vacation of 1793 with some friends, he became, boy as he was, the intimate friend of Dr Currie, the amiable biographer of Burns, who is believed to have been the first cause of his directing his mind to metaphysical studies, by placing in his hands the first volumes of Professor Dugald Stewart's "Elements of the Philosophy of the Human Mind," then just published. The impressions he received from this work were deepened next winter, when he attended its author's prelections in the moral philosophy class at Edinburgh College. Yet, much as he admired Professor Stewart, he did not fail, even at the early age of sixteen, to detect that deficiency of analysis which often lurks under the majestically flowing veil of his language and imagery. According to the Rev. Mr Welsh, whose very pleasing memoir of Dr Brown is here followed, the scholar took an early opportunity of presenting to his master a few remarks which he had thrown together in reference to one of his theories. "Those who remember the dignified demeanour of Mr Stewart in his class, which was calculated to convey the idea of one of those great and gifted men who were seen among the groves of the academy, will duly appreciate the boldness of our young philosopher. With great modesty he read his observations; to which Mr Stewart, with a candour that was to be expected from a philosopher, but which not the less on that account did him infinite honour, listened patiently, and then, with a smile of wonder and admiration, read to him a letter which he had received from the distinguished M. Prevost of Geneva, containing the same argument which Dr Brown had stated." This delightful incident was the commencement of an acquaintance between the master and the pupil, which led to more intimate relations, and only ended with the death of Dr Brown. The varied and profound acquirements of this extraordinary young man soon attracted to him the attention and friendship of many other personages, distinguished by academic rank and literary reputation, especially Professors Robison, Playfair, and Black, and Messrs Horner, Leyden, Reddie, and Erskine. Ere he had completed his twentieth year, he was led, by the spirit of philosophical inquiry, to write "Observations upon Dr Darwin's Zoonomia," in a pamphlet which far surpassed the work which had called it forth. It appeared in 1798, and, while it excited astonishment in those who knew the years of the author, was received in other quarters as the work of a veteran in philosophy. Mr Welsh justly characterises it as one of the most remarkable exemplifications of premature intellect which has ever been exhibited, and states that, though unfortunate in its object, and the exposure of an unworthy production, it is found to contain the germ of all Dr Brown's subsequent discoveries as to mind, and of those principles of philosophising by which he was guided in his future inquiries.

Dr Brown at this time belonged to an association of young men, which, whether from its peculiar object, the celebrity since acquired by several of its members, or *one remarkable result* of its existence, must be acknowledged as possessing no ordinary claims to attention. It was called the Academy of Physics, and its object is described in the minutes of its first meeting to have been, "the investigation of nature, the laws by which her phenomena are regulated, and the history of opinions concerning these laws." The first members were Messrs Brougham, Erskine, Reddie, Brown, Rogerson, Birbeck, Logan, and Leyden; to whom were afterwards joined Lord Webb Seymour, the Rev. Sydney Smith, and Messrs Horner, Jeffrey, and Gillespie. The Academy prosecuted its investigations with great assiduity and success for about three years; like many other clubs, the spirit in which it was originated began to change with the changed years and altered views of its members; it flagged, failed, and was finally broken up. The remarkable result of its existence, above alluded to, was the establishment of the Edinburgh Review: a work which has done more to attract attention to Scotland, from alien and distant minds, than perhaps any other, except the series of what are called the Waverley novels. The first writers in this work were Messrs Jeffrey, Brougham, Sydney Smith, Horner, and Brown. The leading article of the second number, upon Kant's Philosophy, was by the last of these gentlemen. Mr Brown, however, did not long continue to contribute; a misunderstanding with the gentleman who superintended the publication of the third number, regarding some liberties taken with one of his articles, was the cause of his retirement.

It is curious to trace the varied destinies of the bright minds which composed the Academy of Physics. At the time when this memoir is written (July 1831), Brougham is Lord Chancellor of England, not only by form and ceremony the first subject of the realm, but also, by virtue of his transcendant abilities, and the concurrence of circumstances, the dominant intellect of the land: Erskine, with taste and talent, has remained in the condition of a private gentleman: Mr Reddie, whose philosophic spirit and excellent sense might have fitted him for a more brilliant lot, became an advocate, and in that capacity, we believe, acts as the assessor or legal adviser of the city of Glasgow: Brown, after a splendid career, has sunk into a premature grave: Birbeck has attained the highest reputation as an expositor of practical science: Logan, by a fortune astonishing to his fellows, but not dishonourable to himself, has devoted his excellent faculties to the duties of a parish clergyman in Scotland: Leyden, Horner, and Gillespie, men who gained, in their various walks, more or less distinction, are consigned to the land of forgetfulness: Sydney Smith is, like Logan, a clergyman, and has sent forth from his parsonage in England many a brilliant article for the Edinburgh Review: and lastly, Jeffrey has just retired from the editorship of that work, which he had conducted for a quarter of a century, to assume the duties of a political character, the highest that he could bear within his native country.

Brown's first ideas as to a profession led him to choose the bar, and for a twelvemonth he prosecuted the dry studies of the law. An insurmountable repugnance, however, to this pursuit, caused him afterwards to study medicine. He obtained his degree of M. D. in 1803, on which occasion he was honoured with the highest commendations from Dr Gregory, not only for his proficiency in medical learning, but for the amazingly fluent and elegant style of his Latinity, of which no one could judge better than that learned professor, himself acknowledged to be the best Latinist of his time in Scotland. Previous to this period, namely, in 1800, when he was only twenty-two years of age, his friends had, unsuccessfully, endeavoured to obtain for him the chair of rhetoric; but a system by which the clergy of the university-seat were almost invariably preferred to the vacant chairs, blasted his hopes on this occasion.

Upon the promotion of Mr Playfair to the chair of natural philosophy, Mr Leslie competed for the vacant chair of mathematics, with a clergyman whose attainments in that study, though more than respectable, certainly could not be placed on an equality with those of the opposing candidate. The church party, knowing that they could not make out any superior qualifications in their candidate on the score of mathematics, endeavoured to produce the same effect by depreciating Mr Leslie's qualifications on the score of religion. Their proof lay in a note to Mr Leslie's Essay on Heat, containing an expression of approbation respecting Hume's doctrine of causation. The canvass, which lay in the Town Council, was the cause of great excitement in the literary world, and for some time absorbed every other topic of discourse in Edinburgh. Dr Brown was tempted by his feelings on this subject to come forward with an essay, disproving the inferences which were drawn from Mr Leslie's note; an essay which, in a subsequent edition, he expanded into a complete treatise on cause and effect. Through the influence of this powerful appeal, and other similar expressions of public feeling, the patrons of the chair were shamed for once out of their usual prac-

tice, and Mr Leslie received the appointment. Dr Brown had before this period published two volumes of miscellaneous poems, which, though they did not meet with brilliant success, are yet to be admired as the effusions of an ingenious and graceful mind. In 1803, immediately after receiving his diploma, he began to practise as a physician, and he had hitherto met with considerable success. He was now (1806) taken into partnership by Dr Gregory, and for some time his attention was occupied more exclusively by his profession than was at all agreeable to one disposed like him to give up worldly advantages for the sake of a darling study. The prospect of an occupation more germane to his mind, opened up to him in the winter of 1808-9, when the state of Mr Stewart's health induced him to request the services of Mr Brown as his temporary substitute. The lectures which he delivered in this capacity attracted much attention, on account of his marvellous display of profound and original thought, of copious reading, of matchless ingenuity, and of the most admirable elocution; this last accomplishment having been acquired by Dr Brown in the ordinary course of his school studies. "The moral philosophy class at this period presented a very striking aspect. It was not a crowd of youthful students led into transports of admiration by the ignorant enthusiasm of the moment; distinguished members of the bench, of the bar, and of the pulpit, were daily present to witness the powers of this rising philosopher. Some of the most eminent of the professors were to be seen mixing with the students, and Mr Playfair, in particular, was present at every lecture. The originality, and depth, and eloquence of the lectures, had a very marked effect upon the young men attending the university, in leading them to metaphysical speculations."

The effect of these exhibitions was so great, that when Mr Stewart, two years after, expressed a wish to have Dr Brown officially conjoined to him in the chair of moral philosophy, the usual influence in favour of the clergy was overcome with little difficulty. From the commencement of the session of 1810-11, he acted as the substitute of Mr Stewart, who now retired to the country; and what is certainly very wonderful, he wrote the whole of his first course of lectures during the evenings which preceded the days on which they were delivered. After the first and most difficult step had been got over, Dr Brown obtained a little leisure to cultivate that poetical vein which had all along been one of his own favourite exercises of thought; and accordingly, in 1814, he published his largest versified work, entitled "The Paradise of Coquettes." As this poem appeared anonymously, its success, which was considerable, must have given him high gratification. He was, therefore, tempted next year to bring forth another, under the title of "The Wanderer in Norway." The health of Dr Brown had never been good; and it was now the annual custom of this amiable and gifted being to retire during the summer vacation to some sequestered and beautiful nook of his romantic native land, in order to enjoy the country air and exercise. Sometimes he would plant himself in some Swiss-like spot, hanging between Highland and Lowland, such as the village of Logie in Glendevon. At other times he would lose himself in the woody solitudes of Dunkeld. He had all his life a fondness for romantic and rugged scenery, amidst which he would occasionally expose himself to considerable risks. Walking was his favourite exercise, as he was thus able to pause and admire a rock, a wild-flower, a brook, or whatever else of beautiful presented itself. To his gentle and affectionate heart, one object always appealed with irresistible power—namely, a cottage smoking amidst trees: he never could pass a scene of that kind without pausing to ruminate upon the inexplicable sympathy which it seems to find in almost every breast. Though possessing a heart as open as day-light, the weakly health of Dr Brown, and the abstraction of his studies, seem to have checked that exuberant feeling which assumes the form called love: it is the impression of one of his surviving friends that he never experienced that sensation, at least to any extent worthy of the name. His affections were devoted to his mother, his sisters, nature, books, studies, literary fame.

In 1817, his feelings sustained a dreadful shock in the death of the former relative, who had been his first instructress, and to whom he bore an affection bordering upon reverence. Her remains were first placed in a vault in Edinburgh, and at the end of the winter session moved to the family burying-ground in the old church-yard of Kirkmabreck. This romantic and secluded spot Dr Brown had always viewed with great interest. A few years before, in visiting his father's grave, he had been altogether overcome, and when he saw the earth closing in upon all that remained of a mother that was so dear to him, "and the long grassy mantle cover all," his distress was such as to affect every person who saw him. In 1818, Dr Brown published a poetical tale, entitled "Agnes." But his reputation in this walk of literature was not on the increase. His mind by no means wanted poetical feeling and imagery, but he never could prevent the philosopher from intruding upon his warmest visions, and accordingly there is a decided tameness in all its verses. It may be said, that, if he had not been a great philosopher, he would have been a greater poet; and, on the other hand, if he had not attempted poetry, at least his *living* reputation as a philosopher would have been somewhat enhanced. Towards the end of 1819, the ill health of Dr Brown began to assume an alarming aspect, and early in the ensuing year he found himself so weak as to be obliged to appoint a substitute to deliver his lectures. This substitute was Mr John Stewart, another of the devotees of science, and, like himself, destined soon to sink prematurely beneath the weight of intellectual exertion. Of Brown it might truly be said, that an active spirit had worn out the slender and attenuated frame in which it was enshrined. At the recommendation of his physicians, he took a voyage to London, and established himself at Brompton, then a healthy village in the vicinity, but now nearly involved in the spreading masses of the great city. Here he gradually grew weaker and weaker, until the 2d of April, when he gently breathed his last.

"Among the more prominent features of Dr Brown's character (says his reverend biographer), may be enumerated the greatest gentleness, and kindness, and delicacy of mind, united with the noblest independence of spirit; a generous admiration of every thing affectionate or exalted in character; a manly contempt for every thing mean; a detestation for every thing that even bordered on tyranny and oppression; a truly British love of liberty, and the most ardent desire for the diffusion of knowledge, and happiness, and virtue, among mankind. In private life he was possessed of almost every quality which renders society delightful, and was indeed remarkable for nothing more than for the love of home and the happiness he shed around him there. It was ever his strongest wish to make every one who was with him happy; his exquisite delicacy of perception gave him a quick fore-feeling of whatever might be hurtful to any one; and his wit, his varied information, his classical taste, and, above all, his mild and gentlemanly manners, and his truly philosophic evenness of temper, diffused around him the purest and most refined enjoyment. Of almost universal knowledge, acquired by the most extensive reading, and by wide intercourse with the world, there was no topic of conversation to which he seemed a stranger. * * * In the philosophic love of truth, and in the patient investigation of it, Dr Brown may be pronounced as at least equal, and in subtility of intellect and powers of analysis, as superior to any metaphysician that ever existed."*

DIAMOND MINES OF BRAZIL.

Some years ago, Mr Mawe visited Brazil, in South America, and on his return to England published an account of his travels in that country. Among other interesting notices of places, he gives his readers a description of the mines from whence the diamonds are dug; and the mode in which these valuable stones are procured from the rubbish, or cascalhao, in which they are embedded, is curious, and worthy of attention. The diamond mines are situated on a river somewhat about the size of the Thames; and from the stream, aqueducts or canals are formed for bringing the water into the workings, to wash the diamonds. The process of washing takes place in troughs placed in the canals, and the operators are negro slaves, the property of individuals who let them out on hire for this species of labour, at the rate of about eightpence a-day. According to Mr Mawe—

"On the heap of cascalhao, at equal distances, are placed three high chairs for the officers or overseers. After they are seated, the negroes enter the troughs, each provided with a rake of a peculiar form and short handle, with which he rakes into the trough about fifty or eighty pounds weight of cascalhao. The water being then let in upon it, the cascalhao is spread abroad, and continually raked up to the head of the trough, so as to be kept in constant motion. This operation is performed for the space of a quarter of an hour; the water then begins to run clearer; having washed the earthy particles away, the gravel-like matter is raked up to the end of the trough; after the current flows away quite clear, the largest stones are thrown out, and afterwards those of inferior size; then the whole is examined with great care for diamonds. When a negro finds one, he immediately stands upright and claps his hands, then extends them, holding the gem between his fore-finger and thumb; an overseer receives it from him, and deposits it in a bowl, suspended from the centre of the structure, half full of water. In this vessel all the diamonds found in the course of the day are placed, and at the close of the work are taken out and delivered to the principal officer, who, after they have been weighed, registers the particulars in a book kept for that purpose.

When a negro is so fortunate as to find a diamond of the weight of an octavo (17½ carats), much ceremony takes place; he is crowned with a wreath of flowers, and carried in procession to the administrator, who gives him his freedom, by paying his owner for it. He also receives a present of new clothes, and is permitted to work on his own account. When a stone of eight or ten carats is found, the negro receives two new shirts, a complete new suit, with a hat and a handsome knife. For smaller stones of trivial amount proportionate premiums are given. During my stay at Tejuco a stone of 16¼ carats was found: it was pleasing to see the anxious desire manifested by the officers that it might prove heavy enough to entitle the poor negro to his freedom, and when, on being delivered and weighed, it proved only a carat short of the requisite weight, all seemed to sympathise in his disappointment.

Many precautions are taken to prevent the negroes from embezzling diamonds. Although they work in a bent position, and consequently never know whether the overseers are watching them or not, yet it is easy for them to omit gathering any which they see, and to place them in a corner of the trough for the purpose of secreting them at leisure hours, to prevent which, they are frequently changed while the operation is going on. A word of command being given by the overseers, they instantly move into each other's troughs, so that no opportunity of collusion can take place. If a negro be suspected of having swallowed a diamond, he is confined in a strong room until the fact can be ascertained. Formerly, the punishment inflicted on a negro for smuggling diamonds was confiscation of his person to the state: but it being thought too hard for the owner to suffer for the offence of his servant, the penalty has been commuted for personal imprisonment and chastisement. This is a much lighter punishment than that which their owners or any white man would suffer for a similar offence.

There is no particular regulation respecting the dress of the negroes; they work in the clothes most suitable to the nature of their employment, generally in a waistcoat and a pair of drawers, and not naked, as some travellers have stated. Their hours of labour are from a little before sunrise until sunset, half an hour being allowed for breakfast, and two hours at noon. While washing, they change their posture as often as they please, which is very necessary, as the work requires them to place their feet on the edges of the trough, and to stoop considerably. This posture is particularly prejudicial to young growing negroes, as it renders them in-kneed. Four or five times during the day they all rest, when snuff, of which they are very fond, is given to them.

The negroes are formed into working parties, called troops, containing two hundred each, under the direction of an administrator and inferior officers. Each troop has a clergyman and a surgeon to attend it. With respect to the subsistence of the negroes, although the present governor has in some degree improved it by allowing a daily portion of fresh beef, which was not allowed by his predecessors, yet I am sorry to observe that it is still poor and scanty; and in other respects they are more hardly dealt with than those of any other establishment which I visited: notwithstanding this, the owners are all anxious to get their negroes into the service.

The officers are liberally paid, and live in a style of considerable elegance, which a stranger would not be led to expect in so remote a place. Our tables were daily covered with a profusion of excellent viands, served up on fine Wedgewood ware, and the state of their household generally corresponded with this essential part of it. They were ever ready to assist me in my examination of the works, and freely gave me all the necessary information respecting them."

THE SAILOR'S ORPHANS.

We have much pleasure in noticing with commendation a volume, published in the course of last year, entitled "Real Life,"* in which are happily developed, through the medium of a series of simple stories and anecdotes, a variety of traits of character chiefly in humble life or among the peasantry of Scotland. The following, which is the opening piece, will be found to possess some natural and affecting touches:—

My first recollections of life are those of misery—my mother lying on her bed sobbing in wild grief—the house dark and desolate—my little sister and myself cold and hungry, and wailing, we knew not why, and no one caring for us. Perhaps all our distinct recollections of early life resemble pictures. They represent but one instant of time; and let us look back on them when we may, we always see the same people in exactly the same attitudes, the same dresses, the same expressions of face. At this moment, while I write, I see my mother stretched in an agony of grief upon the bed. I hear the convulsive fetches of her breath. I see the confused dreary apartment—the grate full of ashes, and no fire—an unwashed pan upon the hearth, with the lid half off, and covered with dust—a beam of cold pale light glinting down the chimney upon bits of broken plaster and half-burnt sticks, and think I yet feel the cold, damp, sooty air blow on my cheek. This last impression is so strong, that I have never since felt the same dismal blast but I thought it the very smell of desolation and despair.

The next picture that memory has presented is my mother sitting with her motionless wheel before her pale and motionless figure; her eyes gazing on vacancy, and the untwined thread suspended in her fingers. I see the outer door open slowly and softly, and light from a little black cruizie, which hung near the fire, fall full on the benevolent countenance, and the high,

white, unwrinkled brow of Simon the travelling merchant. He stood there a moment, looking on my mother, who did not perceive him. I see him still in my mind's eye stepping gently and silently into the house, and hear my mother's wild scream, when she at length observed him. He sat down by her, spoke to her kindly, and took my poor little alarmed and bewildered sister and myself on his knees, caressing us and giving us gingerbread from his great pocket. Few people are aware of the value of kindness of manner to a child, or how deeply a fond look, or word, or kiss, sinks into their little warm hearts in such situations as we then were. I was too young to understand what Simon or my mother were saying; but I remember her face turned upon us, her large dark eyes widely opened, and in a tone of agony uttering the words "wretched orphans." I did not know what that meant, but guessed it to be something very frightful. The slight and scattered glimpses of light thrown by my memory on a time so long past, only enable me to recollect, that from that night we were never again so unhappy. Simon saw my mother again, comforted her, and she began to work busily, and was once more occupied with the care of my sister and myself.

I now know that this dear mother was married, when a mere girl, to a young sailor, and that he perished in a great naval engagement, leaving an orphan widow, under twenty years of age, with two infant orphans to support. Simon had been at a distance when the news of our misfortune arrived, but, on returning to his home, not far from ours, immediately came to pour the blessed balm of at once heavenly and earthly consolation into the wounded heart. He arranged plans with my mother for her future comfort and conduct, procured the arrears of my father's pay and prize-money, and, through his vivid representations of our case to some of the neighbouring gentry, obtained a small pension for the brave young sailor's widow and orphans. I remember him arriving one sunny morning with a pick and spade over his shoulder, and a great bundle of willow slips under his arm, to put the little yard belonging to our lonely hut in order, and to mend its fence. He always took me along with him to all such pieces of work; taught me to be useful and careful; to weed and to water the new planted kail and willows, and the new-sown turnips; to pick up all sticks, and stones, and litter; and to exert my almost infant strength and activity at once agreeably and usefully. He spoke to me continually; gave me encouragement and applause for all my little feats of ingenuity or agility, and, above all, for any traits of consideration or exertion of thought and reason that I chanced to display. My mother did not sit idle while another was working for her. With great natural abilities, sound sense, and a true independent Scottish heart, joined to much docility, she soon roused herself from the apathy of despair into which she was sinking at the time Simon came to see her. She worked incessantly and usefully; and the worthy man, delighted to find his endeavours to serve her crowned with such success, redoubled his kindness and affection. He brought my sister a weaned calf, which he called her tocher. This she and I concluded was the name of the animal, and it never after got any other. This calf proved the source of wealth to the whole family, and set us completely above want.

After his return from every journey, Simon came to see us, and was ever the forerunner of joy and comfort. His very looks, his mere presence, was comfort. But, besides, he always found something in each to praise and approve. He had always something to show, or tell, or teach; and he set every thing to rights that was beyond our skill or strength. He taught me to plait and then prune the willow fence, and to make baskets of the prunings—a most useful lesson, and easily learned. He also taught me another still easier and as useful—it was, never to leave litter of any kind at my heels, but to carry at once every sort of rubbish to its own proper place. Stones he heaped in one unoccupied corner, there to lie till they were needed. Weeds, sticks, stalks, and blades, were all laid in another heap to decay, and afterwards to be used as manure. "Child," he said, "put nothing to waste; every thing on earth has its use. Only teach yourself betimes to keep every thing where it ought to be, and you will know where to find it; and there will be neither confusion, nor waste, nor time lost, breaking your bones tumbling over rubbish, or hunting for what is destroyed through want of order." My mother had brought us up in such perfect obedience, from the earliest hours of our existence, that contention and discontent were utterly unknown in the house. No scolding—no punishments—my sister and I had not an idea or a wish but to do instantly what we were desired. Thus we were easily taught; and I learned to read so early, and so gradually, and with so little trouble, that I scarcely remember when or how it was; but it is associated in my memory with my mother's love and caresses.

It seems to me that I can look back on a very long period of time in which Simon was our active and never-failing friend. But I can give no narrative of those years, even were the life of a herd-boy likely to afford subjects for narration. Simon provided me with books to read, when, with no companion but my dog, I was at my lonely occupation of herding cattle, sent out to graze among ill-fenced fields; and at night I attended with my sister a school, where we learned writing and arithmetic. The praises of my master awakened many ambitious feelings in my mind, and these might have led to much mischief, but Simon soon after took me as his servant to learn farm-work; and in the intervals of his journeys, perhaps perceiving the aspirings of my heart, took occasion to tell me what had been his own destination in early life. His father, who had been all his days a pedlar, had acquired so much money as to afford his son a good and even a learned education, intending him, of course, for the church. Through all the preparatory schools, Simon passed with credit to himself, and, at eighteen years of age, was sent to college. There, though the expense of the various classes was very great in comparison with the country schools, it could and would have been borne without murmur or surprise, because it was expected; but even Simon's father, accustomed to buy, and sell, and calculate, had not calculated on such an expense as had actually and unavoidably accumulated before the close of the season, when all came to be summed up. But that was not all. Simon always saw with his eyes and heard with his ears, and every sense pressed conviction on his heart, that, except in very particular circumstances, the learned professions are not for a poor man's son. Where the bent to any particular profession is very strong, and the capacity for acquiring the preliminary branches indisputable, who shall venture to oppose the powerful dictates of nature? Yet, even in this rare case, what father and mother would not dread for their son the long apprenticeship of privation, and temptation, and penury, and mortification, and toil! But, in all ordinary cases, merely because a poor man has been blessed with a son of such good talents, as, by the help of reading, writing, and arithmetic, as an outset, would fit him for an apprentice or clerk in any of the respectable trades or occupations of life, is not satisfied with *that*, but becomes immediately possessed with the vain desire of making him a minister, he shows in the very wish that he is utterly ignorant of the course to be pursued, every step of which would prove to him a step towards misery and ruin. "It is a possession!" cried Simon, driving his spade deeper in the clod, and letting it stand there for a time; "I say it is nothing but a possession. It is the delusion of the enemy in the semblance of an angel of light to wile poor mortals to misery and ruin! What I have seen, in that one session at college, of human wretchedness! I might add, of vice, but that is best untold; poverty is ill enough without it! How many wretched lads did I there see!

"Among these future doctors and ministers, however, I soon began to distinguish between those who wore the symbols of honest poverty alone, untainted with reckless vulgarity and dirt. Our pursuits and rank being the same, with many of these I became acquainted; and that was the time when I learned what is suffered by lads, even of the highest talents, and unpolluted with a single vice, when thrust, by their own misguided ambition, or the deluding fondness and vanity of their parents, into situations of expense which their humble means are utterly unable to support. There it was I first knew some who had nearly finished their studies and their lives: the body worn to a shadow—the kind, noble heart sunk into despondency by want and woe—and the bright intellect strained to the verge of insanity by over-exertion, surrounded by poverty, and anxiety, and starvation!" Simon's voice trembled with emotion as he spoke. He stood a minute silent, and then resumed his spade, with a cloud on his brow, very unlike the usual sunbright expression which characterised his face. It was long before he spoke again, and when he did, he abruptly began the same subject which it appeared he had mentally pursued. "That was my first and last season at college. I laboured hard—made all the improvement I could; and, when the session was over, bade it, and every thought of being made a gentleman, farewell. I gratefully thanked my good father for what he had already done for me, but, by an account of what I had seen among my fellow-students, effectually cured him of the wish to make his son a minister."

No man was ever better entitled to direct and advise than Simon; for in all things he practised his own lessons, and exacted far more of himself than of others. If ever it might be said of any mere man, I might dare to say of him, that he went about continually doing good. I loved him and revered him from my infancy as a father, and of late had begun to repeat that honoured title more tenderly in my heart, for it was mingled there with another, and that other was the name of Simon's daughter. I loved, I suppose, as other boys love; though, of course, I thought no boy or man had ever loved like me. Simon, probably, was aware of my feelings before I knew them myself, and soon spoke to me with all the frankness of his upright guileless heart. He threw no obstacles to torment or provoke me to fly in the face of reason and duty; but he calmly explained the enormity of people marrying before having the means of providing for a family—a crime which he illustrated by many a woeful example; and, after pointing out, and placing me on the road through which I might, by my own efforts, obtain these means, we went on peacefully, like father and son, as before. He gave me the management, first of a part, and then of all his farm, during his summer journeys, and also encouraged me to take a small portion of it into my own hands, for which I paid him rent like Jacob. I served him seven years, and they seemed to me but as seven days. I was not, like Jacob, cheated at the end of them; for these labours had their effect, and enabled me to acquire a legal title to call Simon father. That I have been happy beyond the common lot, will be easily believed, when I say that Simon's daughter is worthy of her parentage.

Years have rolled on; how rapidly they roll, and with ever-increasing speed! Still they have found me a blest and happy man, in spite of an ordinary portion of the troubles and sorrows of this scene of trial.

DIVISIONS OF THE GLOBE.

The natural division of the surface of the globe is into sea and land, about three-fourths of the whole being occupied by water, although probably nowhere to a depth beyond two or three miles. The remaining fourth consists of land elevated more or less above the level of the sea, interspersed in some parts with smaller collections of water at various heights, and in a few instances somewhat lower than the general surface of the main ocean. Thus, the Caspian Sea is said to be about three hundred feet lower than the ocean, and in the interior part of Africa there is probably a lake equally depressed. We cannot observe any general symmetry in this distribution of the earth's surface, except that the two large continents of Africa and South America have some slight resemblance in their forms, and that each of them is terminated to the eastward by a collection of numerous islands. The large capes projecting to the southward have also a similarity with respect to their form, and the islands near them. To the west, the continents are excavated into large bays, and the islands are to the east. Thus, Cape Horn has the Falkland Islands; the Cape or Good Hope, Madagascar; and Cape Comorin, Ceylon to the east. The great continent, composed of Europe, Asia, and Africa, constitutes about a seventh of the whole surface of the earth; America, about a sixteenth; and New South Wales, about a fifth; or, in hundreth parts of the whole, Europe contains two; Asia, seven; Africa, six; America, six; and Australia, two; the remaining seventy-seven being sea; although some authors assign seventy-two parts only out of one hundred to the sea, and twenty-eight to the land. These proportions may be ascertained with tolerable accuracy, by weighing the paper made for covering a globe, first entire, and then cut out, according to the terminations of the different countries. Or, if still greater accuracy were required, the greater part of the continents might be divided into known portions of the whole surface, and their remaining irregular portions alone weighed. It will be seen, even by a superficial glance at an artificial globe, that the great preponderance of land lies towards the northern hemisphere or half; all the continents lie in this direction, and to the south is a wide expanse of ocean, studded with numerous small and scattered groups of islands. It will be observed, too, that the continents stretch from the north pole towards the equator and south pole, or parallel to the lines of longitude, not across or parallel to the equator. The general inclinations and levels of the continents are discovered by the course of their rivers. Of these the principal are, the river of Amazons, the Senegal, the Nile, the river St Lawrence, the Hoanho, the river La Plata, the Jenisei, the Mississippi, the Volga, the Oby, the Amur, the Oronooko, the Ganges, the Euphrates, the Danube, the Don, the Indus, the Dnieper, and the Dwina; and this is said to be nearly the order of their magnitudes.

We may form a pretty accurate idea of the levels of the ancient continent, by tracing a line across it in such a direction as to pass no river, which will obviously point out a tract of country higher than most of the neighbouring parts. Beginning at Cape Finisterre, we soon arrive at the Pyrenees, keeping to the south of the Garonne and the Loire. After taking a long turn northwards to avoid the Rhine, we come to Switzerland; and we may approach very near to the Mediterranean in the state of Genoa, taking care not to pass the branches of the Po. We make a circuit in Switzerland, and pass between the sources of the Danube and of the branches of the Rhine in Swabia. Crossing Franconia, we leave Bohemia to the north, in order to avoid the Elbe, and coming near to the borders of Austria, follow those of Hungary to the south of the Vistula. The Dneiper then obliges us to go northward through Lithuania, leaving the Don wholly to the right, and the Volga, to pass still farther north between Petersburgh and Moscow. We may then go eastwards to the boundaries of Asia, and thence northwards to Nova Zembla. Hence we descend to the west of the Oby, and then to the east of the branches of the Volga, and the other inland rivers flowing into the Lake Arel and the Caspian Sea. Here we are situated in the widely extended elevation of India, in the neighbourhood of the sources of the Indus; and, lastly, in our way from hence towards Kamschatka, we leave the Jenisei and Lena on the left, and the Ganges, &c., on the right. The direction of the most conspicuous mountains is, however, a little different from this. The principal chain first constitutes the Pyrenees, and divides Spain from France; then passes through Auvergne to join the Alps, and through the south of Germany, Dalmatia,

Albania, and Macedonia. It is found again beyond the Euxine, under the names of Taurus, Caucasus, and Imaus, and goes on to Tartary and Kamschatka. The peninsula of India is divided from north to south by the mountains of Gate, extending from the extremity of Caucasus to Cape Comorin. In Africa, Mount Atlas stretches from Fez to Egypt, and the mountains of the moon run nearly in the same direction. There is also a considerable elevation between the Nile and the Red Sea. In the New World, the neighbourhood of the western coast is in general the most elevated. In North America, the Blue Mountains or Stony Mountains are the most considerable, and the mountains of Mexico join the Andes or Cordeliers, which are continued along the whole of the west coast of South America. There are several points in both hemispheres, from which we may observe rivers separating to run to different seas. The highest mountains in the world are the Himalaya range in Asia, which are upwards of twenty-eight thousand feet; Chimborazo, in America, twenty-one thousand; the Abyssinian mountains in Africa, from ten to fifteen thousand; Mont Blanc, in Switzerland, fifteen thousand; and the Appenines, upwards of nine thousand feet. The plains of Quito, in Peru, are so much elevated, that the barometer stands at the height of fifteen inches only, which at the level of the sea stands at thirty inches: thus the air is there reduced to half its density. But none of these heights is equal to a thousandth part of half the earth's diameter, and the greatest of these might be represented as grains of sand on a six-inch globe.

The internal parts of the body of the earth are little known from actual observation, as the deepest mines or excavations are comparatively as but scratches on the end of an apple. The real density of the earth, then, beyond the mere surface, is but matter of conjecture. From observations on the attraction of the mountain Shehallion, Dr Maskylen supposed the actual mean density of the earth throughout all its mass to be to that of water as 4½ to 1, judging from the probable density of the internal substance of the mountain, which he supposed to be a solid rock. Mr Cavendish has concluded more directly, from experiments on a mass of lead, that the mean density of the earth is to that of water as 5½ to 1. This density assigned by Mr Cavendish is not at all greater than might be conjectured, from observations on the vibrations of pendulums. The great Newton had long ago advanced it as a probable supposition, that the mean density of the earth might be about five or six times as great as that of water, and the perfect agreement of the result of many modern experiments with this conjecture, affords us a new proof, in addition to many others, of the accuracy and penetration of that illustrious philosopher.

THE HOUSES OF THE ROMANS.

In the early ages of Rome the houses were merely thatched cottages. After the city was burnt by the Gauls, they were built in a more spacious and convenient style, and of more substantial materials; but so great was the haste to have them erected, that no attention was paid to the regularity of the streets. Every one set down his habitation according to his own taste or fancy.

The success of the Roman arms in Greece served to introduce an immense improvement in the Roman architecture, and towards the Augustan era, Rome might well boast of the magnificence of her buildings. During the reign of Augustus, the improvements seem to have been conducted on a very extensive scale, and to have justified the emperor in exclaiming, that he had found Rome of brick and had left it of marble. Still, however, the streets continued narrow and crooked, and the houses were for the most part of wood, generally of three stories, and very inconvenient. A dreadful conflagration in the reign of Nero reduced the greatest part of Rome to ashes, but it was soon after rebuilt with increased splendour. The streets were made of greater width, and laid out with more regularity, and the height of the houses was restricted to a certain standard. Every house was ordered to be isolated, and to be built of stone, so as to be less subject to destruction by fire. This also contributed to the health and magnificence of Rome, though there were many at the time who censured the improvements, and pretended that the narrow streets and lofty houses produced an agreeable shade in the heat of summer, and rendered the city both pleasant and salubrious. We have heard the same argument urged at Barcelona, Nice, and Genoa, at the present day; yet in each of these towns the streets are widened, whenever it is practicable to do so.

When a house was occupied by several families, Adam says it was called *insula*, or island. But we are rather inclined to think that an island meant, as it still does in the south of France, the houses enclosed within four streets. *Domus* was the name given to what we call in Scotland a self-contained house.

The principal parts of a house were—

The Vestibule, an open space in front of the gate. The vestibule of the golden palace of Nero was so extensive, that it had three porticos, each a mile in length, and which enclosed a large basin of water, surrounded by so many buildings, that they presented the appearance of a town.

The Door, made in general of different kinds of wood, such as cedar, cypress, elm, and oak, but sometimes of iron or of brass. The doors of the temples were often inlaid with ivory and gold. They were in general elevated above the street by a flight of steps, at least this was the case in the temples, and, in all probability, also in the houses of Rome, though the doors of the houses of Pompeii are found on a level with the footpaths. The door opened inwards, like those used by us; but among the Greeks, and in order to confer honour on meritorious citizens among the Romans, it was made to open outwards. Hence arose the custom, when a person intended going out of a house, of knocking on the door, to warn those who were passing by to get out of the way—a circumstance which serves to explain some passages of the dramatic authors of that period. A slave, usually in chains, acted as porter; he bore in his hand a bludgeon, and had by his side a dog, chained up like himself. On his lodge was painted *cave canem* (beware of the dog). Dogs were often employed to guard the temples. Old women were also sometimes employed as porters. On days of rejoicing, such as on the birth of a child, the doors were ornamented with flowers and branches of trees, and in the evening were illuminated. By a decree of the senate, branches of laurel were suspended at the door, and a garland of oak-leaves was placed on the summit of the palace of Augustus. Tiberius declined this honour.

When the door was shut, it was secured by bolts and locks; sometimes two bolts were used, one above, and the other below. The lock seems to have been moveable, like our padlock. Knockers or bells appear to have been generally used.

The gate served as an entrance to the Hall, three sides of which were supported on pillars. The side opposite to the entrance was fitted up as the library, where the family archives were kept. The hall was the principal bed-chamber, and the spot where domestic manufactures were carried on. In ancient times it served as the kitchen, and the place where the family supped. It was also the room where the noble families kept the statues of their ancestors, and received company. It was ornamented with paintings, statues, and valuable furniture, and was divided by curtains. Visitors were received into these divisions according to their rank. A blazing wood fire was always kept in it, and it was the duty of the porter to provide the necessary fuel. The Romans seem to have had no chimnies, and were sadly annoyed with smoke: hence the month of December was called *smoky*, on account of the fires which were then necessary. They seem to have made use of portable stoves to heat the different parts of the house; and in the time of Seneca, the plan of heating the upper floors from below, by means of pipes built in the walls, was discovered.

The Court-Yard was in general open, but sometimes surmounted with a roof which admitted the light; it was always of smaller size than the hall. The slave who had charge of it acted as the overseer of his companions in servitude.

The Bed-Chambers were of two classes, the one for reposing in during the day, and the other during the night. In general, these had anti-chambers, and presses for containing a few books. A curtain was sometimes suspended before the door, which was drawn aside when any one entered. The slaves who superintended them were also accustomed to announce the arrival of visitors, to whom the emperors often gave audience in their bed-chambers.

At the top of the house was erected a small apartment which faced the sun, and served as a place of retirement, or a *look-out*, such as is yet to be seen in the south of Spain. But the architecture and interior arrangements of the houses varied at different periods, and according to the taste of the different proprietors.

The houses of Rome, previous to the war of Pyrrhus, were covered with boards, but afterwards with tiles; and, according to Vitruvius, and from what remains of ancient monuments, these must have been of a large size, not less than two feet broad. Seneca speaks of a garret covered with one single tile. In the war against Marc Antony, the senators were taxed at the rate of ten asses (about 1s. English) for every tile on their roof: hence it was of course desirable to have them of as large dimensions as possible. The roof seems to have been angular, as are ours at present. The fronts of the temples were ornamented with a pediment, on which were inscriptions and statues. The senate granted liberty to Julius Cæsar to add a pediment to his house, and to ornament it in the same manner. The night before his death, his wife Calpurnia dreamt that these ornaments had fallen down.

In early times the houses were lighted by simple openings in the walls, furnished with wooden shutters, and sometimes with curtains. Nets were at times made use of to keep out noxious insects, and, as is still to be seen in the south of Europe, awnings, to afford shade from the glare of the sun. Under the first emperors, flakes of talc began to be employed in windows, in the same manner as glass with us. Its use was, however, confined to the principal apartments of great houses, gardens, porticos, litters, &c. Glass was used for various purposes, but not in windows until the fourth century, when St Jerome speaks of it as being then in use. The bronze frames discovered at Pompeii may have been filled with talc, and the fragments of large panes of glass found there, may have been covered over during one of the later eruptions of Vesuvius, by which Pompeii was destroyed.

At the same period, the Romans paved their floors with small pieces of stone or marble of different colours, neatly joined together; they also covered the walls with marble slabs. The ceilings were often gilded, painted, or inlaid with ivory. Nero is said to have constructed one in his dining-room, which shifted, and presented a new figure every time a change of service was introduced.

We shall conclude the subject with a few remarks on the value and annual rent of some of the Roman houses. Cicero bought the house of Crassus, for which he paid L.28,255. Messala paid for that of Marc Antony, L.352,786. Domitius valued his at L.48,437. That of Claudius cost L.119,480. The country house of M. Scaurus, which was burnt by his slaves, was valued, along with some other articles, at L.807,296. The golden palace of Nero must have cost an immense sum, since Otho spent L.403,645 in finishing only a part of it. The rise in the value of property was excessive in the course of a few years. The house of Marius, which Cornelia had purchased for L.2420, was resold soon after to Lucullus for L.16,150. The house of Lepidus, which, during his consulate, was considered one of the most elegant in Rome, only stood in the hundredth rank thirty-five years afterwards. It is conjectured, from what Suetonius says, that people of moderate fortune in the time of Cæsar rented houses at L.16, 3s. per annum. The rent which Coelius paid was L.242.—*From a periodical work.*

ODDS AND ENDS OF SUBJECTS.

SINGULAR CUSTOM.

Throughout the province of New Granada, in South America, it is the custom, on certain festival days, to erect in front of the principal church a sort of artificial grave, in which are placed birds of the most beautiful plumage, animals remarkable for their shape or size, and wild beasts, both dead and living. In order to render this sacred exhibition as rich as possible, all the hunters of the neighbourhood are for some time previous employed in scouring the country in search of rare animals, in which laudable undertaking each parish endeavours to outdo the others. By this means the show is often magnificently supplied, and furnishes naturalists with the means of advancing the interests of science.

SATIRICAL REPROOF.

Malherbe, who prided himself on his blunt honesty, was one day shown by a courtier some poetry, which stated that France moved out of her place to receive her king. "Now this must have happened in my lifetime," said Malherbe; "but, upon my word, sir, I do not recollect it."

MAUNDAY THURSDAY CUSTOMS.

The custom with the kings of England of giving presents, or charity, on Maunday Thursday, to a number of persons corresponding with the number of years the king has lived, seems to have had its origin in the East. The princes of Hindostan have done the same thing on their birth-day as far back as history extends. The pensioners of the latter, however, were not merely interested in the age of the king, but in the bulk (supposed, we presume, to indicate the prosperity of his affairs) attained by the royal persons. The king was weighed against a quantity of gold, quicksilver, perfumes, and other valuable substances, which, after the balance was nicely adjusted, were given away. The presents depending on age, consisted of sheep, goats, fowls, &c.

THE BROWN BEAR.

On the 26th May 1826, a son of Mr Adam Millar, about seventeen years of age, of Troy township, near Cleveland, Ohio, America, had occasion to pass through a piece of wood, which extended about four miles. Having proceeded about a mile, he discovered at a short distance a bear and three cubs. Being entirely destitute of weapons of defence, he tried to frighten them off, by hallooing; but the old bear immediately made towards him, and he sprang to a sapling, about ten inches in diameter, and free of limbs to the height of forty feet. This he ascended, and the bear followed. At the height of ten or twelve feet she was so near as to receive a kick, and she slipped to the bottom. She immediately reascended, while he exerted himself to climb beyond her reach; but she again overtook him, and, as he kicked at her, she tore his right foot badly, took off his shoe, and then fell to the ground. She then followed him up the third time, and fell without doing him any injury. He had now ascended the sapling about twenty feet; but the old bear was soon at his heels the fourth time, caught his left foot, and both fell together. On reaching the ground, the bear started from him about a rod, when he recovered and ran; she followed thirty or forty rods, and gave up the chase, and the young man reached home in safety.

Edinburgh: Published, weekly, by W. and R. Chambers, 19, Waterloo Place; Orr & Smith, Paternoster-row, London: and W. Curry, Jun. & Co., Dublin. Agent in Glasgow, John Macleod, 20, Argyle Street; and sold by all other Booksellers in Great Britain and Ireland.—Chambers's Historical Newspaper, a Supplement to the present publication, is published on the first of every month; and Chambers's Information for the People, of which every number is a distinct branch of human knowledge, appears once every fortnight.—Subscribers in Edinburgh may have these papers left at their houses as they appear, by giving their addresses at 19, Waterloo Place, and paying subscriptions for a quarter, a half year, or a year, in advance.—Price of a quarter of the Journal, 1s. 6d.

Typography executed by W. and R. Chambers; stereotyped by A. Kirkwood; and printed by Ballantyne and Company, Paul's Work.

CHAMBERS' EDINBURGH JOURNAL

No. 91. SATURDAY, OCTOBER 26, 1833. PRICE THREE HALFPENCE.

THE LAND OF BURNS.

SECOND ARTICLE.

In the 54th number of the Journal appeared an article under this title, in which we commenced a topographical sketch of that part of the county of Ayr which derives interest from the life and poetry of Robert Burns; mized up with anecdotes of persons and things noticed in his writings. In that article, it may be recollected, we were only able to advert to the district near Alloway Kirk, where the poet was born, and spent the first few years of his life. We now propose to glance at the vale of the Ayr, where he lived from his seventeenth to his twenty-seventh year (1777–1786), and wrote all those poems which first obtained him distinction in the world.

The valley of the Ayr may be described as a large tract of open swelling country, extending from the county town, to which the river gives its name, and where it falls into the sea, to the uplands which divide Ayrshire from Clydesdale. The country has that striking peculiarity observable in the neighbourhood of the Esk at Roslin, and other rivers in Scotland: it is high and level, and preserves one uniform character every where, except on the immediate brink of the river, where in many places are found precipitous and rocky banks, as if the water had worn a chasm for itself, or been directed into one previously formed by some tremendous convulsion of nature. The deep sections of red sandstone thus exposed to the air, shagged with bushes growing from the fissures—the grand downward sweep of old woods which clothes the less rocky banks—the deep black pools of the hermit river, as he steals on pensively and obscurely to the sea—altogether form a tract of scenery which is hardly surpassed by any thing of the same kind in Scotland. Coilsfield, Barskimming, Auchinleck, Ballochmyle, and Catrine, are the names of gentlemen's parks which include the best parts of this fine range.

The principal road through this tract of country is that leading from Ayr to Mauchline, upon the north side of the river, and generally at some distance from its margin. It was by this route that the present writer made his pilgrimage through the valley of the Ayr, and he will accordingly describe the objects he saw in the order in which they are presented to a person travelling in that direction.

Nothing of particular interest occurs for the first seven miles, when at length the pilgrim reaches the village of Tarbolton, so intimately connected with Burns's history. In the neighbourhood of this village is situated the farm of Lochlee, where the poet lived, as a humble denizen of his father's household, from the seventeenth to the twenty-fourth year of his age. This, of course, was the clachan to which at that period he resorted for the pleasures of society. He formed here, in 1780, a club of young men, who met monthly for mutual improvement and entertainment, and of which he and his brother poet David Sillar were the leading members: the utmost extent of expenditure on any night was threepence. Here, also, was a lodge of freemasons, which he delighted to attend, and to whom he wrote a farewell, incorporated in his poems. The lodge still exists, and possesses among its records many letters from Burns, some written long after he was locally dissevered from the association, but still breathing an intense interest in its concerns. It was after attending a meeting of this lodge that he wrote his poem entitled "Death and Doctor Hornbook," the object of which was to burlesque the schoolmaster, who had offended him that night in the course of an argument. This individual had become attached to medicine, and having a small grocery shop, in which among other things he sold the more ordinary kinds of medicine, conceived himself qualified to accompany these with what he called "advice." The satire was nothing more at the time than an expression of the author's gall against a man who had ruffled him a little; and if it had never been published, the revenge could not have been said to have greatly exceeded the offence. On its being given, however, to the world, it produced effects, which, considering the innocent, and perhaps even laudable nature of the schoolmaster's new vocation, must be deplored by every right-thinking person. It overwhelmed him with so much ridicule, that he found it necessary to leave the village, and seek in a more extended scene that obscurity which he could no longer enjoy in Tarbolton. He removed to Glasgow, and became a teacher in the Gorbals, where, it is pleasant to record, he prospered so well during a long course of years, as ultimately to realise a respectable competency. We have been informed by individuals who enjoy his acquaintance, that he is a truly virtuous and amiable man, totally the reverse of what might be presumed from the ungenerous sarcasms of the poet.

Tarbolton lies upon the banks of a small stream denominated Faile Water, and at no great distance may be traced the remains of that monastery to which the poet of the Reformation alludes in his well-known verse—

> The friars of Faile ne'er wanted ale,
> As long as their neebors' lasted;
> The monks of Melrose made gude kale
> On Fridays when they fasted.

In pursuing its way to the Ayr, the Faile passes through the park of Coilsfield—a name which will awaken many recollections in association with Burns. Coilsfield was, in the days of Burns, the seat of Colonel Hugh Montgomery, a cadet of the house of Eglintoune, and who, in 1797, succeeded to that peerage, which his grandson now enjoys. The poet alludes to him, when he says—

> —— Could I like Montgomery fight,
> Or gab like Boswell,
> There's some sark-necks I wad draw tight,
> And tie some hose wel!.

The house, which has since been renewed, stood upon a lofty bank, overhanging the Faile, surrounded in every direction by the most beautiful woods. It is a scene which, in any circumstances, would arrest the eye of the passing traveller; but it is needless to say that every other charm sinks beneath that which has been conferred upon it by the history and the genius of Burns.

It was one of the most remarkable gifts of this person, that he could invest any object he took a fancy for, however prosaic in the eyes of other people, with the most exalted interest. At the time of his residence near Mauchline, a girl named Mary Campbell, originally from Campbelton in Argyleshire, served at Coilsfield in the humble capacity of *byreswoman*, or dairymaid. She has been described to us by a surviving fellow-servant as a good-looking, middle-sized young woman, somewhat stout, neat-footed, of a fair complexion, blue eyed, and very slightly marked with small-pox. In the eyes of her compeers, she was simply what is called in Scotland a trig lass: in the eyes of Burns, she was an angel. Either before or after being at Coilsfield, she served a year in the house of Mr Gavin Hamilton, the poet's friend at Mauchline; and it is the tradition of that gentleman's family, that Burn's passion for her was the cause of her being discharged. According to the poet himself, after a pretty long trial of the most ardent reciprocal attachment, they met by appointment on the second Sunday of May, in a sequestered spot by the banks of the Ayr, where they spent a day in taking a farewell, before she should embark for the West Highlands, to arrange matters among her friends for her intended marriage to Burns. Probably the two lovers did not confine themselves to the banks of the Ayr, but wandered through the woods of Coilsfield, and along the banks of the Faile; for a spreading thorn is pointed out near the house as somehow connected with their story, either as a scene of meeting or of parting; and the poet himself, in his poetical account of the transaction, addresses the scene at large—

> Ye banks, and braes, and streams around
> The castle o' Montgomerie;
> Green be your woods, and fair your flowers,
> Your waters never drumlie.
> There summer first unfaulds her robes,
> And there they langest tarry,
> For there I took my last farewell
> Of my sweet Highland Mary.
>
> How sweetly bloom'd the gay green birk,
> How rich the hawthorn's blossom,
> As, underneath the fragrant shade,
> I clasp'd her to my bosom!
> The angel hours, on golden wings,
> Flew o'er me and my dearie;
> For dear to me, as light and life,
> Was my sweet Highland Mary.
>
> Wi' mony a vow and lock'd embrace,
> Our parting was fu' tender,
> And, pledging aft to meet again,
> We tore ourselves asunder;
> But oh! fell death's untimely frost,
> That nipt my flower sae early!
> Now green's the sod and cauld's the clay,
> That wraps my Highland Mary.
>
> O pale, pale now, those rosy lips,
> I aft hae kissed sae fondly;
> And closed for aye the sparkling glance
> That dwelt on me sae kindly!
> And mouldering now in silent dust,
> The heart that lo'ed me dearly!
> But still within my bosom's core
> Shall live my Highland Mary.

According to another authority, the adieu of these lovers was performed with certain ceremonials, calculated to deepen the impression of even love itself. They stood on each side of a small brook—they laved their hands in the limpid stream—and, holding a Bible between them, pronounced their vows to be faithful to each other. This Bible is or was lately in possession of a surviving sister of Mary, at Ardrossan. Upon the boards of the first volume is inscribed, in Burns's hand-writing—"And ye shall not swear by my name falsely, I am the Lord." *Levit.* chap. xix. v. 12. On the second volume—"Thou shalt not forswear thyself, but shall perform unto the Lord thine oaths." *St Matth.* chap. v. 33. And on a blank leaf of either —"Robert Burns, Mossgiel," with his mason-mark.

The parting was an eternal one. On returning to Greenock on her way to Ayrshire, Mary Campbell died of an inflammatory distemper, and was buried in the churchyard there, where a monument, commemorating her story, was about ten years ago erected to her memory: her mother was then resident in Greenock.

What turn might have been given to the fate of Burns, if he had been united to this amiable though humble person, and thus redeemed in all probability from many subsequent follies, it were vain to speculate. It is to be supposed, however, that he often had occasion afterwards, when "musing on wasted time," and perhaps writhing under a consciousness that the tenor of his life was neither innocent nor profitable, to say with Serjeant Bothwell, in his most touching record of early and unfortunate passion,

> Both heaven and earth might now approve me,
> If thou hadst lived, and lived to love me.

Other attachments, including many less pure as well as less impassioned, afterwards possessed his breast; but the recollection of "Mary" seems to have ever

remained with him, and even to have recurred more particularly when the consequences of those less worthy attachments were pressing upon him. At the time when one of these was about to drive him into a degraded exile, he composed the following verses, which powerfully express the bitterness of his feelings on the occasion:—

O'er the mist-shrouded cliffs of the lone mountain straying,
Where the wild winds of winter incessantly rave,
What woes wring my heart while intensely surveying
The storm's gloomy path on the breast of the wave!

Ye foam-crested billows, allow me to wail,
Ere ye toss me afar from my loved native shore;
Where the flower which bloom'd sweetest in Coila's green vale,
The pride of my bosom, my Mary's no more.

No more by the banks of the streamlet we'll wander,
And smile at the moon's rimpled face in the wave;
No more shall my arms cling with fondness around her,
For the dewdrops of morning fall cold on her grave.

No more shall the soft thrill of love warm my breast;
I haste with the storm to a far distant shore,
Where, unknown, unlamented, my ashes shall rest,
And joy shall revisit my bosom no more.*

To pursue this affecting tale in the words of Mr Lockhart:—"That noblest of all his ballads, *To Mary in Heaven*, was, it is on all hands admitted, composed by Burns in September 1789 [at Ellisland], on the anniversary of the day on which he heard of the death of his early love. But Mr Cromek has thought fit to dress up the story with circumstances which did not occur. Mrs Burns, the only person who could appeal to personal recollection on this occasion, and whose recollections of all the circumstances connected with the history of her husband's poems are represented as being remarkably distinct and vivid, gives what may at first appear a more prosaic edition of the history. According to her, Burns spent that day, though labouring under a cold, in the usual work of his harvest, and apparently in excellent spirits. But as the twilight deepened, he appeared to grow 'very sad about something,' and at length wandered out into the barn-yard, to which his wife, in her anxiety for his health, followed him, entreating him in vain to observe that frost had set in, and to return to the fireside. On being again and again requested to do so, he always promised compliance, but still remained where he was, striding up and down slowly, and contemplating the sky, which was singularly clear and starry. At last Mrs Burns found him stretched on a mass of straw, with his eyes fixed on a beautiful planet, 'that shone like another moon,' and prevailed on him to come in. He immediately, on entering the house, called for his desk, and wrote, exactly as they now stand, with all the ease of one copying from memory, the sublime and pathetic verses—

Thou lingering star, with lessening ray,
That lovest to greet the early morn,
Again thou usher'st in the day
My Mary from my soul was torn.
O Mary! dear departed shade!
Where is thy blissful place of rest?
Seest thou thy lover lowly laid?
Hear'st thou the groans that rend his breast?

That sacred hour can I forget,
Can I forget the hallow'd grove,
Where by the winding Ayr we met,
To live one day of parting love?
Eternity will not efface
Those records dear of transports past;
Thy image at our last embrace;
Ah! little thought we 'twas our last

Ayr gurgling kiss'd his pebbled shore,
O'erhung with wild woods thick'ning green:
The fragrant birch, and hawthorn hoar,
Twined amorous round the raptured scene.
The flowers spring wanton to be press'd,
The birds sang love on every spray,
Till too, too soon the glowing west
Proclaim'd the speed of wingèd day.

Still o'er these scenes my memory wakes,
And fondly broods with miser care;
Time but the impression deeper makes
As streams their channels deeper wear.
My Mary, dear departed shade!
Where is thy blissful place of rest?
Seest thou thy lover lowly laid?
Hear'st thou the groans that rend his breast?

To wander through these woods of Coilsfield, and reflect that, as the residence of rank and affluence, they are as nothing, but derive immortal glory from the attachment of a ploughman to a menial servant, both of whom lived forty years ago, fills the mind with reflections which we would vainly attempt to describe.†

* First published in the Edinburgh Literary Journal, of November 21, 1829; being taken from a manuscript in the possession of Mr Lewis Smith, bookseller, Aberdeen.

† In a cottage amidst the Coilsfield woods lives Hugh Andrew, aged 73, who in Burns's days served Colonel Montgomery in the capacity of whipper-in. We conversed with this man, and obtained from him the above description of Highland Mary, which he was the more likely to give correct, as he "had ance a kind o' notion o' the lass himsel'." He remembers seeing Burns come one day, in his bluish-grey home-made clothes and blue rig-and-fur stockings, to be introduced to the lady of Colonel Montgomery. He was quite well known to Burns, having occasionally to act as a steward in the Tarbolton Lodge when the poet was president. Honest Hugh tells, that Burns had him in his eye in the verses of the Twa Dogs—

"Our whipper-in, wee blastit wonner,
Puir worthless elf, it eats a dinner,
Better than ony tenant man
His honour has in a' the lan'."

The honour is not likely to be disputed.

NATURAL PHILOSOPHY.

THE following paper on natural philosophy is abridged from an excellent article in the *Dublin University Magazine*, for August. In the present extraordinary dearth of really good literary articles in our magazines, it is pleasing to discover one which is alike distinguished for the simplicity of its language and the utility of its object:—

"The history of philosophy is one of the most interesting studies of the man of letters. The view of the progress of knowledge, from its earliest recorded developement, to its present extended diffusion, offers to the reflecting mind a field of contemplation worthy of traversing. If we compare the feeble efforts of the most ancient philosophers to penetrate the veil of ignorance which then surrounded mankind, with the mighty power of the promoters of knowledge of the present day, we must be struck with the extraordinary progress of the human mind through the different stages of barbarism, semi-civilization, and recent advancement. Let us consider the kind of knowledge acquired by these philosophers on their travels.

Thales, of Miletus, visited Egypt, where he studied geometry, astronomy, and cosmogony. He was the founder of the Ionian sect of philosophers, upon his return to his native place. He appears to have taught the cause of the inequality of days and nights, and the theory of eclipses. He maintained that water is the principle of which all the bodies in the universe are composed—that the world was the work of God, and that God sees the most secret thoughts in the heart of man. It is related that he measured the height of the pyramids of Memphis by the extent of their shadows; and he is considered the first who employed the circumference of a circle in the measurement of angles.

Pythagoras studied geometry among the Egyptians. This science he improved by his subsequent discovery of several important propositions. He is the earliest recorded teacher of the true system of astronomy, and he made many important discoveries in the other physical sciences. He observed many curious phenomena on the surface of the earth, which must have led him to reason on the changes which this surface must have undergone in the lapse of ages. In the 15th book of Ovid's Metamorphoses, a number of these observations are mentioned, which are extremely curious, and testify, in a very remarkable manner, the superior mind of the philosopher.

Plato also travelled into the east, where he became versed in the learning of the Persians and the Egyptians. He wrote several works, which treated chiefly of metaphysical subjects. He mingled together his doctrines of theogony and cosmogony, so that it is a difficult matter to separate his peculiar notions of the latter. The passage in his writings most interesting to the modern geologist, is that which treats of the Atlantic, recorded by Plato as a large continent beyond the Pillars of Hercules, and which had sunk under water, thereby giving place to the present Atlantic Ocean. He made many improvements in geometry; to him is ascribed the discovery of the mathematical bodies, called the regular solids. He conceived the world to be a figure shaped like one of these solids, called the dodecahedron.

Of the opinions of Aristotle respecting the formation of the world, we have not any very clear account. He wrote upon a variety of subjects, among which natural history occupied a prominent place. 'He regarded the matter of the heavens as ingenerate and eternal—that mankind, and all species of animals, have subsisted from everlasting by a perpetual course of generation, without any original beginning or production; and that the earth has for ever been adorned with trees, plants, flowers, minerals, and other productions, as we now see it to be.' (Univ. Hist. p. 78.) It is possible that he may have taken the idea of the eternity of the world from Ocellus Lucanus, a disciple of Pythagoras, who is the most ancient asserter of this idea, so different from the opinion of his master.

We thus find that the most eminent ancient philosophers indulged more or less in reveries respecting cosmogony. In studying other branches of learning, they must have been frequently led into considerations of the probable origin of the world which they inhabited, and they endeavoured to frame hypothesis, some of which were very ingenious, but more generally extremely absurd. Occasionally a master-mind, like that of Pythagoras, made an approximation to the truth, which has astonished the learned of later times. Sometimes facts were related in corroboration of these hypotheses—sometimes they were distorted to explain the dreams of philosophic fancy. But among the ancients, the observation of natural facts was not made in a way to benefit science. We find many of the arts and sciences brought by the ancients to a considerable degree of perfection. In architecture, poetry, eloquence, and perhaps in some other branches, they equalled the moderns. The progress made by them in geometry was admirable indeed, and they based that science upon a foundation fitted to bear the splendid superstructure raised by modern ingenuity. But in those branches that required a combination of the perceptive and reasoning powers, their progress was very limited. Chemistry and experimental philosophy are of modern origin; at least what was effected in them by the ancients, or rather what is recorded as having been effected, is very trifling. In botany, zoology, and mineralogy, a number of detached observations have been recorded in the writings of Aristotle, Theophrastus, and Pliny; but no classification was ever attempted, nor any extended train of reasoning from these facts adopted by the ancient philosophers.

If we turn our attention to the state of knowledge among the Arabians, we shall find that the mathematical sciences were for the most part cultivated by them. They devoted, it is true, some attention to astronomy and to alchemy, but the former being studied for the purpose of contributing to their desire to penetrate the mysteries of fate, was merely a compound of truth and falsehood, that has been denominated astrology, and the latter, ministering to the passions of most men for acquiring wealth, offering a strong temptation to its votaries, but was of no service in furthering the march of mind, although it discovered facts that were afterwards of service to the modern chemist. We may regard the Arabians more as the preservers of ancient science. Many of the inventions ascribed to them have been traced to the Indians, and were received either directly from that nation, or through the medium of the Greek philosophers, whose works were translated into the Arabic language.

The conclusion to which we may arrive from a contemplation of the state of learning in the early and middle ages, is, that geometry was the only science successfully cultivated, and handed down free of any error or absurdity; all the other branches of learning were more or less imbued with mistaken views, arising generally from imperfect data. There seemed to be little respect paid to knowledge acquired from the observations of facts of daily occurrence. Abstruse studies were most esteemed. Mathematics requiring a train of deep thought, and at the same time of correct reasoning, without needing the aid of experiment requisite in physical science, enabled the cultivators to improve without any danger of perversion.

In the study of natural philosophy a knowledge of mathematics is indispensable on the part of the student, if he venture beyond the vestibule. The votary of pure mathematics will be insensibly led to the application of his favourite science for the explanation of some of the phenomena in nature; and if he be successful in solving any of their mysteries, he will be encouraged to pursue still further the research after physical truth. The ancients were thus led to apply their mathematical knowledge. The name of Archimedes is handed down as one of the brightest in ancient times. His discoveries form an important era in the history of science; and they arose from his extensive application of geometry to physics. Before his time there were no correct notions of the theory of mathematics, and he is the first who pointed out the specific gravity of bodies. He is the only one of the ancients that can bear comparison with the moderns as a natural philosopher.

When learning began, after the dark ages, to revive in Europe, the mathematical lore of the ancients was sought after with great avidity. What had been effected by them in the physical sciences received also its due appreciation. Both the truth and the absurdity of their astronomy, mechanics, and other branches, were swallowed without at first being questioned. But as the attention of the early moderns became more directed to scientific investigation, many of the errors of the ancients became manifest. Some of these were speedily corrected, while others, admitting of more discussion, remained for a longer period under the judgment of the new cultivators of knowledge. Every successive age, however, dispelled more or less of these errors. The study of the pure mathematics advanced with rapid strides. Their field was augmented with numberless new discoveries. Their application to physics became every day more general; and the impulse which science had now received carried forward its votaries with a velocity never before known in its progress.

Natural philosophy had now become a science of great importance from the additions made by its early modern cultivators to what was received by them from the ancients. Among the ancients, Archimedes was the first who applied geometry to physics, and thus gave it a double power. Among the first revivers of learning in Europe was Des Cartes, who applied algebra to geometry, and thus put an engine of incalculable power into the hands of the cultivator of natural philosophy. The attention of the learned was now directed to experiment, a method, if investigated, but little appreciated or understood by the ancients. Galileo, by his invention of the telescope, opened as it were the gates of the heavens, into which rushed a host of ardent inquirers after truth. A number of other illustrious men at the same time directed their attention to experiment in the other branches of physical science. The discovery of printing some time before enabled the new acquisitions to knowledge to be widely diffused, and enable one nation to communicate its learning to another with a rapidity never before conceived. The discovery of America not only was a successful experiment on a large scale, but it added another proof to the true system of the world, and directed in a further degree the attention of men to the examination of natural phenomena. The Reformation promoted the freedom of discussion, and enabled the laity to take part in studies, almost previously attended to by the clergy alone. But what contributed in the greatest degree to the improvement

of physical science, was the new path pointed out to its votaries by the illustrious Lord Bacon. His master-mind discovered the causes of error in the philosophy of the ancients, and demonstrated that as long as their mode of reasoning was pursued, it was impossible for the moderns to frame a true system of science. He asked (Playfair's Diss. Engel. Brit.), 'Wherein can arise such vagueness and sterility in all the physical systems which have hitherto existed in the world? It is not certainly from any thing in nature itself; for the steadiness and regularity of the laws by which it is governed clearly mark them out as objects of certain and precise knowledge. Neither can it arise from any want of ability in those who have pursued such inquiries, many of whom have been men of the highest talent and genius of the ages in which they lived; and it can therefore arise from nothing else but the perverseness and insufficiency of the methods that have been pursued. Men have sought to make a world from their own conceptions, and to draw from their own minds all the materials which they employed; but if, instead of doing so, they had consulted experience and observation, they would have had facts and not opinions to reason about, and might have ultimately arrived at the knowledge of the laws which govern the material world.'

The opinions of Bacon became gradually appreciated. The calm observation of facts became in every succeeding age more attended to, and natural philosophy based upon actual experiment, and not upon the wild conceptions of the imagination.

The science of chemistry may be said to be one of the offspring of the Baconian philosophy. It is a branch of physics—the first principles of which depend wholly upon experiment. Its progress testifies, in a remarkable degree, the importance of the inductive method of reasoning. It required a calm and patient examination of the changes produced on bodies by experiment, in order that a sufficient mass of facts might be accumulated to raise it to the rank of a science. It required its cultivators to divest themselves of all prejudices—to view things as they really are, and not to set out with a previous leaning to a particular set of opinions, and to torture the results of their experiment to prop these opinions up. It is impossible it could have become a regular science under the influence of the Aristotelian philosophy. The more men reasoned from facts, the more did chemistry advance; and it now affords one of the most brilliant examples of the happy mode pointed out by Bacon, for the improvement of knowledge.

If we sum up the results of our observations on the progress of knowledge, we shall arrive at the conclusion, that the observation of facts was the very last object attended to in its march through successive ages, at least the calm and unprejudiced examination of facts. The learned of antiquity seemed more inclined to abstruse studies—to studies which required a precision of reasoning, which often testified their extreme ingenuity. If their first principles were correct, so were their conclusions. But that their first principles were, for the most part, erroneous, we have abundant proof, in many instances. In geometry, their first data were correct, being self-evident truths, and their conclusions were therefore just. For a succession of ages, knowledge, derived from observation of the common objects in nature, was looked down upon as unworthy the regard of the philosopher. There was a consequent bar to the progress of physical knowledge.

After the revival of learning in Europe, it was not to be expected that the eyes of men could be all at once opened to the errors of the ancients. Both the truth and falsehood of the ancient philosophy were studied. The human mind was still imbued with prejudice. This, however, gradually wore away—mathematics became more extended—natural philosophy was extended and improved—chemistry was invented. We may trace the gradual progress of real knowledge from the first axioms of geometry, through the more advanced stages of mathematics—through the successive developements of natural philosophy, to a science resting solely upon a careful examination of facts, the science of chemistry.

Natural philosophy opened to man the field of space—it taught him to regard the motion of objects upon a grand scale—it enabled him to assign dimensions to this space, and to measure the relations of motion. Chemistry taught him to view the changes produced on bodies, by motions of their minute component particles, the measurement of which motions eludes our most subtle investigations. Natural philosophy instructed him in the external relations of the bodies in nature—chemistry in the internal. It led him, as it were, into the mind of inanimate matter.

During the last hundred years, the attention paid to an unprejudiced examination of facts has been continually on the increase. Philosophers have entered upon their investigations without bias to any particular opinions. Instead of commencing their researches by laying down a favourite hypothesis, and then distorting facts to accord with it, they commenced with an impartial examination of the facts themselves, and, following the suggestions of Bacon, they framed their theory by the inductive method of reasoning. By not attending to the advice of Bacon, men were inclined to imagine circumstances which have no existence in reality. They beheld nature through a medium that rarely presented her in her true form. So long as the field of physical science was limited, the liability to view nature in this manner continued; but as discovery followed discovery, the disposition to prejudice became more and more removed. For a long period men adhered to certain dogmas that had been handed down through a succession of ages, and finding it difficult to reconcile many facts in nature with these dogmas, they had recourse to hypothesis, the frequent absurdity of which paved the way to the exploding of erroneous principles, and dispelled the illusion, although supported by the authority of antiquity. Knowledge derived from poets, spreading far and wide, carried with it the examples of its own importance. The arts of life received incalculable improvements; they, in return, aided science. They formed the passage from one branch to another—they were the illustrators of theory, by showing its practical application. The ancient philosopher would have disdained to lend his aid to the agriculturist, the mechanist, or the navigator. The modern man of science regards, as his proudest boast, the improvements given by him to the arts, thereby rendering man little inferior in power to the deities of the ancients.

It seems, indeed, strange that the impartial examination of facts is the result of a highly improved state of scientific knowledge. But so it is. It is only within a comparatively recent period that the point has been reached by the human mind. It has been often remarked, that the farther we advance in knowledge, the more deeply are we impressed with a sense of our own ignorance. Although this may not be exactly true, still we may acknowledge that we are less confident in broaching any new theory, in proportion to the advance of the march of intellect. When our opinions can be submitted to the test of an appeal to facts, we are more cautious in stating these opinions. It is our province to study the facts attentively, so that we may not be found in the wrong.

Geometry teaches us the relations of dimension as conceived in the human mind, but which, in the abstract, has no real existence. Natural philosophy treats of the relations of existing bodies, viewed in a state of motion. Chemistry informs us of the changes produced in the bodies themselves. Mathematics, natural philosophy, and chemistry, frequently view conditions which have no existence in nature."

THE STRANGER.*

HODNET is a village in Shropshire. Like all other villages in Shropshire, or any where else, it consists principally of one long street, with a good number of detached houses scattered here and there in its vicinity. The street is on a slight declivity, on the sunny side of what in England they call a hill. It contains the shops of three butchers, five grocers, two bakers, and one apothecary. On the right hand, as you go south, is that very excellent inn, the Blue Boar; and on the left, nearly opposite, is the public hall, in which all sorts of meetings are held, and which is alternately converted into a dancing-school, a theatre, a Methodist chapel, a ball-room, an auction-room, an exhibition-room, or any other kind of room that may be wanted. The church is a little further off, and the parsonage is, as usual, a white house surrounded with trees, at one end of the village. Hodnet is moreover the market-town of the shire, and stands in rather a populous district; so that, though of small dimensions itself, it is the rallying place, on any extraordinary occasion, of a pretty numerous population.

One evening in February, the mail from London stopped at the Blue Boar, and a gentleman wrapped in a travelling cloak came out. The guard handed him a small portmanteau, and the mail drove on. The stranger entered the inn, was shown into a parlour, and desired that the landlord and a bottle of wine should be sent to him. The order was speedily obeyed; the wine was set upon the table, and Gilbert Cherryripe himself was the person who set it there. Gilbert next proceeded to rouse the slumbering fire, remarking, with a sort of comfortable look and tone, that it was a cold raw night. His guest assented with a nod. "You call this village Hodnet, do you not?" said he, inquiringly. "Yes, sir, this is the town of Hodnet" (Mr Cherryripe did not like the term village;) "and a prettier little place is not to be found in England." "So I have heard; and as you are not upon any of the great roads, I believe you have the reputation of being a primitive and unsophisticated race." "Privitive and sofiscated did you say, sir? Why, as to that I cannot exactly speak; but, if there is no harm in it, I daresay we are. But you see, sir, I am a vintner, and don't trouble my head much about these matters." "So much the better," said the stranger, smiling. "You and I shall become better friends; I may stay with you for some weeks, perhaps months. In the meantime, get me something comfortable for supper, and desire your wife to look after my bed-room."

Mr Cherryripe made one of his profoundest bows, and descended to the kitchen, inspired with the deepest respect for his unexpected guest.

Next day was Sunday. The bells of the village church had just finished ringing, when the stranger walked up the aisle, and entered, as if at random, a pew which happened to be vacant. Instantly every eye was turned towards him, for a new face was too important an object in Hodnet to be left unnoticed. "Who is he?" "When did he come?" "With whom does he stay?" "How long will he be here?" "How old may he be?" "Do you think he is handsome?" These and a thousand other questions flew about in whispers from tongue to tongue, whilst the unconscious object of all this interest cast his eyes calmly, and yet penetratingly, over the congregation. Nor was it altogether to be wondered at that his appearance had caused a sensation among the good people of Hodnet, for he was not the kind of person whom one meets with every day. There was something both in his face and figure that distinguished him from the crowd. You could not look upon him once, and then turn away with indifference. When the service was over, our hero walked out alone, and shut himself up for the rest of the day in his parlour at the Blue Boar. But speculation was busily at work, and at more than one tea-table that evening in Hodnet, conjectures were poured out with the tea, and swallowed with the toast.

A few days elapsed, and the stranger was almost forgotten; for there was to be a subscription assembly in Hodnet, which engrossed entirely the minds of men. It was one of the most important events that had happened for at least a century. Such doings had never been known before. All the preparations which Captain Parry made for going to the north pole, were a mere joke to the preparations made by those who intended to go to the Hodnet assembly. At length the great, the important night arrived. The three professional fiddlers of the village were elevated on a table at one end of the hall, and every body pronounced it the very model of an orchestra. The candles (neither the oil nor the coal gas company had as yet penetrated so far as Hodnet) were tastefully arranged, and regularly snuffed. The floor was admirably chalked by a travelling sign-painter, engaged for the purpose; and the refreshments in an adjoining room, consisting of negus, apples, oranges, cold roast-beef, porter, and biscuits, were under the immediate superintendence of our very excellent friend, Mr Gilbert Cherryripe. At nine o'clock, which was considered a fashionable hour, the hall was nearly full, and the first country dance (quadrilles had not as yet poisoned the peace and stirred up all the bad passions of Hodnet) was commenced by the eldest son and presumptive heir of old Squire Thoroughbred, who conducted gracefully through its mazes the chosen divinity of his heart, Miss Wilhelmina Bouncer, only daughter of Tobias Bouncer, Esq., justice of peace in the county of Shropshire.

Enjoyment was at its height, and the three professional fiddlers had put a spirit of life into all things, when suddenly one might perceive that the merriment was for a moment checked, whilst a more than usual bustle pervaded the room. The stranger had entered it; and there was something so different in his looks and manner from those of any of the other male creatures, that every body surveyed him with renewed curiosity, which was at first slightly tinctured with awe. "Who can he be?" was the question that instantaneously started up like a crocus in many a throbbing bosom. "He knows nobody, and nobody knows him; surely he will never think of asking any body to dance. We ought to be upon our guard, I assure you."

For a long time the stranger stood aloof from the dancers in a corner by himself, and people were almost beginning to forget his presence. But he was not idle; he was observing attentively every group, and every individual that passed before him. Judging by the various expressions that came over his countenance, one would have thought that he could read character at a single glance—that his perceptions were similar to intuitions. Truth obliges me to confess, that it was not with a very favourable eye that he regarded the great majority of the inhabitants of Hodnet and its neighbourhood. Probably they did not exactly come up to his expectations; but what these expectations were, it is difficult to conceive.

At length, however, something like a change seemed to come over the spirit of his dreams. His eye fell on Emily Sommers, and appeared to rest where it fell with no small degree of pleasure. No wonder. Emily was not what is generally styled beautiful; but there was a sweetness, a modesty, a gentleness about her, that charmed the more the longer it was observed. She was the only child of a widowed mother. Her father had died many a year ago in battle; and the pension of an officer's widow was all the fortune he had left them. But nature had bestowed riches of a more valuable kind than those which fortune had denied. I wish I could describe Emily Sommers; but I shall not attempt it. She was one of those whose virtues are hid from the blaze of the world, only to be the more appreciated by those who can understand them. Without *her*, the winter fire-side, or the summer evening walk, is destitute of pleasure. Her winning smiles, her unclouded temper, her affectionate gentleness, must throw their hallowed influence over the scenes where her spirit presides, unconscious of its power, else they become uninteresting and desolate.

It was to Emily Sommers that the stranger first spoke. He walked right across the room, and asked her to dance with him. Emily had never seen him before; but concluding that he had come there with some of her friends, and little acquainted with the rules of etiquette, she immediately, with a frank artlessness, smiled an acceptance of his request. Just at that moment, young Squire Thoroughbred came bustling towards her; but observing her hand already in that of the stranger, he looked somewhat wrathfully

* This story is an amplification, by Mr H. G. Bell, of an anecdote told by Mr Hazlitt, and which is said to have had a foundation in real life.

at the unknown, and said, with much dignity, "I, sir, intended to have been Miss Sommers's partner." The stranger fixed his dark eye upon the squire, a slight smile curled on his lip, and, without answering, he passed on with his partner, and took his place in the dance. The squire stood stock-still for a moment, feeling as if he had just experienced a slight shock of electricity. When he recovered, he walked quietly away in search of Miss Wilhelmina Bouncer.

It was the custom in Hodnet for the gentlemen to employ the morning of the succeeding day in paying their respects to the ladies with whom they had danced on the previous evening. At these visits all the remarkable events of the ball were of course talked over. Criticisms were made upon the different dresses, commentaries were offered on the various modes of dancing, &c. We make no doubt that all this chit-chat was very interesting to the parties engaged in it; but our attention is more particularly devoted to the "odd-looking man" already spoken of.
